# BIO/CS 471 – Algorithms for Bioinformatics

## Physical Mapping of DNA

# Landmarks on the genome

- Identify the order and/or location of sequence landmarks on the DNA

## Restriction Enzyme Digests

## Hybridization Mapping

# Producing a map of the genome

---

# Restriction Fragment Mapping

---

A:

3	8	6	10
---	---	---	----

B:

4	5	11	7
---	---	----	---

A + B:

3	1	5	2	6	3	7
---	---	---	---	---	---	---

# Set Partitioning

---

- The *Set Partition Problem*
  - Input:  $X = \{x_1, x_2, x_3, \dots, x_n\}$
  - Output: Partition of  $X$  into  $Y$  and  $Z$  such that  $\Sigma Y = \Sigma Z$
- This problem is NP Complete
- Suppose we have  $X = \{3, 9, 6, 5, 1\}$ 
  - Can we recast the problem as a double digest problem?

# Reduction from Set Partition

---

- $X = \{3, 9, 6, 5, 1\}$

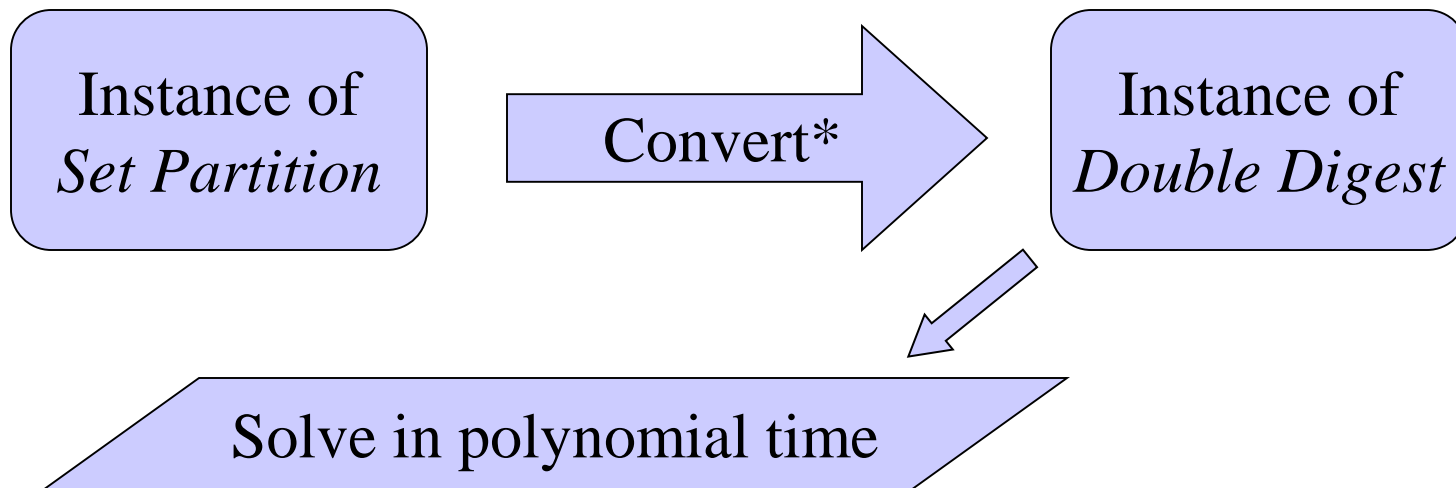

---

9	3	5	6	1
12		12		
9	3	5	6	1

# NP-Completeness

---

- Suppose we could solve the Double Digest Problem in polynomial time...

