FORMALIZED MATHEMATICS Vol. 23, No. 3, Pages 177–187, 2015 DOI: 10.1515/forma-2015-0015

Grzegorczyk's Logics. Part I

Taneli Huuskonen¹ Department of Mathematics and Statistics University of Helsinki Finland

Summary. This article is the second in a series formalizing some results in my joint work with Prof. Joanna Golińska-Pilarek ([9] and [10]) concerning a logic proposed by Prof. Andrzej Grzegorczyk ([11]).

This part presents the syntax and axioms of Grzegorczyk's *Logic of Descriptions* (LD) as originally proposed by him, as well as some theorems not depending on any semantic constructions. There are both some clear similarities and fundamental differences between LD and the non-Fregean logics introduced by Roman Suszko in [15]. In particular, we were inspired by Suszko's semantics for his non-Fregean logic SCI, presented in [16].

MSC: 03B60 03B35

Keywords: non-Fregean logic; logic of descriptions; non-classical propositional logic; equimeaning connective

MML identifier: GRZLOG_1, version: 8.1.04 5.32.1240

The notation and terminology used in this paper have been introduced in the following articles: [3], [17], [14], [2], [8], [4], [5], [1], [6], [12], [19], [21], [20], [13], [18], and [7].

1. The Construction of Grzegorczyk's LD Language

From now on k, m, n denote elements of \mathbb{N} , i, j denote natural numbers, a, b, c denote objects, X, Y, Z denote sets, D, D_1 , D_2 denote non empty sets, and p, q, r, s denote finite sequences.

The functor VAR yielding a finite sequence-membered set is defined by the term

(Def. 1) the set of all $\langle 0, k \rangle$ where k is an element of N.

Note that VAR is non empty and antichain-like.

A variable is an element of VAR. The functors: 'not', &, and '=' yielding finite sequences are defined by terms

(Def. 2) $\langle 1 \rangle$,

(Def. 3) $\langle 2 \rangle$,

(Def. 4) $\langle 3 \rangle$,

respectively. The functor GRZ-ops yielding a non empty, finite sequence-membered set is defined by the term

(Def. 5) $\{' \text{not}', \&, '='\}.$

Let us note that the functor GRZ-ops yields a Polish language. The functor GRZ-symbols yielding a non empty, finite sequence-membered set is defined by the term

(Def. 6) $VAR \cup GRZ$ -ops.

The functors: 'not', &, and '=' yield elements of GRZ-symbols. Now we state the proposition:

- (1) (i) $' \operatorname{not}' \neq \&$, and
 - (ii) 'not' \neq '=', and
 - (iii) $\& \neq '='$.

Observe that GRZ-symbols is non trivial and antichain-like.

The functor GRZ-op-arity yielding a function from GRZ-ops into $\mathbb N$ is defined by

(Def. 7) it('not') = 1 and it(&) = 2 and it('=') = 2.

The functor GRZ-arity yielding a Polish arity-function of GRZ-symbols is defined by

(Def. 8) for every a such that $a \in \text{GRZ-symbols}$ holds if $a \in \text{GRZ-ops}$, then it(a) = GRZ-op-arity(a) and if $a \notin \text{GRZ-ops}$, then it(a) = 0.

Now we state the propositions:

- (2) (i) GRZ-arity('not') = 1, and
 - (ii) GRZ-arity(&) = 2, and
 - (iii) GRZ-arity('=') = 2.
- (3) The Polish atoms (GRZ-symbols , GRZ-arity) = VAR. The theorem is a consequence of (2).

The functor GRZ-formula-set yielding a Polish language of GRZ-symbols is defined by the term

(Def. 9) Polish-WFF-set(GRZ-symbols, GRZ-arity).

A GRZ-formula is a Polish WFF of GRZ-symbols and GRZ-arity. One can verify that there exists a subset of GRZ-formula-set which is non empty.

Let us consider n. The functor \mathbf{x}_n yielding a GRZ-formula is defined by the term

(Def. 10) $\langle 0, n \rangle$.

From now on φ , ψ , ϑ , η denote GRZ-formulas.

