TREC *Transportation Insight for Vibrant Communities*

Metro

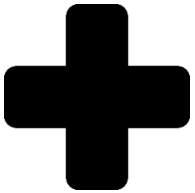
Background

Portland State UNIVERSITY

Why model pedestrian travel?

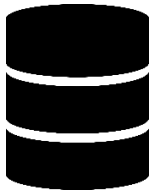
plan for pedestrian investments
& non-motorized facilities

mode shifts



health & safety

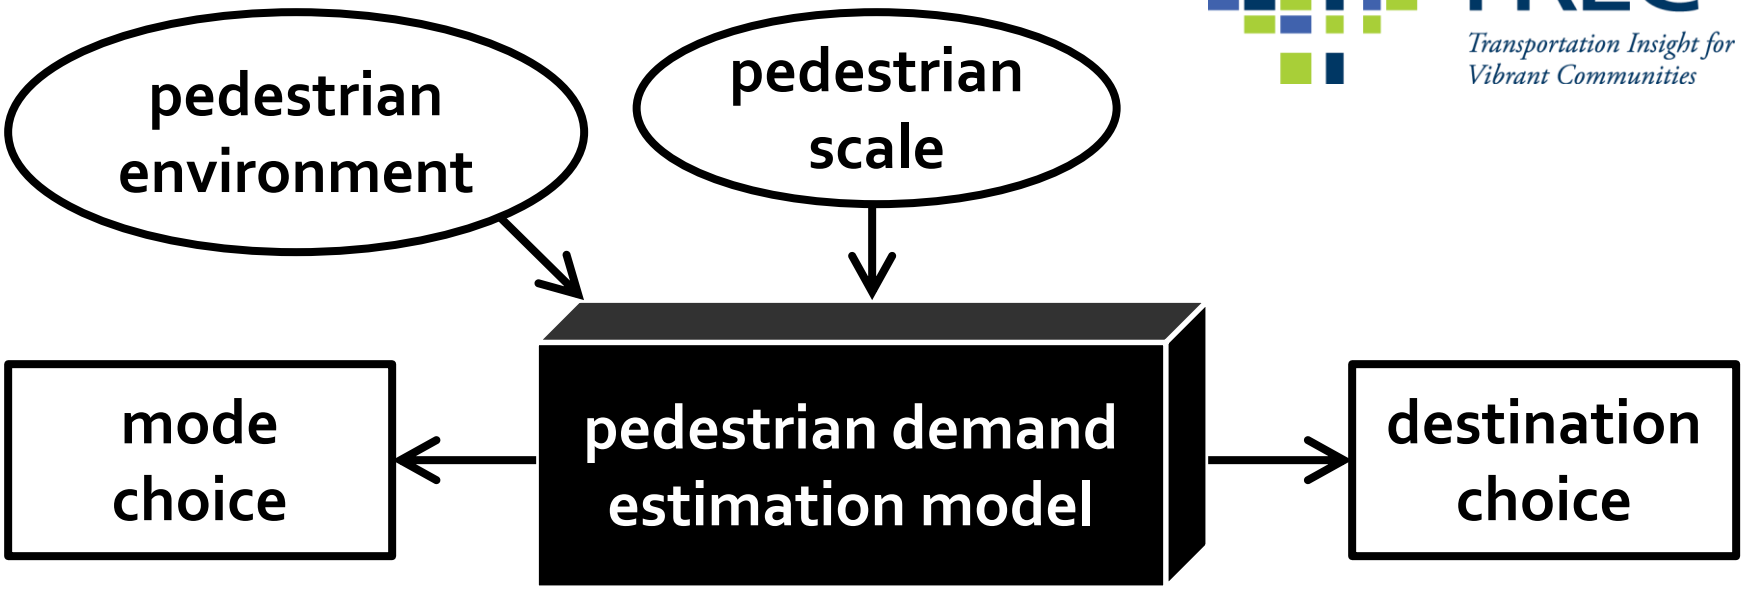
greenhouse
gas emissions



new data

Project overview

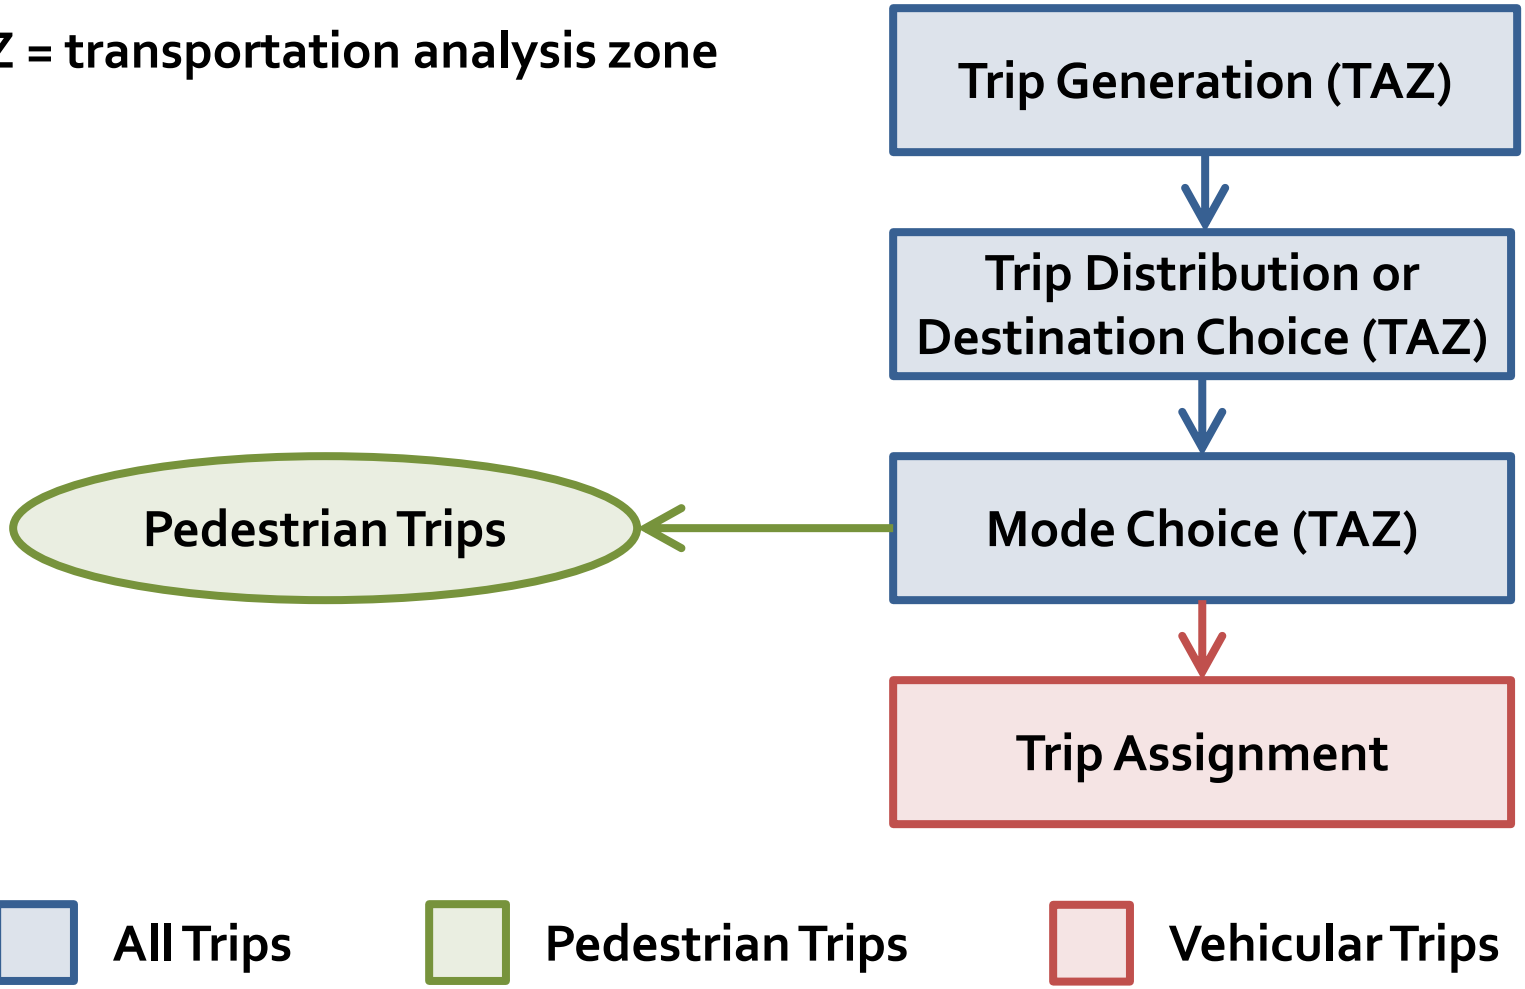
- Metro: metropolitan planning organization for Portland, OR
- Two research projects