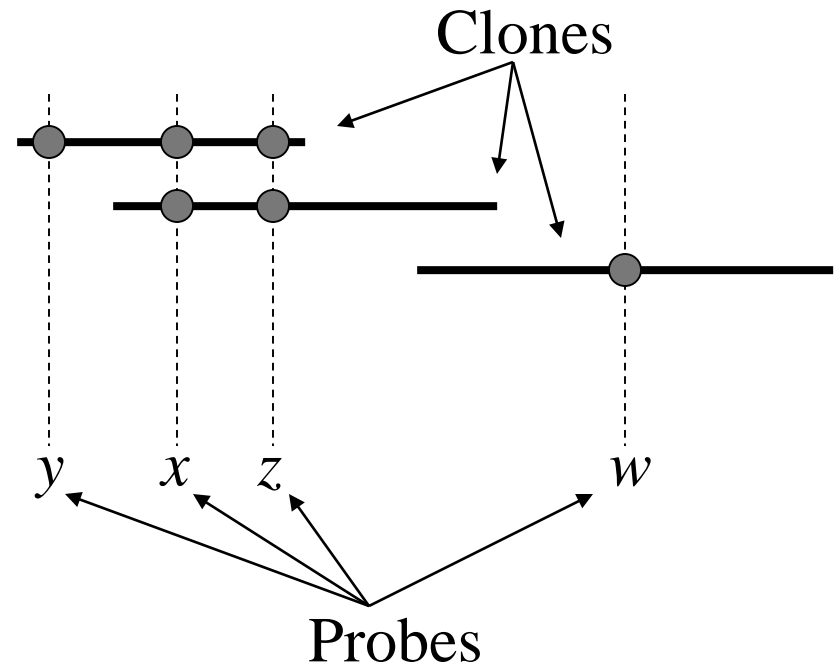

*\*polynomial time conversion*

# Hybridization Mapping

- The sequence of the clones remains unknown
- The relative order of the probes is identified
- The sequence of the probes is known in advance

# Interval graph representation

---

Becomes a *graph coloring* problem, which is (you guessed it) NP-Complete

# Simplifying Assumptions

---

- Probes are unique
  - Hybridize only once along the target DNA
- There are no errors
- Every probe hybridizes at every possible position on every possible clone

# Consecutive Ones Problem (C1P)

Rearrange the columns such that all the ones in every row are together:

Clones:

	Probes								
	$c_1$	$c_2$	$c_3$	$c_4$	$c_5$	$c_6$	$c_7$	$c_8$	$c_9$
$l_1$	1	1	0	1	1	0	1	0	1
$l_2$	0	1	1	1	1	1	1	1	1
$l_3$	0	1	0	1	1	0	1	0	1
$l_4$	0	0	1	0	0	0	0	1	0
$l_5$	0	0	1	0	0	1	0	0	0
$l_6$	0	0	0	1	0	0	1	0	0
$l_7$	0	1	0	0	0	0	1	0	0
$l_8$	0	0	0	1	1	0	0	0	1

# An algorithm for *CIP*

---

1. Separate the rows (clones) into *components*
2. Permute the components
3. Merge the permuted components

	$c_1$	$c_2$	$c_3$	$c_4$	$c_5$	$c_6$	$c_7$	$c_8$	$c_9$
$l_1$	1	1	0	1	1	0	1	0	1
$l_2$	0	1	1	1	1	1	1	1	1

$$S_1 = \{1, 2, 4, 5, 7, 9\}$$

$$S_2 = \{2, 3, 4, 5, 6, 7, 8, 9\}$$

# Partitioning clones into components

---

- Component graph  $G_c$ 
  - Nodes correspond to clones
  - Connect  $l_i$  and  $l_j$  iff:
    1.  $S_i \cap S_j \neq \emptyset$
    2.  $S_i \not\subset S_j$
    3.  $S_j \not\subset S_i$