Let us consider $\varphi.$ The functor $\neg\varphi$ yielding a GRZ-formula is defined by the term

(Def. 11) (Polish-unOp(GRZ-symbols, GRZ-arity, 'not'))(φ).

Let us consider $\psi.$ The functors: $\varphi\wedge\psi$ and $\varphi{=}\psi$ yielding GRZ-formulas are defined by terms

(Def. 12) (Polish-binOp(GRZ-symbols, GRZ-arity, &))(φ, ψ),

(Def. 13) (Polish-binOp(GRZ-symbols, GRZ-arity, $'='))(\varphi, \psi)$,

respectively. The functors: $\varphi \lor \psi$ and $\varphi \Rightarrow \psi$ yielding GRZ-formulas are defined by terms

- (Def. 14) $\neg(\neg \varphi \land \neg \psi),$
- (Def. 15) $\varphi = (\varphi \land \psi),$

respectively. The functor $\varphi \Leftrightarrow \psi$ yielding a GRZ-formula is defined by the term

 $(\text{Def. 16}) \quad (\varphi \Rightarrow \psi) \land (\psi \Rightarrow \varphi).$

We say that φ is atomic if and only if

(Def. 17) $\varphi \in$ the Polish atoms (GRZ-symbols, GRZ-arity).

We say that φ is negative if and only if

(Def. 18) Polish-WFF-head $\varphi = ' \text{not'}$.

We say that φ is conjunctive if and only if

(Def. 19) Polish-WFF-head $\varphi = \&$.

We say that φ is an equality if and only if

(Def. 20) Polish-WFF-head $\varphi = '='$.

Let us consider φ . Now we state the propositions:

- (4) φ is atomic if and only if $\varphi \in VAR$.
- (5) φ is negative if and only if there exists ψ such that φ = ¬ψ.
 PROOF: If φ is negative, then there exists ψ such that φ = ¬ψ by (2), [12, (80)]. □

(6) φ is conjunctive if and only if there exists ψ and there exists ϑ such that $\varphi = \psi \wedge \vartheta$.

PROOF: If φ is conjunctive, then there exists ψ and there exists ϑ such that $\varphi = \psi \land \vartheta$ by (2), [12, (82)]. \Box

(7) φ is an equality if and only if there exists ψ and there exists ϑ such that $\varphi = \psi = \vartheta$.

PROOF: If φ is an equality, then there exists ψ and there exists ϑ such that $\varphi = \psi = \vartheta$ by (2), [12, (82)]. \Box

(8) φ is atomic or negative or conjunctive or an equality. The theorem is a consequence of (3).

Let us observe that every GRZ-formula which is atomic is also non negative and every GRZ-formula which is atomic is also non conjunctive and every GRZformula which is atomic is also non equality and every GRZ-formula which is negative is also non conjunctive and every GRZ-formula which is negative is also non equality and every GRZ-formula which is conjunctive is also non equality.

2. Axioms and Rules

The functors: GRZ-axioms and LD-specific axioms yielding non empty subsets of GRZ-formula-set are defined by conditions

- (Def. 21) for every $a, a \in \text{GRZ-axioms}$ iff there exists φ and there exists ψ and there exists ϑ such that $a = \neg(\varphi \land \neg \varphi)$ or $a = (\neg \neg \varphi) = \varphi$ or $a = \varphi = (\varphi \land \varphi)$ or $a = (\varphi \land \psi) = (\psi \land \varphi)$ or $a = (\varphi \land (\psi \land \vartheta)) = ((\varphi \land \psi) \land \vartheta)$ or $a = (\varphi \land (\psi \lor \vartheta)) = (\varphi \land \psi \lor \varphi \land \vartheta)$ or $a = (\neg(\varphi \land \psi)) = (\neg\varphi \lor \neg\psi)$ or $a = (\varphi = \psi) = (\psi = \varphi)$ or $a = (\varphi = \psi) = ((\neg \varphi) = (\neg \psi)),$
- (Def. 22) for every $a, a \in \text{LD-specific axioms iff there exists } \varphi$ and there exists ψ and there exists ϑ such that $a = \varphi = \psi \Rightarrow (\varphi \land \vartheta) = (\psi \land \vartheta)$ or $a = \varphi = \psi \Rightarrow (\varphi \lor \vartheta) = (\psi \lor \vartheta)$ or $a = \varphi = \psi \Rightarrow (\varphi = \vartheta) = (\psi = \vartheta)$,

respectively. The functor LD-axioms yielding a non empty subset of GRZ-formula-set is defined by the term

(Def. 23) GRZ-axioms \cup LD-specific axioms.