Current method

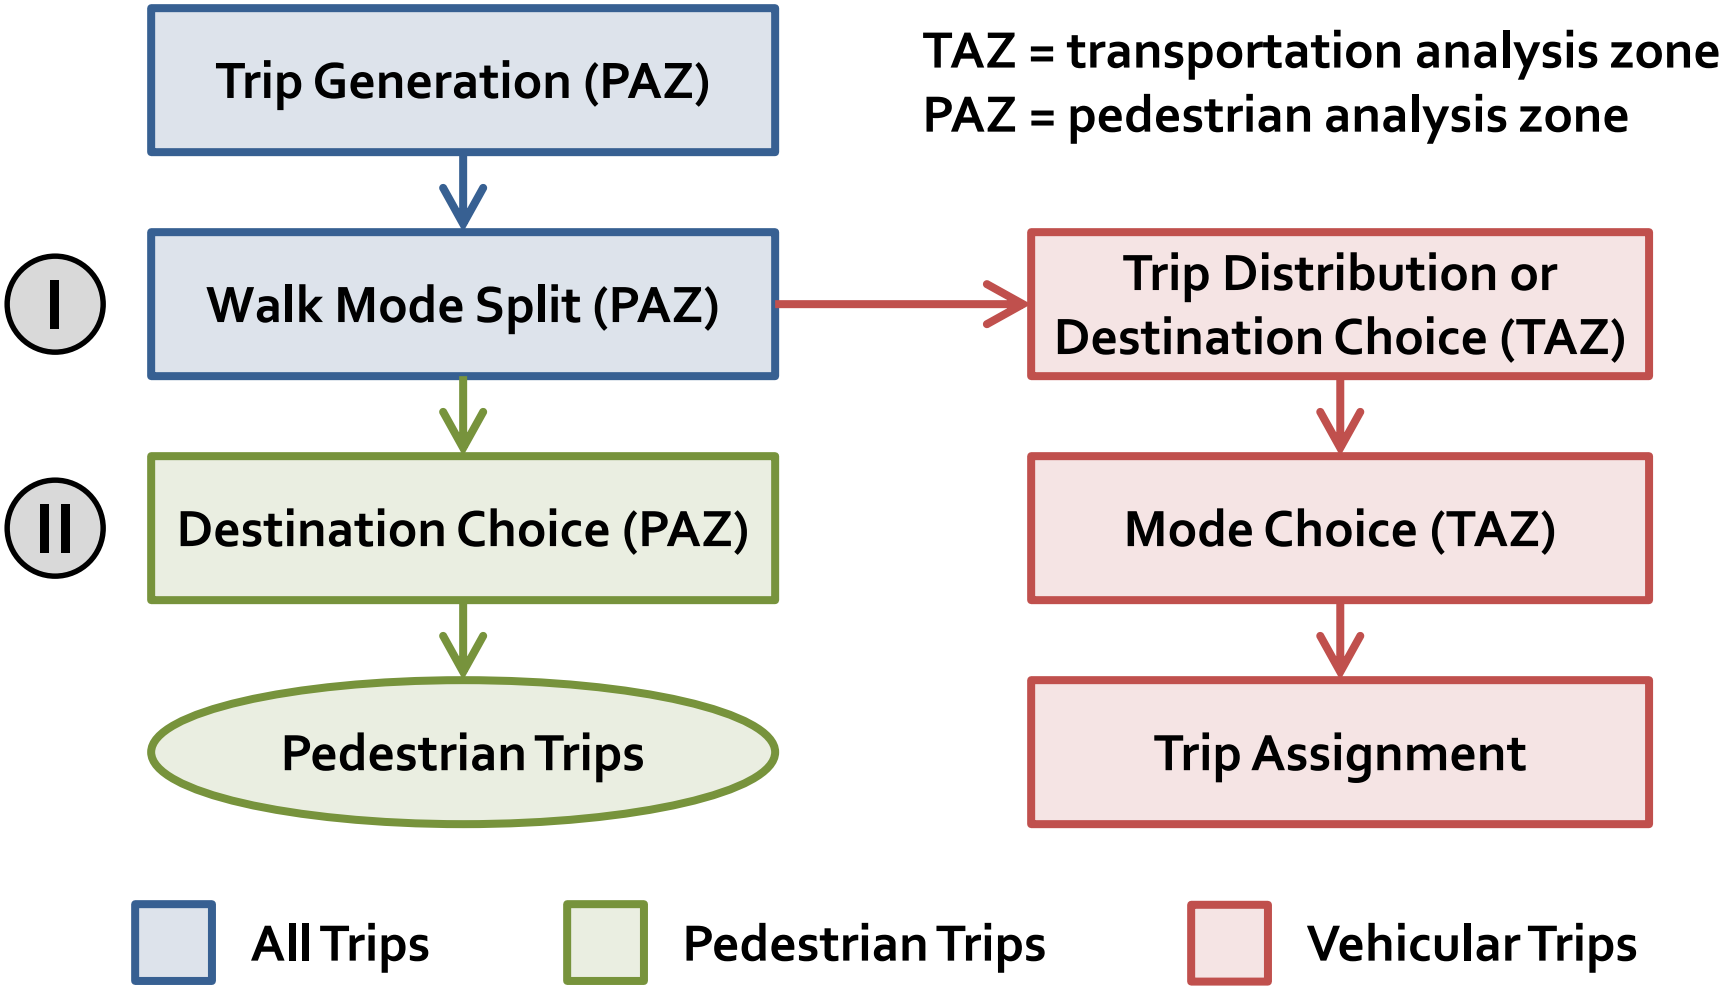
Portland State UNIVERSITY

TAZ = transportation analysis zone

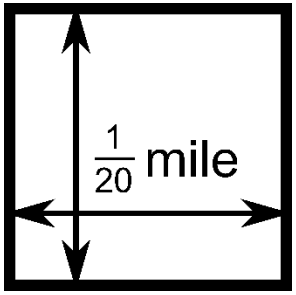


New method

Portland State UNIVERSITY



Pedestrian analysis zones

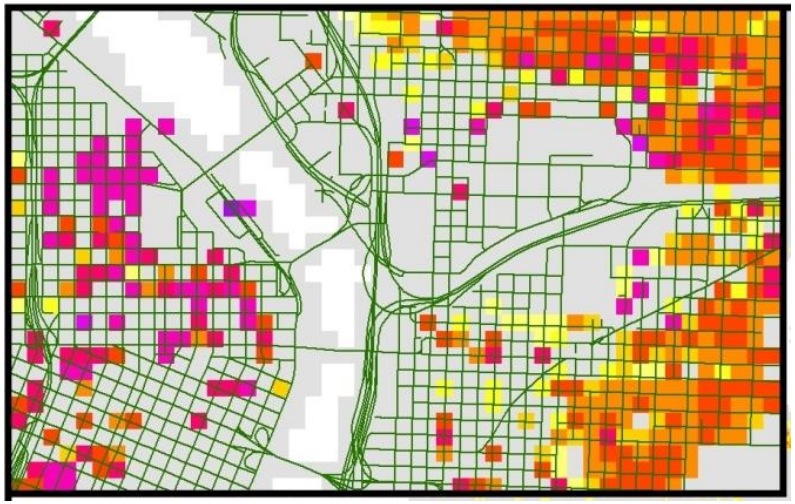


$^{1}/_{20}$ mile = 264 feet ≈ 1 minute walk

Metro: ~2,000 TAZs → ~1.5 million PAZs

TAZs

PAZs



Home-based work trip productions

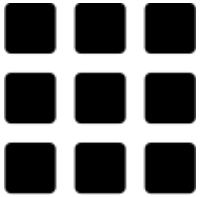
Pedestrian environment

Portland State UNIVERSITY

Pedestrian Index of the Environment (PIE)

PIE is a 20–100 score total of 6 dimensions, calibrated to observed walking activity:

