

Aspects of the molecular epidemiology of rabies in Zimbabwe and South Africa

by

Claude Taurai Sabeta

Submitted in partial fulfilment of the requirements for the degree of

**DOCTOR OF PHILOSOPHY
(MICROBIOLOGY)**

IN THE

**FACULTY OF NATURAL AND AGRICULTURAL SCIENCES
UNIVERSITY OF PRETORIA
PRETORIA**

July 2002

I certify that the thesis submitted to the University of Pretoria for the degree of PH. D. (Doctor of Philosophy) has not been previously submitted by me in respect of a degree at any other University.

Date: 24/07/02

SUMMARY

ASPECTS OF THE MOLECULAR EPIDEMIOLOGY OF RABIES IN ZIMBABWE AND SOUTH AFRICA.

By

CLAUDE TAURAI SABETA

Supervisor: Prof. L.H. Nel

Department of Microbiology and Plant Pathology

University of Pretoria

For the degree of Doctor of Philosophy

Rabies, one of the oldest recognised viral zoonotic diseases, is a fatal encephalomyelitis transmitted to man via contact with infected animals. Even today, rabies still is a disease of public health concern with many potentially preventable deaths occurring mainly in Asia, Africa and Latin America. Rabies and rabies-related viruses are members of the Lyssavirus genus, which comprises the rabies virus (genotype 1), Lagos bat virus (genotype 2), Mokola virus (genotype 3), Duvenhage virus (genotype 4), European bat lyssaviruses 1 and 2 (genotypes 5 and 6) and the Australian bat lyssavirus (genotype 7).

Antigenic and genetic studies have shown that rabies virus strains circulating in particular host species tend to undergo genetic adaptation and evolve into distinct biotypes that differ in antigenicity and pathogenicity. Two biotypes of rabies virus are recognised in southern Africa. The first, called the canid viruses, infect carnivores of the family *Canidae* (dogs, jackals and bat-eared foxes) and the second, the viverrid

viruses, infect carnivores of the family *Herpestidae* (the yellow mongoose *Cynictis penicillata* and the slender mongoose *Galerella sanguinea*).

In an endeavour to better understand the molecular epidemiology of lyssaviruses in Zimbabwe and South Africa, we analysed nucleotide sequences of the glycoprotein and the G-L intergenic region (rabies viruses) and the nucleoprotein gene (Mokola viruses). The main aim of the studies described in this thesis was to characterise lyssaviruses (genotypes 1 and 3) from Zimbabwe and compare them to those present in South Africa. In addition, we wanted to establish the role of the various rabies variants in rabies epizootics in the southern African subcontinent.

It could be shown from this study that all the southern African canid viruses were closely related, with no general distinction between viruses from any of the canid species. Despite the general overall similarity between the canid viruses, certain phylogenetic groupings were apparent and by association with host species, geography and year of isolation, certain groups could be identified as particular epidemiological cycles. A high genetic diversity was evident amongst viverrid rabies viruses, the opposite of our observation for canid viruses. The viverrid virus groups corresponded to geographical pockets that were independent of host species. Mokola viruses from Zimbabwe were shown to be different from those from South Africa and phylogenetic relationships of these viruses were related to their geographical location of origin.

This study has demonstrated the value of multinational surveillance and investigation in understanding the epidemiology of lyssaviruses in southern Africa and elsewhere in Africa. The results presented here will serve as basis for future studies on lyssaviruses in Africa and will contribute to the improved surveillance and control programs of rabies and Mokola viruses in the region.

Key words: molecular epidemiology / rabies / Zimbabwe / South Africa / Lyssavirus
/ Mokola / phylogeny / canid/ viverrid/biotype

ACKNOWLEDGEMENTS

My sincere gratitude to Professor Louis Nel, who introduced me to Molecular Virology and served as my promoter for my PHD studies. Professor Nel was a perfect example for scientific advancement and his enthusiasm, dedication and never failing support inspired me throughout my studies.