A GRZ-rule is a relation between $2^{\text{GRZ-formula-set}}$ and GRZ-formula-set. In the sequel R, R_1, R_2 denote GRZ-rules.

Let us consider R_1 and R_2 . Note that the functor $R_1 \cup R_2$ yields a GRZ-rule. The functors: GRZ-MP, GRZ-ConjIntro, GRZ-ConjElimL, and GRZ-ConjElimR yielding GRZ-rules are defined by terms

(Def. 24) the set of all $\langle \{\varphi, \varphi = \psi \}, \psi \rangle$ where φ is a GRZ-formula, ψ is a GRZ-formula,

- (Def. 25) the set of all $\langle \{\varphi, \psi\}, \varphi \land \psi \rangle$ where φ is a GRZ-formula, ψ is a GRZ-formula,
- (Def. 26) the set of all $\langle \{\varphi \land \psi\}, \varphi \rangle$ where φ is a GRZ-formula, ψ is a GRZ-formula,
- (Def. 27) the set of all $\langle \{\varphi \land \psi\}, \psi \rangle$ where φ is a GRZ-formula, ψ is a GRZ-formula, respectively. The functor GRZ-rules yielding a GRZ-rule is defined by
- (Def. 28) for every $a, a \in it$ iff $a \in \text{GRZ-MP}$ or $a \in \text{GRZ-ConjIntro}$ or $a \in \text{GRZ-ConjElimL}$ or $a \in \text{GRZ-ConjElimR}$.

A GRZ-formula sequence is a finite sequence of elements of GRZ-formula-set. A finite GRZ-formula set is a finite subset of GRZ-formula-set. From now on Γ , Γ_1 , Γ_2 denote non empty subsets of GRZ-formula-set, Δ , Δ_1 , Δ_2 denote subsets of GRZ-formula-set, P, P_1 , P_2 denote GRZ-formula sequences, and Σ , Σ_1 , Σ_2 denote finite GRZ-formula sets.

Let us consider Σ_1 and Σ_2 . Observe that the functor $\Sigma_1 \cup \Sigma_2$ yields a finite GRZ-formula set. Let us consider Γ , R, P, and n. We say that (P, n) is a correct step w.r.t. Γ , R if and only if

(Def. 29) $P(n) \in \Gamma$ or there exists a finite GRZ-formula set Q such that $\langle Q, P(n) \rangle \in R$ and for every q such that $q \in Q$ there exists k such that $k \in \text{dom } P$ and k < n and P(k) = q.

We say that P is (Γ, R) -correct if and only if

(Def. 30) for every k such that $k \in \text{dom } P$ holds (P, k) is a correct step w.r.t. Γ , R. Let a be an element of Γ . One can verify that the functor $\langle a \rangle$ yields a GRZ-formula sequence. Now we state the proposition:

(9) Let us consider an element a of Γ . Then $\langle a \rangle$ is (Γ, R) -correct.

Let us consider Γ and R. Note that there exists a GRZ-formula sequence which is non empty and (Γ, R) -correct.

Let us consider Σ . We say that Σ is (Γ, R) -correct if and only if

(Def. 31) there exists P such that $\Sigma = \operatorname{rng} P$ and P is (Γ, R) -correct.

Now we state the propositions:

- (10) If P is (Γ, R) -correct and $P = P_1 \cap P_2$, then P_1 is (Γ, R) -correct.
- (11) If P_1 is (Γ, R) -correct and P_2 is (Γ, R) -correct, then $P_1 \cap P_2$ is (Γ, R) -correct.
- (12) If Σ_1 is (Γ, R) -correct and Σ_2 is (Γ, R) -correct, then $\Sigma_1 \cup \Sigma_2$ is (Γ, R) -correct. The theorem is a consequence of (11).
- (13) If $\Gamma \subseteq \Gamma_1$ and $R \subseteq R_1$ and P is (Γ, R) -correct, then P is (Γ_1, R_1) -correct. Let us consider Γ, R , and φ . We say that $\Gamma, R \vdash \varphi$ if and only if
- (Def. 32) there exists P such that $\varphi \in \operatorname{rng} P$ and P is (Γ, R) -correct.