People and job density



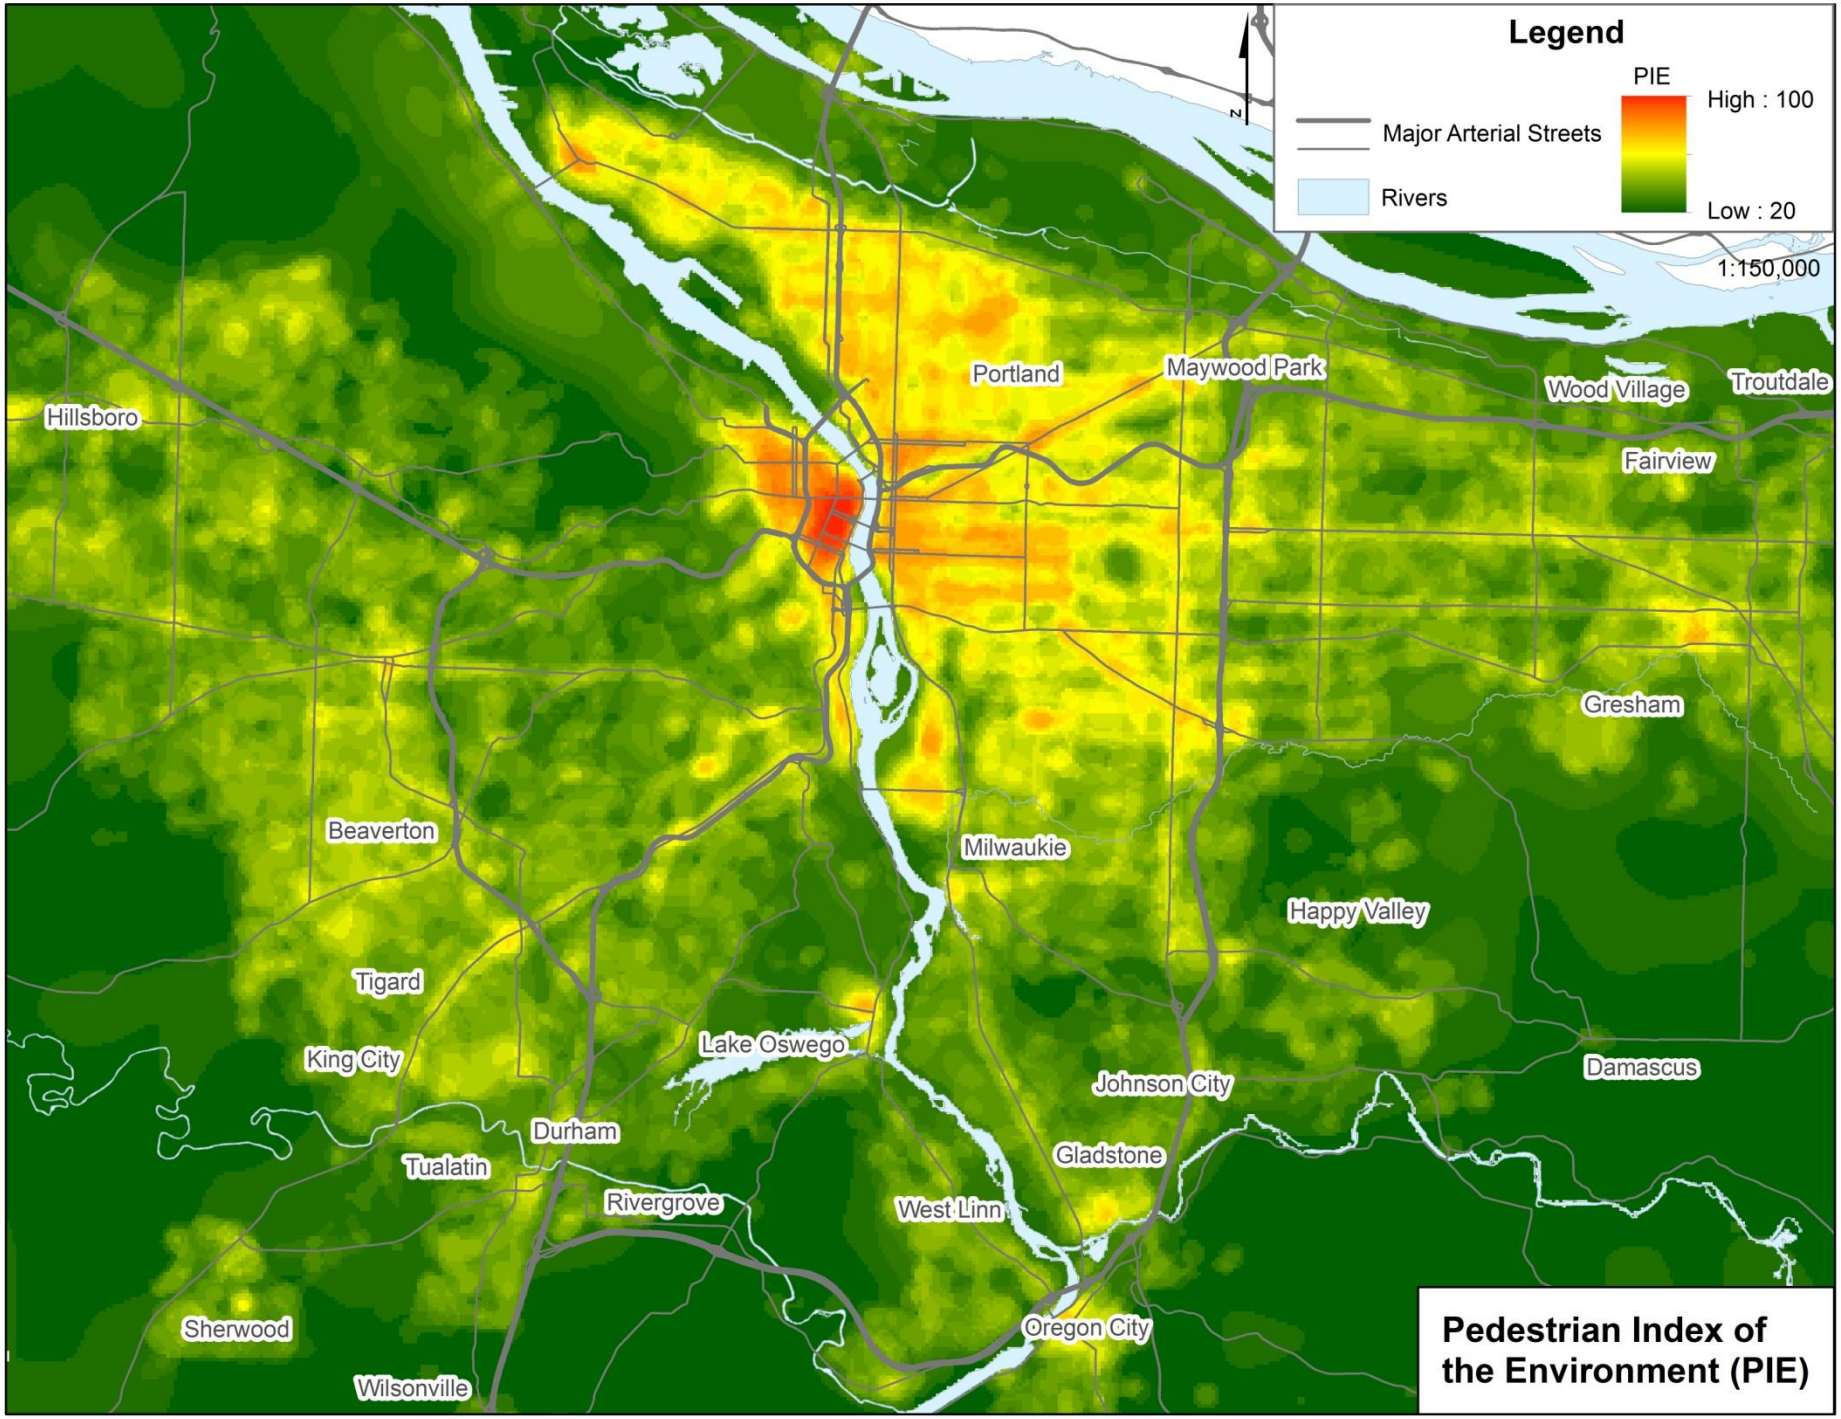
Block size

Transit access

Sidewalk extent

Urban living infrastructure

Comfortable facilities

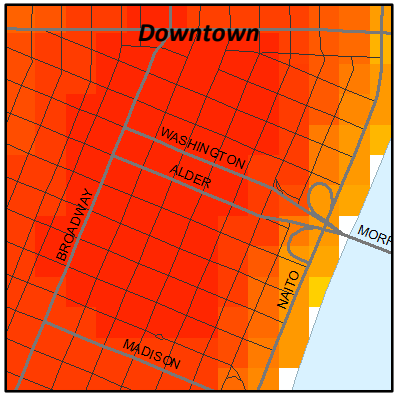


Legend
PIE
High : 100
Low : 20
Major Arterial Streets
Rivers
1:150,000
Portland
Maywood Park
Wood Village
Troutdale
Fairview
Hillsboro
Gresham
Beaverton
Milwaukie
Happy Valley
Tigard
King City
Lake Oswego
Johnson City
Damascus
Durham
Tualatin
Gladstone
Rivergrove
