Face Recognition Improves Security

By: David Robertson, Ph.D.

Facial recognition technology has been widely used by the military for identity confirmation and surveillance. It is a unique biometric system because there is no contact necessary to gather images, unlike fingerprinting. Facial recognition, which is also used as a security feature on smartphones and computers, can be improved to more accurately identify a person based on their facial features. Researchers from the University of York FaceVar Lab are working on ways to improve facial recognition as a security feature that would also translate to improvements for military applications.

Automatic face recognition can be improved by copying the functions of the human brain. Security on smartphones is significantly improved if users store an 'average' photo of themselves. Combining different pictures of the user, rather than a single 'target' image, leads to much better recognition across all kinds of daily settings. [1]

Researchers [2] examined the performance of the 'face unlock' system on Samsung Galaxy phones. They found that the system was generally very good at rejecting imposters, but that it often failed to recognise the genuine owner too. However performance could be greatly improved, often to perfect levels, if users stored an 'average' of their own photos – formed by morphing together several different pictures of the user.

We know that people are very good at recognising their family and friends over a range of conditions. But, photo identification is often unreliable because we are rather bad at recognizing unfamiliar faces. In fact, even passport officers, who match people to their photos every day, are rather poor at doing this. In an earlier study [3] officers with up to 20 years of experience were no better than untrained students.

If people are good with familiar, and poor with unfamiliar faces, then it ought to be possible to copy this "familiarity advantage" in computer-based face recognition. We know that the brain forms abstract representations of the people it knows, and one way to emulate this is to use photographic averages, derived from several different photos of the same person. [4]

Researchers are improving facial recognition systems by creating “averages” of facial features.

David Robertson, PhD, lead author of this research, said “One striking aspect of this technique is that it works over different automatic matching algorithms – we are looking at *what* is matched not *how*. If your phone stores an average of your face, it shows significant recognition improvements across all kinds of conditions – inside and out, as well as in difficult lighting. It is very interesting that performance can be so much improved by copying a simple trick performed by the

brain.”

Continuing growth of facial databases would allow users of facial recognition technology to create better facial averages which would assist in military and first responder identification.

About the Author:

Dr. David Robertson received a degree in Psychology from the University of

Glasgow and his Ph.D. from University College London. He has worked with the FaceVar Lab since October 2013 and his focus is on improving unfamiliar face recognition in real-world environments.

Individual images of the same person can look very different. Averaging these together produces a stable image, which will match a much wider range of the user's face—improving security. (Image courtesy of David Robertson)

HDIAC publishes short articles (spotlights) every two weeks on www.hdiac.org. Spotlights are high-level, short summaries of technologies, research, or events in our eight focus areas. They are typically one to two pages in length and include at least one picture for the homepage slider. Additional pictures are not required but are recommended, should support the text, and will be placed in the spotlight. All pictures must be high resolution, approved and released for publication to HDIAC, and credited. Any references should be fully

cited at the end of the spotlight in APA format. Spotlights must be free of political opinion/positions, refrain from promoting a specific product or company, and not editorialize. The spotlight and any associated references will be added to the HDIAC collection.

The spotlights are published on hdiac.org along with a downloadable PDF versions and are posted to HDIAC's twitter and LinkedIn accounts. Authors are encouraged to visit the HDIAC website to

download and display the pdf. The spotlights can be re-published after they have been taken off the HDIAC website, and we appreciate citing HDIAC as the original source.

To submit a spotlight, you can send a complete spotlight to Jessica Hill (jhill@hdiac.org). If you have an idea for a spotlight and would like to check that it falls within our focus areas, you can also email the idea to the same address.