Let us consider Δ . We say that $\Gamma, R \vdash \Delta$ if and only if

(Def. 33) for every φ such that $\varphi \in \Delta$ holds $\Gamma, R \vdash \varphi$.

Let us consider Γ , R, and φ . Now we state the propositions:

- (14) $\Gamma, R \vdash \varphi$ if and only if there exists Σ such that $\varphi \in \Sigma$ and Σ is (Γ, R) -correct.
- (15) If $\varphi \in \Gamma$, then $\Gamma, R \vdash \varphi$. The theorem is a consequence of (9). Now we state the propositions:
- (16) If Γ, R ⊢ Σ, then there exists Σ₁ such that Σ ⊆ Σ₁ and Σ₁ is (Γ, R)-correct.
 PROOF: Define X[set] ≡ there exists Σ₁ such that \$₁ ⊆ Σ₁ and Σ₁ is (Γ, R)-correct. X[Ø]. For every sets x, Δ such that x ∈ Σ and Δ ⊆ Σ and X[Δ] holds X[Δ ∪ {x}]. X[Σ] from [8, Sch. 2]. □
- (17) If $\Gamma, R \vdash \Sigma$ and $\langle \Sigma, \varphi \rangle \in R$, then $\Gamma, R \vdash \varphi$. The theorem is a consequence of (16).
- (18) If $\Gamma, R \vdash \varphi$, then $\varphi \in \Gamma$ or there exists Σ such that $\langle \Sigma, \varphi \rangle \in R$ and $\Gamma, R \vdash \Sigma$.
- (19) If $\Gamma \subseteq \Gamma_1$ and $R \subseteq R_1$ and $\Gamma, R \vdash \varphi$, then $\Gamma_1, R_1 \vdash \varphi$.

Let us consider Γ , φ , and ψ . Now we state the propositions:

- (20) Γ , GRZ-rules $\vdash \varphi \land \psi$ if and only if Γ , GRZ-rules $\vdash \varphi$ and Γ , GRZ-rules $\vdash \psi$. The theorem is a consequence of (17).
- (21) Suppose Γ , GRZ-rules $\vdash \varphi$ and Γ , GRZ-rules $\vdash \varphi = \psi$. Then Γ , GRZ-rules $\vdash \psi$. The theorem is a consequence of (17).
- (22) Suppose Γ , GRZ-rules $\vdash \varphi$ and Γ , GRZ-rules $\vdash \varphi \Rightarrow \psi$. Then Γ , GRZ-rules $\vdash \psi$. The theorem is a consequence of (21) and (20).
- (23) If Γ , GRZ-rules $\vdash \varphi \land \psi$, then Γ , GRZ-rules $\vdash \psi \land \varphi$. The theorem is a consequence of (20).

Let us consider φ . We say that φ is GRZ-axiomatic if and only if

(Def. 34) $\varphi \in \text{GRZ-axioms.}$

We say that φ is GRZ-provable if and only if

(Def. 35) GRZ-axioms, GRZ-rules $\vdash \varphi$.

We say that φ is LD-axiomatic if and only if

(Def. 36) $\varphi \in \text{LD-axioms.}$

We say that φ is LD-provable if and only if

(Def. 37) LD-axioms, GRZ-rules $\vdash \varphi$.

Observe that $\neg(\varphi \land \neg \varphi)$ is GRZ-axiomatic and $(\neg \neg \varphi) = \varphi$ is GRZ-axiomatic and $\varphi = (\varphi \land \varphi)$ is GRZ-axiomatic.

Let us consider ψ . Observe that $(\varphi \wedge \psi) = (\psi \wedge \varphi)$ is GRZ-axiomatic and $(\neg(\varphi \wedge \psi)) = (\neg \varphi \vee \neg \psi)$ is GRZ-axiomatic and $(\varphi = \psi) = (\psi = \varphi)$ is GRZ-axiomatic and $(\varphi = \psi) = ((\neg \varphi) = (\neg \psi))$ is GRZ-axiomatic.