West Linn
Sherwood
Oregon City
Wilsonville
Pedestrian Index of the Environment (PIE)

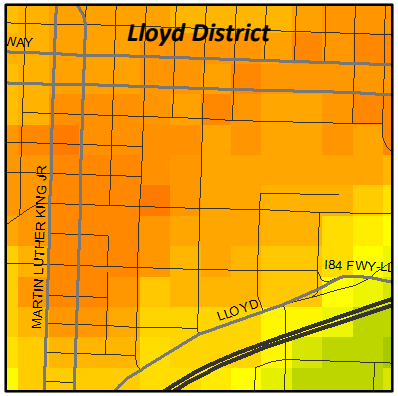
Visualizing PIE

Portland State UNIVERSITY

100 – Downtown core



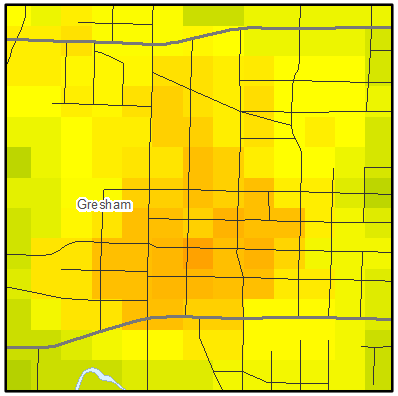
80 – Major neighborhood centers



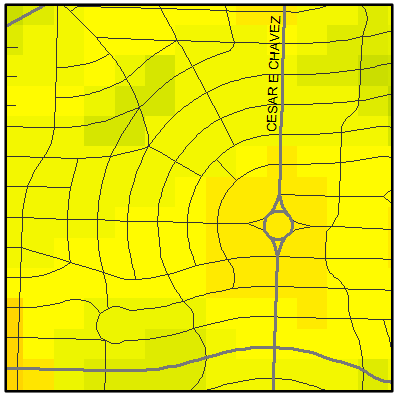
Visualizing PIE

Portland State UNIVERSITY

70 – Suburban downtowns



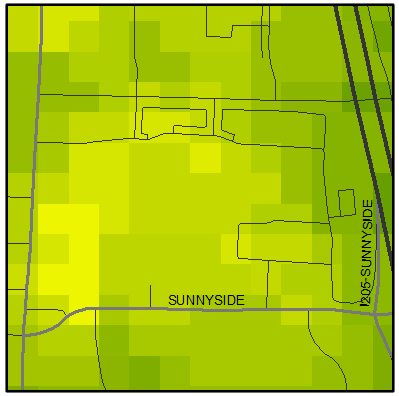
60 – Residential inner-city neighborhoods