# Component Graph

	$c_1$	$c_2$	$c_3$	$c_4$	$c_5$	$c_6$	$c_7$	$c_8$	$c_9$
$l_1$	1	1	0	1	1	0	1	0	1
$l_2$	0	1	1	1	1	1	1	1	1
$l_3$	0	1	0	1	1	0	1	0	1
$l_4$	0	0	1	0	0	0	0	1	0
$l_5$	0	0	1	0	0	1	0	0	0
$l_6$	0	0	0	1	0	0	1	0	0
$l_7$	0	1	0	0	0	0	1	0	0
$l_8$	0	0	0	1	1	0	0	0	1

*Here, connected components are labeled with greek letters.*

# Assembling a component

- Consider only row 1 of the following:

	$c_1$	$c_2$	$c_3$	$c_4$	$c_5$	$c_6$	$c_7$	$c_8$
$l_1$	0	1	0	0	0	0	1	1
$l_2$	0	1	0	0	1	0	1	0
$l_3$	1	0	0	1	0	0	1	1

- Placing all of the ones together, we can place columns 2, 7, and 8 in any order

$$l_1 \rightarrow \dots \begin{matrix} \{2, 7, 8\} \\ 0 \end{matrix} \begin{matrix} \{2, 7, 8\} \\ 1 \end{matrix} \begin{matrix} \{2, 7, 8\} \\ 1 \end{matrix} \begin{matrix} 1 \\ 0 \end{matrix} \dots$$

## Row 2

---

- Because of the way we have constructed the component,  $l_2$  will have some columns with 1's where  $l_1$  has 1's, and some where  $l_2$  does not.
- Shall we place the new 1's to the right or left?
- Doesn't matter because the reverse permutation is the same answer.

# Adding row 2

	$c_1$	$c_2$	$c_3$	$c_4$	$c_5$	$c_6$	$c_7$	$c_8$
$l_1$	0	1	0	0	0	0	1	1
$l_2$	0	1	0	0	1	0	1	0
$l_3$	1	0	0	1	0	0	1	1

$$S_1 = \{2, 7, 8\}$$

$$S_2 = \{2, 5, 7\}$$

				{5}		{2, 7}		{2, 7}		{8}		
$l_1$	$\rightarrow$	...	0	0		1		1		1	0	...
$l_2$	$\rightarrow$	...	0	1		1		1		0	0	...

- Placing column 5 to the left partially resolves the {2, 7, 8} columns

# Additional Rows

---

- Select a new row  $k$  from the component such that edges  $(i, j)$  and  $(i, k)$  exist for two already added rows  $i$ , and  $k$ .

- Look at the relationship between  $i$  and  $k$ , and between  $i$  and  $j$  to determine if  $k$  goes on the **same side** or the **opposite side** of  $i$  as  $j$ .

# Definitions

---

- Let  $x \cdot y = |S_x \cap S_y|$
- Place  $i$  on the **same** side as  $j$  if
$$j \cdot k < \min(j \cdot i, i \cdot k)$$
- Else, place on the **opposite** side

# Placing Rows

		$c_1$	$c_2$	$c_3$	$c_4$	$c_5$	$c_6$	$c_7$	$c_8$
$j \rightarrow$	$l_1$	0	1	0	0	0	0	1	1
$i \rightarrow$	$l_2$	0	1	0	0	1	0	1	0
$k \rightarrow$	$l_3$	1	0	0	1	0	0	1	1

Place  $k$  on the **same** side as  $j$  if

$$l_1 \cdot l_3 < \min(l_1 \cdot l_2, l_2 \cdot l_3)$$

• Or:

$$2 < \min(2, 1)$$

So we place  $l_3$  on the **same** side of  $l_2$  as  $l_1$ , which is the right.

# Placing rows

	$c_1$	$c_2$	$c_3$	$c_4$	$c_5$	$c_6$	$c_7$	$c_8$
$l_1$	0	1	0	0	0	0	1	1
$l_2$	0	1	0	0	1	0	1	0
$l_3$	1	0	0	1	0	0	1	1

				{5}	{2}	{7}	{8}	{1,4}	{1,4}		
$l_1$	$\rightarrow$	...	0	0	1	1	1	0	0	0	...
$l_2$	$\rightarrow$	...	0	1	1	1	0	0	0	0	...
$l_3$	$\rightarrow$	...	0	0	0	1	1	1	1	0	...