Let us consider ϑ . Observe that $(\varphi \land (\psi \land \vartheta)) = ((\varphi \land \psi) \land \vartheta)$ is GRZ-axiomatic and $(\varphi \land (\psi \lor \vartheta)) = (\varphi \land \psi \lor \varphi \land \vartheta)$ is GRZ-axiomatic and $\varphi = \psi \Rightarrow (\varphi \land \vartheta) = (\psi \land \vartheta)$ is LD-axiomatic and $\varphi = \psi \Rightarrow (\varphi \lor \vartheta) = (\psi \lor \vartheta)$ is LD-axiomatic and $\varphi = \psi \Rightarrow (\varphi = \vartheta) = (\psi = \vartheta)$ is LD-axiomatic and every GRZ-formula which is GRZ-axiomatic is also LD-axiomatic and every GRZ-formula which is GRZ-axiomatic is also GRZ-provable and every GRZ-formula which is LD-axiomatic is also LDprovable and every GRZ-formula which is GRZ-provable is also LDprovable and every GRZ-formula which is GRZ-provable is also LD-provable and there exists a GRZ-formula which is GRZ-axiomatic, GRZ-provable, LDaxiomatic, and LD-provable.

Now we state the proposition:

(24) Suppose GRZ-axioms $\subseteq \Gamma$ and Γ , GRZ-rules $\vdash \varphi = \psi$. Then Γ , GRZ-rules $\vdash \psi = \varphi$. The theorem is a consequence of (15) and (21).

3. Provability

Let us consider φ and ψ . Now we state the propositions:

- (25) If $\varphi = \psi$ is GRZ-provable, then $\psi = \varphi$ is GRZ-provable.
- (26) If $\varphi = \psi$ is LD-provable, then $\psi = \varphi$ is LD-provable. Now we state the propositions:
- (27) If $\varphi = \psi$ is LD-provable and $\psi = \vartheta$ is LD-provable, then $\varphi = \vartheta$ is LD-provable. The theorem is a consequence of (24), (22), and (21).
- (28) $\varphi = \varphi$ is LD-provable. The theorem is a consequence of (24) and (27).

Let us consider φ and ψ . We say that $\varphi =_{LD} \psi$ if and only if

(Def. 38) $\varphi = \psi$ is LD-provable.

One can check that the predicate is reflexive and symmetric.

Now we state the proposition:

(29) If $\varphi =_{\text{LD}} \psi$, then $\neg \varphi =_{\text{LD}} \neg \psi$. The theorem is a consequence of (21).

The scheme *BinReplace* deals with a non empty set \mathcal{X} and a binary functor \mathcal{F} yielding an element of \mathcal{X} and a binary predicate \mathcal{R} and states that

(Sch. 1) For every elements a, b, c, d of \mathcal{X} such that $\mathcal{R}[a, b]$ and $\mathcal{R}[c, d]$ holds $\mathcal{R}[\mathcal{F}(a, c), \mathcal{F}(b, d)]$

provided

• for every elements a, b, c of \mathcal{X} such that $\mathcal{R}[a, b]$ and $\mathcal{R}[b, c]$ holds $\mathcal{R}[a, c]$ and

- for every elements a, b of $\mathcal{X}, \mathcal{R}[\mathcal{F}(a, b), \mathcal{F}(b, a)]$ and
- for every elements a, b, c of \mathcal{X} such that $\mathcal{R}[a, b]$ holds $\mathcal{R}[\mathcal{F}(a, c), \mathcal{F}(b, c)]$.

Let us consider φ , ψ , ϑ , and η .