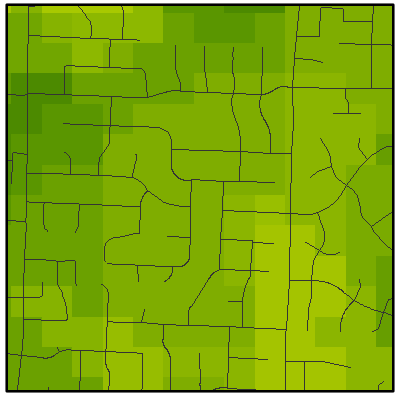
Visualizing PIE

Portland State UNIVERSITY

50 – Suburban shopping malls



40 – Suburban neighborhoods/subdivisions

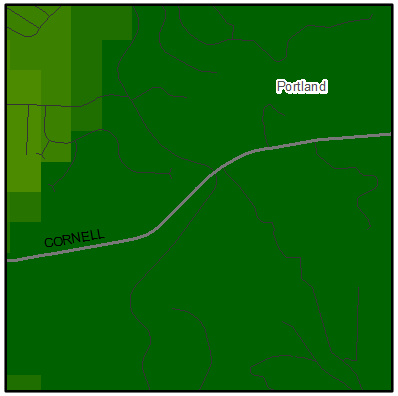


Visualizing PIE

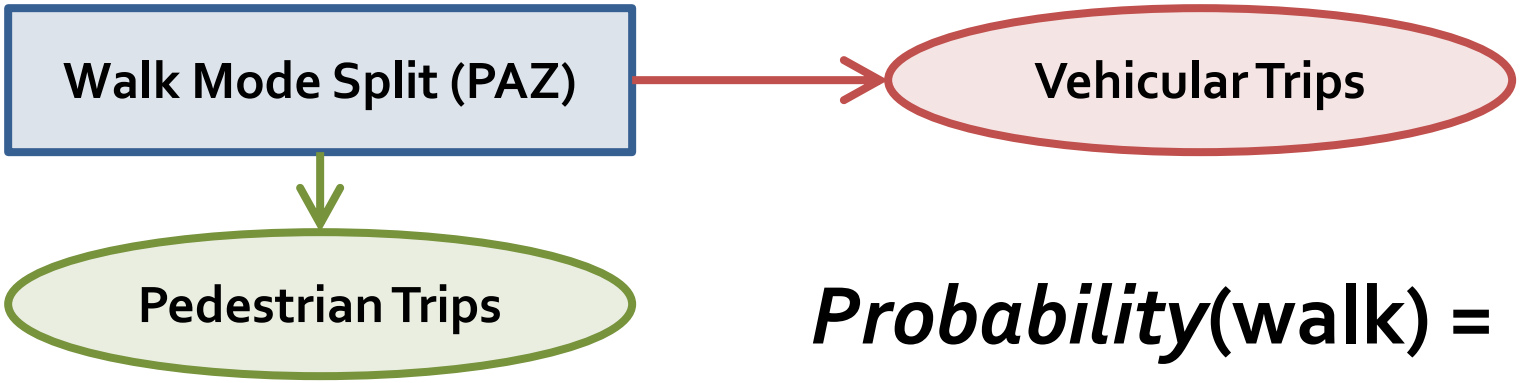
Portland State UNIVERSITY

30 – Isolated business and light industry

20 – Rural, undeveloped, forested



① Walk mode split



***Probability*(walk) = *f*(traveler characteristics, pedestrian environment)**

- Data: 2011 OR Household Activity Survey: (4,000 walk trips) ÷ (50,000 trips) = 8% walk
- Model: binary logistic regression

Walk Mode Split Results

Portland State UNIVERSITY

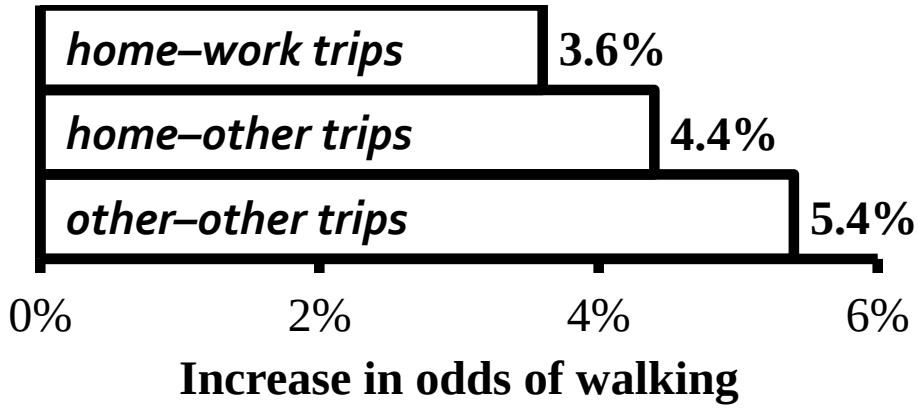
Household characteristics

+ positively related to walking	*– negatively related to walking*
number of children	age of household
	vehicle ownership

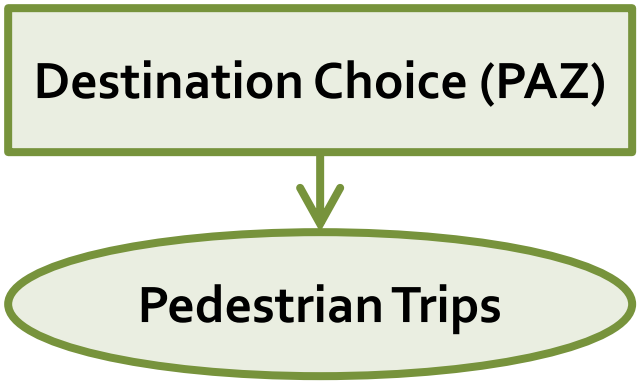
Pedestrian environment

+ positively related to walking

+ 1 point PIE associated with:



II Destination choice

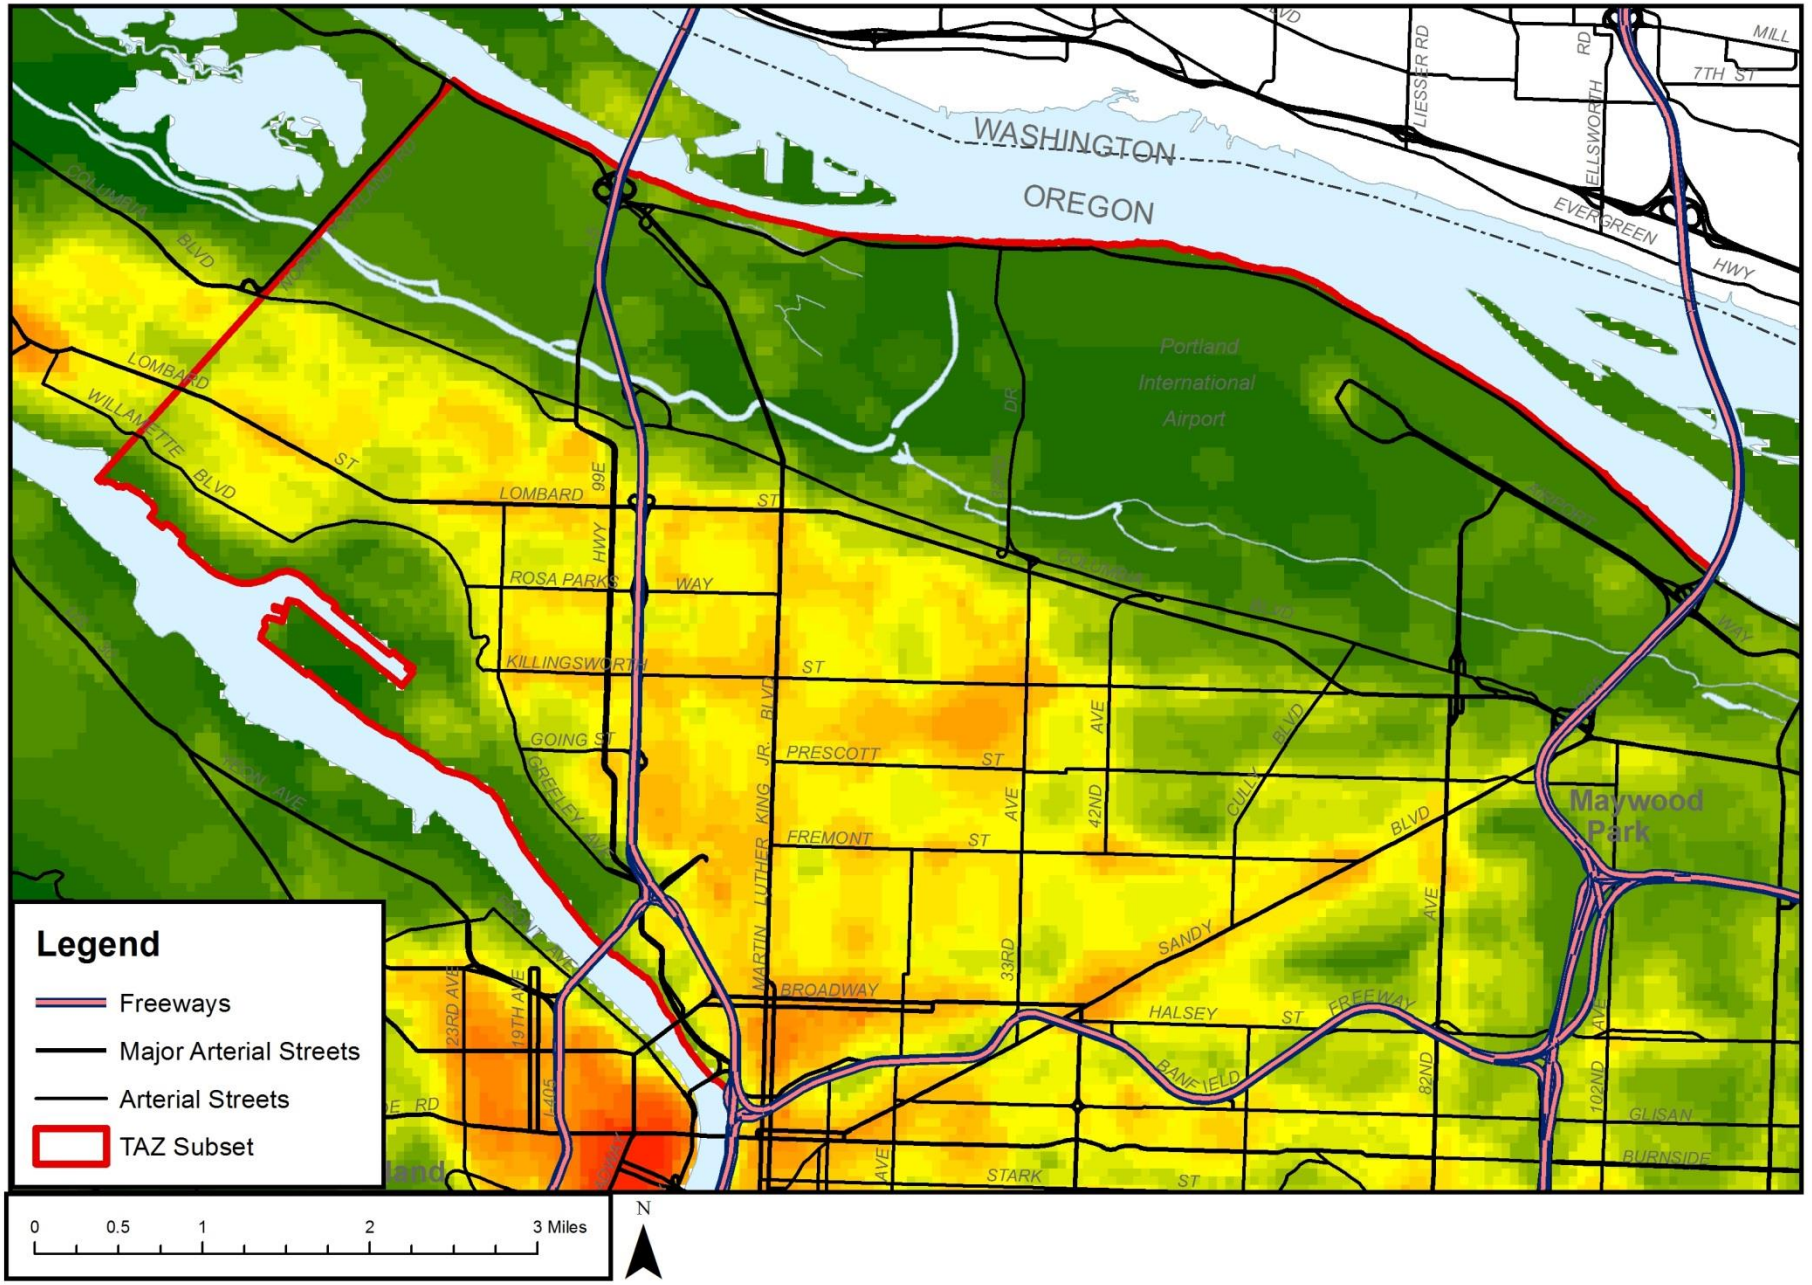


Prob(dest.) = *function of*…

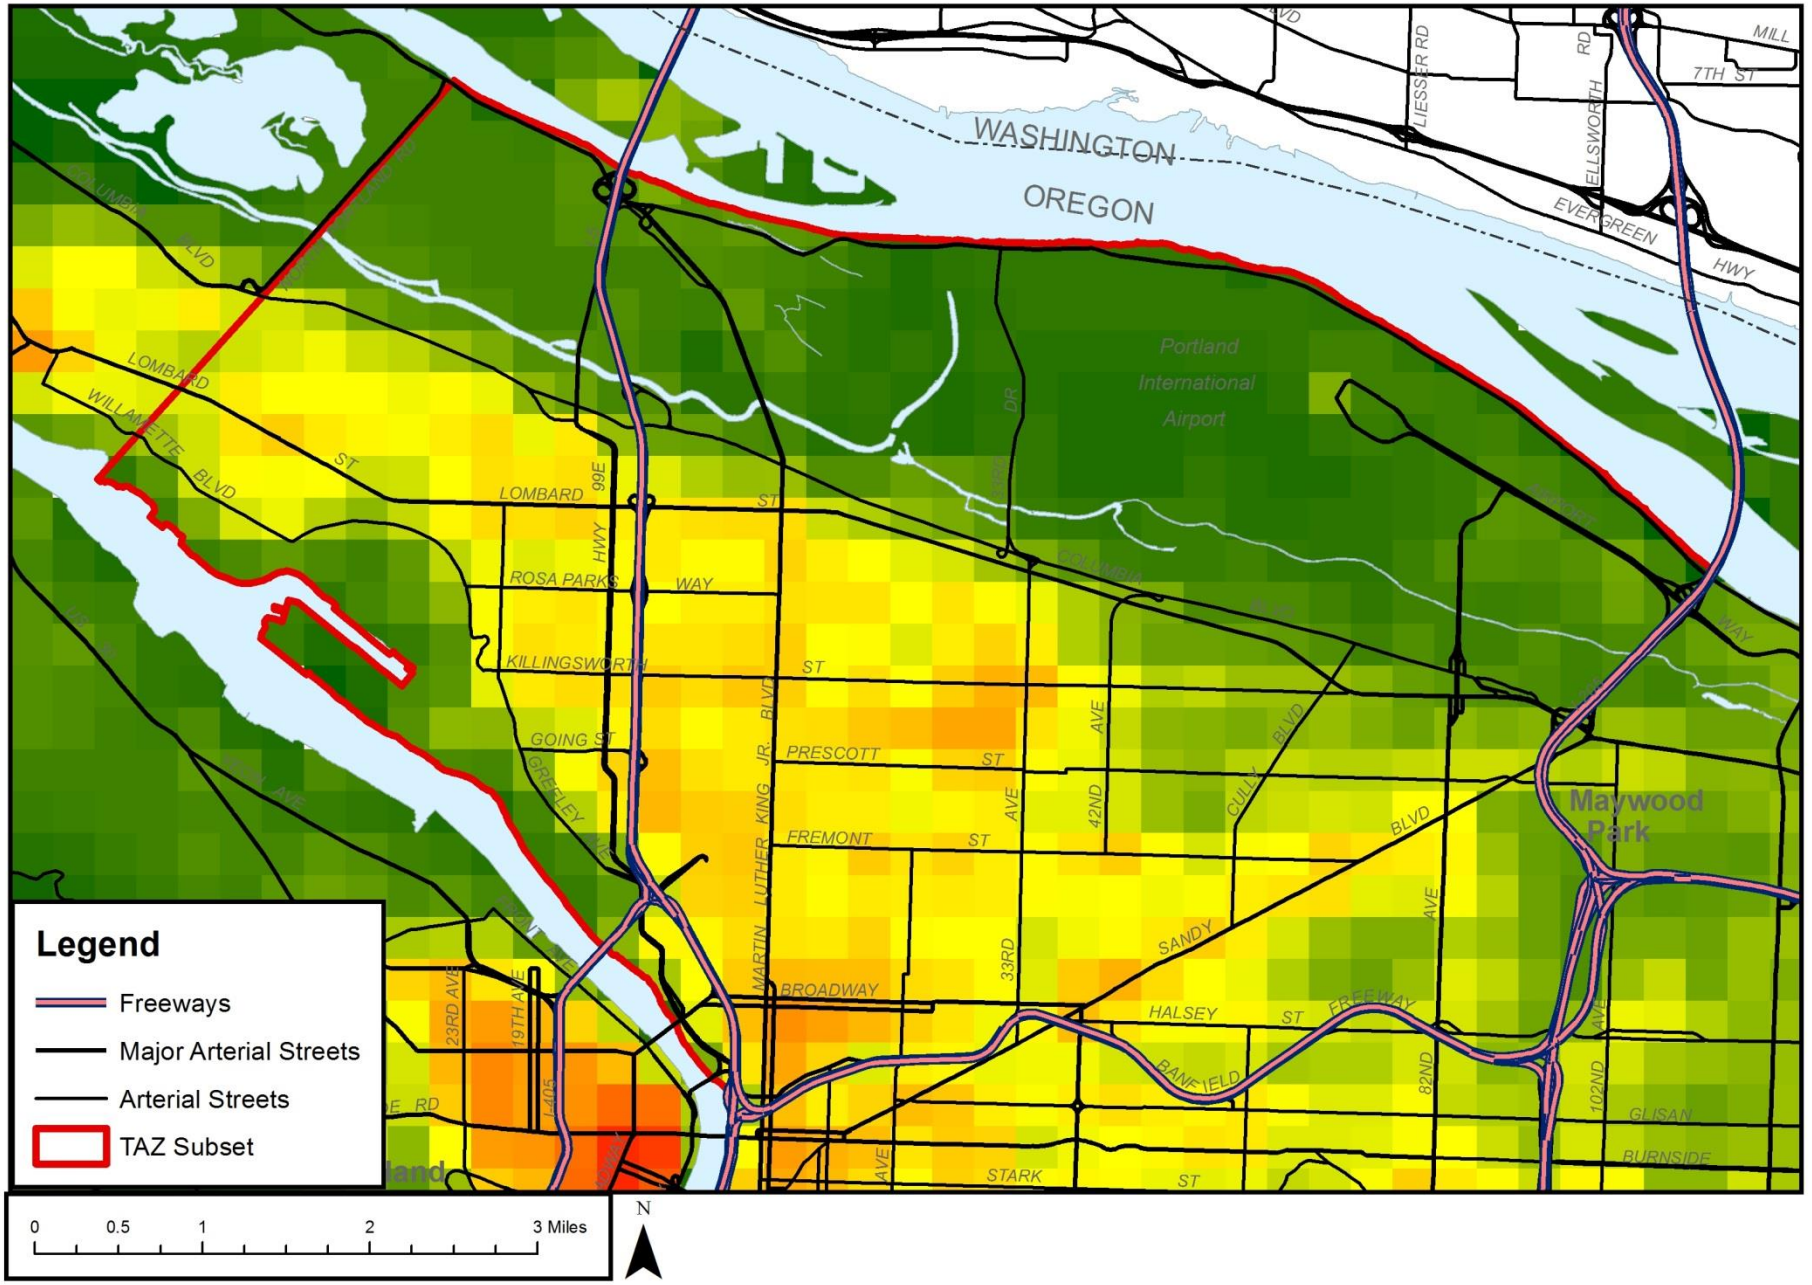
- network distance
- size (# of destinations)
- pedestrian environment
- traveler characteristics

- *Data*: 2011 OHAS (4,000 walk trips)
- *Method*: multinomial logit model
  random sampling
- *Spatial unit*: super-pedestrian analysis zone
- Models estimated for 6 trip purposes

Example of PIE by PAZs in NE Portland Sub-area



Example of Avg. PIE by SuperPAZs in NE Portland Sub-area



DC Model Specification

Portland State UNIVERSITY

Key variables

Impedance

Network distance btw. zones

Attractiveness

Employment by category (within ln)