My sincere appreciation go to the Directorate of Central Veterinary Institute (CVL) Harare, Dr Ushewokunze-Obatolu, for granting me permission to work with virus isolates from their collection. To Dr Bingham, I say thank you for assistance with virus culture and the fruitful discussions regarding rabies epidemiology in Zimbabwe. His invaluable experience with rabies epidemiology in southern Africa and his contributions made this a more exciting area for study. I would also like to thank Dr Javangwe, from the CVL, for his assistance with typing viverrid virus isolates for these genetic studies. Thanks to my employer, the University of Zimbabwe, for granting me the study leave to conduct this research at the University of Pretoria.

The Agricultural Research Council, the Foundation for Research and Development for research funds and DAAD through the Ansti-Unesco Nairobi office, for their generous financial support. The University of Zimbabwe also contributed towards part of my research and travel costs through the SIDA-SAREC funds.

To my friends who supported me, your friendship is greatly appreciated. In particular, I would like to thank my colleagues from the molecular virology laboratory; Jonathan Keytel, Wanda Markotter and Jeanette Jacobs for encouragement when the odds were low. Thanks to Julian Jaftha, Marinda Oosthuisen and Dr Jacques Theron for their assistance. To Fourie Joubert, many thanks for your

assistance with computer analysis. Finally, I would like to give special thanks to my wife Florence who encouraged me when I needed it most, to my son and daughter, Panashe and Varaidzo, of whom I sacrificed a lot of time without attending to because of the commitments to this work.

**CHAPTER TWO
MOLECULAR EPIDEMIOLOGY OF CANINE RABIES IN ZIMBABWE AND
SOUTH AFRICA.**

2.1	Summary	37
2.2	Introduction	38
2.3	Materials and methods	41
2.3.1	Viruses and virus isolation	41
2.3.2	Primers for RT-PCR	46
2.3.3	Total RNA extraction	46
2.3.4	cDNA synthesis	47
2.3.5	PCR	48
2.3.6	Nucleotide sequencing	48
2.3.7	Phylogenetic analysis	50
2.3.8	Nucleotide sequence accession numbers	52
2.4	Results	52
2.4.1	Virus isolates, virus propagation, RNA extraction, cDNA synthesis and amplification	52
2.4.2	Phylogenetic analyses	52
2.5	Discussion	64

**CHAPTER THREE
MOLECULAR EPIDEMIOLOGY OF VIVERRID RABIES IN ZIMBABWE
AND SOUTH AFRICA.**

3.1	Summary	69
3.2	Introduction	70
3.3	Materials and methods	73
3.3.1	Rabies viruses and virus isolation.....	73
3.3.2	Primer selection	76
3.3.3	Total RNA extraction, cDNA synthesis and RT-PCR.....	76
3.3.4	Nucleic acid sequencing and phylogenetic analysis	76
3.3.5	Nucleotide sequence accession numbers	77
3.4	Results	77
3.4.1	Virus isolates, RNA preparation, cDNA synthesis and amplification	77
3.4.2	Nucleotide sequence determination	77
3.5	Phylogenetic analyses	78
3.6	Discussion	90

**CHAPTER FOUR
GENOTYPIC ANALYSES OF MOKOLA VIRUSES FROM ZIMBABWE AND
SOUTH AFRICA.**

4.1	Summary	94
4.2	Introduction	95
4.3	Materials and methods	96
4.3.1	Viruses and virus isolation	96
4.3.2	Primer selection	98
4.3.3	Viral RNA extraction and cDNA synthesis	98
4.3.4	PCR amplification	99

4.3.5	Purification of PCR amplicons and nucleic acid sequencing	99
4.3.6	Phylogenetic analysis.....	99
4.4	Results	100
4.4.1	Mokola virus isolates, virus propagation and monoclonal antibody typing	100
4.4.2	Viral RNA extraction, cDNA synthesis and PCR	100
4.4.3	Purification of PCR products, nucleic acid sequencing and phylogenetic Analysis	100
4.4.4	Accession numbers	101
4.5	Discussion	105