Let us assume that $\varphi =_{LD} \psi$ and $\vartheta =_{LD} \eta$. Now we state the propositions:

- (30) $\varphi \wedge \vartheta =_{\mathrm{LD}} \psi \wedge \eta$. PROOF: Define $\mathcal{F}(\text{GRZ-formula}, \text{GRZ-formula}) = \$_1 \land \$_2$. Define $\mathcal{P}[\text{GRZ-formula})$ formula, GRZ-formula] \equiv \$1=\$2 is LD-provable. For every φ , ψ , and ϑ such that $\mathcal{P}[\varphi, \psi]$ and $\mathcal{P}[\psi, \vartheta]$ holds $\mathcal{P}[\varphi, \vartheta]$. For every φ, ψ, ϑ , and η such that $\mathcal{P}[\varphi,\psi]$ and $\mathcal{P}[\vartheta,\eta]$ holds $\mathcal{P}[\mathcal{F}(\varphi,\vartheta),\mathcal{F}(\psi,\eta)]$ from *BinReplace*. \Box
- (31) $\varphi = \vartheta =_{\text{LD}} \psi = \eta.$

PROOF: Define $\mathcal{F}(GRZ$ -formula, GRZ-formula) = $\$_1 = \$_2$. Define $\mathcal{P}[GRZ$ formula, GRZ-formula] \equiv $_1=$ is LD-provable. For every φ , ψ , and ϑ such that $\mathcal{P}[\varphi, \psi]$ and $\mathcal{P}[\psi, \vartheta]$ holds $\mathcal{P}[\varphi, \vartheta]$. For every φ, ψ, ϑ , and η such that $\mathcal{P}[\varphi, \psi]$ and $\mathcal{P}[\vartheta, \eta]$ holds $\mathcal{P}[\mathcal{F}(\varphi, \vartheta), \mathcal{F}(\psi, \eta)]$ from *BinReplace*. \Box

The functor LD-IdR yielding an equivalence relation of GRZ-formula-set is defined by

(Def. 39) for every φ and ψ , $\langle \varphi, \psi \rangle \in it$ iff $\varphi =_{\mathrm{LD}} \psi$.

Note that there exists a family of subsets of GRZ-formula-set which is non empty.

The functor LD-IdClasses yielding a non empty family of subsets of GRZ-formula-set is defined by the term

(Def. 40) Classes LD-IdR.

An LD-identity class is an element of LD-IdClasses. Let us consider φ . The functor LD-IdClassOf φ yielding an LD-identity class is defined by the term

(Def. 41) $[\varphi]_{\text{LD-IdR}}$.

Now we state the proposition:

(32) $\varphi =_{\text{LD}} \psi$ if and only if LD-IdClassOf $\varphi =$ LD-IdClassOf ψ . **PROOF:** If $\varphi =_{\text{LD}} \psi$, then LD-IdClassOf $\varphi =$ LD-IdClassOf ψ by [14, (18), (23)]. \Box

The scheme UnOpCongr deals with a non empty set \mathcal{X} and a unary functor \mathcal{F} yielding an element of \mathcal{X} and an equivalence relation \mathcal{E} of \mathcal{X} and states that

(Sch. 2) There exists a unary operation f on Classes \mathcal{E} such that for every element $x \text{ of } \mathcal{X}, f([x]_{\mathcal{E}}) = [\mathcal{F}(x)]_{\mathcal{E}}$

provided

• for every elements x, y of \mathcal{X} such that $\langle x, y \rangle \in \mathcal{E}$ holds $\langle \mathcal{F}(x), \mathcal{F}(y) \rangle \in \mathcal{E}$.

The scheme BinOpCongr deals with a non empty set \mathcal{X} and a binary functor \mathcal{F} yielding an element of \mathcal{X} and an equivalence relation \mathcal{E} of \mathcal{X} and states that

- (Sch. 3) There exists a binary operation f on Classes \mathcal{E} such that for every elements x, y of $\mathcal{X}, f([x]_{\mathcal{E}}, [y]_{\mathcal{E}}) = [\mathcal{F}(x, y)]_{\mathcal{E}}$ provided
 - for every elements x_1, x_2, y_1, y_2 of \mathcal{X} such that $\langle x_1, x_2 \rangle, \langle y_1, y_2 \rangle \in \mathcal{E}$ holds $\langle \mathcal{F}(x_1, y_1), \mathcal{F}(x_2, y_2) \rangle \in \mathcal{E}$.

From now on x, y, z denote LD-identity classes. Now we state the proposition:

(33) There exists φ such that $x = \text{LD-IdClassOf } \varphi$.

