Cloud Computing

Cloud computing has emerged as a dominant paradigm, widely adopted by enterprises. Clouds provide on-demand access to computing utilities, an abstraction of unlimited computing resources, and support for on-demand scale-up, scale-down, and scale-out. Cloud services are also rapidly joining other infrastructures (for example, grids, clusters, and high-performance computing) as viable

platforms for scientific exploration and discovery, as well as education. Thus, it's critical to understand application formulations and usage modes that are meaningful in such a hybrid infrastructure, along with fundamental conceptual and technological challenges and ways that applications can effectively utilize clouds.

This special issue explores how cloud platforms and abstractions, either by themselves or in combination with other platforms, can be effectively used to support real-world science and engineering applications. We specifically sought articles that addressed algorithmic and application formulations, programming models and systems, runtime systems and middleware, end-to-end application workflows, and experiences with real applications.

MANISH PARASHAR

Rutgers University

We received a total of 15 submissions for this special issue, of which we were only able to accept three. Prior to organizing this special issue, Manish Parashar (one of the guest editors for this special issue) had an article submission already under consideration, which underwent independent review. Under ordinary circumstances, it would have made sense to publish it as a regular article. However, in this case, his co-authored article provides a general overview of cloud computing principles, their connections to other cyberinfrastructure, and their role in supporting computational and data-enabled science and engineering. Having this general overview at our disposal affords the opportunity to present this introduction more succinctly.

Each of the three remaining articles detail novel aspects of cloud computing. For example, in “Comparing FutureGrid, Amazon EC2, and Open Science Grid for Scientific Workflows,” Gideon Juve and his colleagues explore the use of various cyberinfrastructure alternatives (computational grids and public or private clouds) to execute scientific workflows, an important class of scientific applications. This article examines the benefits and drawbacks of cloud and grid systems using a case study from the astronomy/astrophysics domain and compares and contrasts the available infrastructures in terms of setup, usability, cost, resource availability, and performance.

Next, Dilip Kumar Krishnappa and his colleagues discuss CloudCast, an application that provides clients with personalized short-term weather forecasts based on their current location using cloud services, in “CloudCast: Cloud Computing for Short-term Weather Forecasts.” CloudCast is often implemented using traditional supercomputing, and generates accurate forecasts (using Amazon EC2) tens of minutes in the future for small areas. The authors examine the feasibility of commercial and research cloud services from a networking and computational perspective, and present exceptionally promising results.

Last, in “Cloud-Based Software Platform For Big Data Analytics in Smart Grids,” Yogesh Simmhan and his colleagues describe the use of cloud computing for smart grid applications, which incorporate pervasive sensors, actuators, and data networks into national power grids—with the focus being on a scalable software platform for the Smart Grid Cyber-Physical System using cloud technologies. The article discusses Dynamic Demand Response (D²R), a challenge application using the University of Southern California campus’s microgrid to perform intelligent

demand-side management and relieve peak load. The authors describe the use of clouds to support on-demand provisioning, massive scaling, and manageability, with the ultimate goal of being able to support the Los Angeles power grid (a much larger-scale application).

As guest editors who both have experience with traditional high-performance computing domains, we’re convinced that the confluence of traditional HPC (such as parallel supercomputers and grids) and commercial/self-hosted clouds can be a virtuous mix, and will continue to make inroads in scientific computing. The articles in this special issue help to make the case that many traditional HPC applications can truly make effective use of cloud services. At the same time, there are limitations and research challenges ahead.

With the advent of commercial cloud computing, we’ve come a long way since Bill Joy coined the phrase “the network is the computer” well over two decades ago. To borrow from the song made famous by Frank Sinatra and Count Basie, with cloud computing “the best is yet to come,” but “you ain’t seen nothing yet.” **CiSE**

George K. Thiruvathukal is a full professor in the Computer Science Department at Loyola University Chicago, where he also serves as co-director for the Center for Textual Studies and Digital Humanities. His research interests span multiple areas of computer science and interactions with science and the humanities. Thiruvathukal has a PhD in computer science from the Illinois Institute of Technology. He is the editor in chief of CiSE and an associate editor for Computing Now. Contact him at gkt@cisemagazine.org.

Manish Parashar is a professor in the Electrical and Computer Engineering Department at Rutgers University, he’s the director of the Rutgers Discovery Informatics Institute (RD12) and the US National Science Foundation (NSF) Cloud and Autonomic Computing Center (CAC) at Rutgers, and he’s the associate director of the Rutgers Center for Information Assurance. His research interests focus on applied parallel and distributed computing and computational and data-intensive science and engineering. Parashar has a PhD in computer engineering from Syracuse University. He received the IBM Faculty award twice, as well as a US NSF Career award, and he is an American Association for the Advancement of Science (AAAS) and IEEE Fellow. Contact him at parashar@rutgers.edu.