- Repeat for every row in the component

# Joining Components

- New graph:  $G_m$  – the merge graph (*directed*)
  - Nodes are connected components of  $G_c$
  - Edge  $(\alpha, \beta)$  iff every set in  $\beta$  is a subset of a set in  $\alpha$

	$c_1$	$c_2$	$c_3$	$c_4$	$c_5$	$c_6$	$c_7$	$c_8$	$c_9$
$l_1$	1	1	0	1	1	0	1	0	1
$l_2$	0	1	1	1	1	1	1	1	1
$l_3$	0	1	0	1	1	0	1	0	1

# Constructing $G_m$

	$c_1$	$c_2$	$c_3$	$c_4$	$c_5$	$c_6$	$c_7$	$c_8$	$c_9$
$l_1$	1	1	0	1	1	0	1	0	1
$l_2$	0	1	1	1	1	1	1	1	1
$l_3$	0	1	0	1	1	0	1	0	1
$l_4$	0	0	1	0	0	0	0	1	0
$l_5$	0	0	1	0	0	1	0	0	0
$l_6$	0	0	0	1	0	0	1	0	0
$l_7$	0	1	0	0	0	0	1	0	0
$l_8$	0	0	0	1	1	0	0	0	1

# Properties of $G_m$

- All rows in  $\gamma$  will share the same disjoint/subset relationship with each row of  $\alpha$ 
  - Different components  $\rightarrow$  disjoint *or* subset
  - Same component  $\rightarrow$  shares a 1 column
  - That column matches in a row of  $\alpha$ , then subset, else disjoint

	$c_1$	$c_2$	$c_3$	$c_4$	$c_5$	$c_6$	$c_7$	$c_8$	$c_9$
$l_1$	1	1	0	1	1	0	1	0	1
$l_2$	0	1	1	1	1	1	1	1	1
$l_3$	0	1	0	1	1	0	1	0	1
$l_4$	0	0	1	0	0	0	0	1	0
$l_5$	0	0	1	0	0	1	0	0	0
$l_6$	0	0	0	1	0	0	1	0	0
$l_7$	0	1	0	0	0	0	1	0	0
$l_8$	0	0	0	1	1	0	0	0	1

# Ordering components

- Vertices without incoming edges: freeze their columns

$$\begin{array}{l}
 l_1 \rightarrow \dots \quad \{1\} \mid \quad \{2, 4, 5, 7, 9\} \mid \quad \{3,6,8\} \\
 \quad \quad \quad 1 \quad \mid \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \quad \mid \quad 0 \quad 0 \quad 0 \quad \dots \\
 l_2 \rightarrow \dots \quad 0 \quad \mid \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \quad \mid \quad 1 \quad 1 \quad 1 \quad \dots
 \end{array}$$

- Process the rest in topological order.
  - $\beta$  is a singleton and a subset

$$\begin{array}{l}
 l_1 \rightarrow \dots \quad \{1\} \mid \quad \{2, 4, 5, 7, 9\} \mid \quad \{3,6,8\} \\
 \quad \quad \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \quad \mid \quad 0 \quad 0 \quad 0 \quad \dots \\
 l_2 \rightarrow \dots \quad 0 \quad \mid \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \quad \mid \quad 1 \quad 1 \quad 1 \quad \dots \\
 l_3 \rightarrow \dots \quad 0 \quad \mid \quad 1 \quad 1 \quad 1 \quad 1 \quad 1 \quad \mid \quad 0 \quad 0 \quad 0 \quad \dots
 \end{array}$$

# Ordering Components (2)

---

- Find the leftmost column with a 1
- In the current assembly, find the rows that contain all ones for that column
- Merge the columns

⑧