Let us consider x. We say that x is LD-provable if and only if

(Def. 42) there exists φ such that $x = \text{LD-IdClassOf } \varphi$ and φ is LD-provable. The functor $\neg x$ yielding an LD-identity class is defined by

- (Def. 43) there exists φ such that $x = \text{LD-IdClassOf } \varphi$ and $it = \text{LD-IdClassOf } \neg \varphi$. One can verify that the functor is involutive. Let us consider y. The functor $x \wedge y$ yielding an LD-identity class is defined by
- (Def. 44) there exists φ and there exists ψ such that $x = \text{LD-IdClassOf }\varphi$ and $y = \text{LD-IdClassOf }\psi$ and $it = \text{LD-IdClassOf}(\varphi \land \psi)$.

Note that the functor is commutative and idempotent. The functor x=y yielding an LD-identity class is defined by

(Def. 45) there exists φ and there exists ψ such that $x = \text{LD-IdClassOf }\varphi$ and $y = \text{LD-IdClassOf }\psi$ and $it = \text{LD-IdClassOf }\varphi = \psi$.

One can check that the functor is commutative.

The functor $x \lor y$ yielding an LD-identity class is defined by the term

(Def. 46)
$$\neg(\neg x \land \neg y)$$
.

Let us observe that the functor is commutative and idempotent. The functor $x \Rightarrow y$ yielding an LD-identity class is defined by the term

```
(Def. 47) x=(x \wedge y).
```

Let φ be an LD-provable GRZ-formula. Let us observe that LD-IdClassOf φ is LD-provable.

Now we state the proposition:

(34) If LD-IdClassOf φ is LD-provable, then φ is LD-provable. The theorem is a consequence of (32) and (21).

Let us consider x and y. Now we state the propositions:

- (35) $x \wedge y$ is LD-provable if and only if x is LD-provable and y is LD-provable. The theorem is a consequence of (34) and (20).
- (36) x=y is LD-provable if and only if x = y. The theorem is a consequence of (34) and (32).

Now we state the proposition:

(37) LD-IdClassOf $\neg \varphi = \neg$ LD-IdClassOf φ .

Let us consider φ and ψ . Now we state the propositions:

- (38) LD-IdClassOf($\varphi \wedge \psi$) = LD-IdClassOf $\varphi \wedge$ LD-IdClassOf ψ .
- (39) LD-IdClassOf $\varphi = \psi = (\text{LD-IdClassOf }\varphi) = (\text{LD-IdClassOf }\psi).$
- (40) LD-IdClassOf($\varphi \lor \psi$) = LD-IdClassOf $\varphi \lor$ LD-IdClassOf ψ .
- (41) LD-IdClassOf($\varphi \Rightarrow \psi$) = LD-IdClassOf $\varphi \Rightarrow$ LD-IdClassOf ψ .

Now we state the propositions:

- (42) $(x \wedge y) \wedge z = x \wedge (y \wedge z)$. The theorem is a consequence of (33) and (32).
- (43) $x \Rightarrow y$ is LD-provable if and only if $x = x \land y$.
- (44) If $x \Rightarrow y$ is LD-provable and $y \Rightarrow z$ is LD-provable, then $x \Rightarrow z$ is LD-provable. The theorem is a consequence of (36) and (42).
- (45) If $\varphi \Rightarrow \psi$ is LD-provable and $\psi \Rightarrow \vartheta$ is LD-provable, then $\varphi \Rightarrow \vartheta$ is LD-provable. The theorem is a consequence of (41), (34), and (44).

Let us consider x, y, and z. Now we state the propositions:

- (46) $x \lor (y \lor z) = (x \lor y) \lor z.$
- (47) $x \land (y \lor z) = x \land y \lor x \land z$. The theorem is a consequence of (33), (32), and (40).
- (48) $x \lor y \land z = (x \lor y) \land (x \lor z)$. The theorem is a consequence of (47). Let us consider x and y. Now we state the propositions:
- (49) $x \Rightarrow y$ is LD-provable and $y \Rightarrow x$ is LD-provable if and only if x = y. The theorem is a consequence of (36).
- (50) If x is LD-provable, then $x \lor y$ is LD-provable. The theorem is a consequence of (33), (35), (47), and (48).