Add'l variables

Ped supports

PIE

Ped barriers

Slope, x-ings, fwy

Traveler attributes

Destination choice results

Freeway (y)	*n.s.*	-0.95**	*n.s.*	*n.s.*	*n.s.*	0.27’
% Industrial jobs	-1.00*	-1.82**	*n.s.*	-0.40’	-1.66**	*n.s.*

(‘ = $p < 0.10$, * = $p < 0.05$, ** = $p < 0.01$) n.s. = not significant

Ped supports: PIE increases odds of dest choice for many trip purposes

Results : ped variables

Portland State UNIVERSITY

	HB Work	HB Shop	HB Rec	HB Other	NHB Work	NHB NW
PIE (avg)	0.03**	*n.s.*	*n.s.*	0.03**	0.02*	0.02**
Avg. slope (°)	*n.s.*	-0.20*	*n.s.*	-0.42**	-0.16**	*n.s.*
Major-major xing (y)	*n.s.*	0.60**	0.42’	*n.s.*	*n.s.*	*n.s.*
Freeway (y)	*n.s.*	-0.95**	*n.s.*	*n.s.*	*n.s.*	0.27’
% Industrial jobs	-1.00*	-1.82**	*n.s.*	-0.40’	-1.66**	*n.s.*

(‘ = $p < 0.10$, * = $p < 0.05$, ** = $p < 0.01$) n.s. = not significant

Ped barriers:

Slope, major crossings, and presence of freeways have mixed impacts

Results : ped variables

	HB Work	HB Shop	HB Rec	HB Other	NHB Work	NHB NW
PIE (avg)	0.03**	*n.s.*	*n.s.*	0.03**	0.02*	0.02**
Avg. slope (°)	*n.s.*	-0.20*	*n.s.*	-0.42**	-0.16**	*n.s.*
Major-major xing (y)	*n.s.*	0.60**	0.42’	*n.s.*	*n.s.*	*n.s.*
Freeway (y)	*n.s.*	-0.95**	*n.s.*	*n.s.*	*n.s.*	0.27’
% Industrial jobs	-1.00*	-1.82**	*n.s.*	-0.40’	-1.66**	*n.s.*

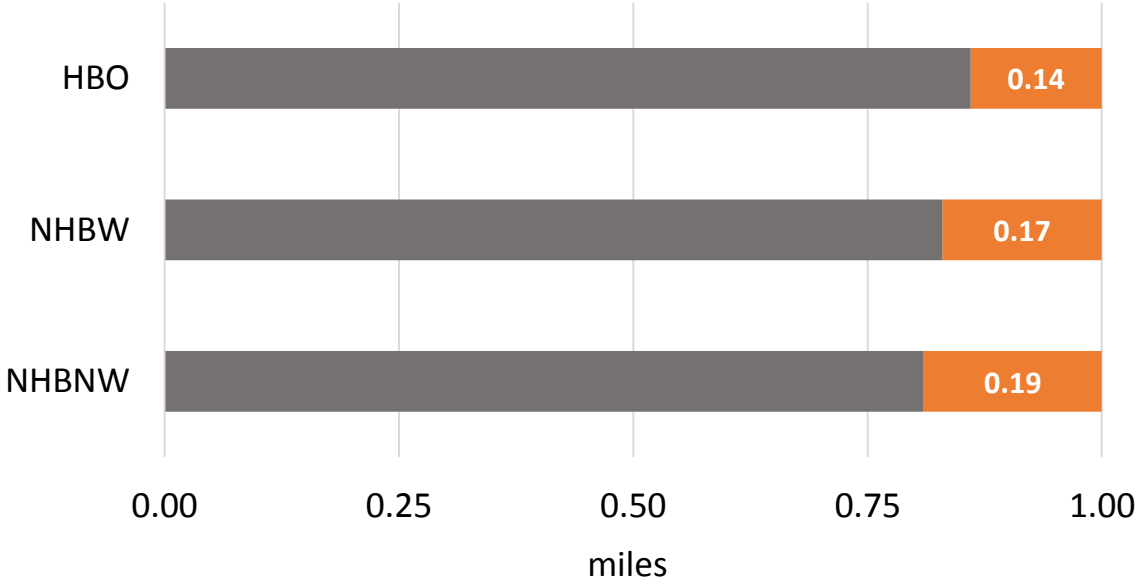
(‘ = $p < 0.10$, * = $p < 0.05$, ** = $p < 0.01$) n.s. = not significant

Ped barriers:

Ratio of industrial jobs to total jobs suggests industrial uses deter ped destination choices

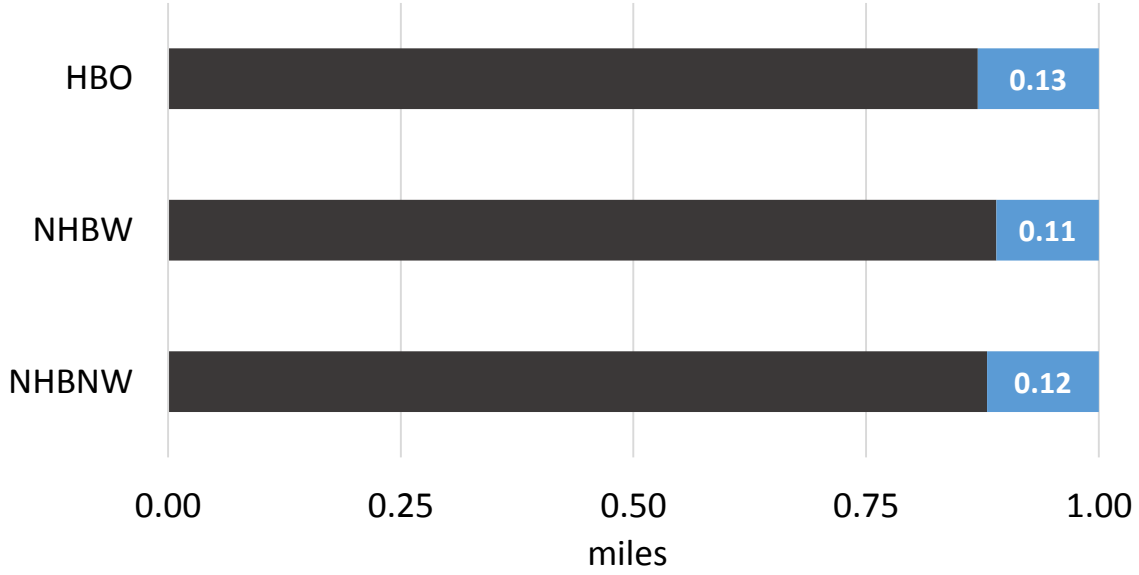
Some Interpretation

Equivalent distance reductions from
2 * (# destinations)



Some Interpretation

Equivalent distance reductions from
PIE + 10



Conclusions

Portland State UNIVERSITY

- One of the first studies to examine destination choice of pedestrian trips
- Pedestrian scale analysis w/ pedestrian-relevant variables
- Distance and size have the most influence on ped. dest. choice
- Supports and barriers to walking also influence choice
- Traveler characteristics moderate distance effect

Future work

Portland State UNIVERSITY

- Model improvements
  - Choice set generation method & sample sizes
  - Explore non-linear effects & other interactions
- Model validation & application
- Predict potential pedestrian paths
- Test method in other region(s)
- Incorporation into Metro trip-based model
