# Finite Product of Semiring of Sets 

Roland Coghetto<br>Rue de la Brasserie 5<br>7100 La Louvière, Belgium

Summary. We formalize that the image of a semiring of sets 17 by an injective function is a semiring of sets. We offer a non-trivial example of a semiring of sets in a topological space [21]. Finally, we show that the finite product of a semiring of sets is also a semiring of sets [21] and that the finite product of a classical semiring of sets [8] is a classical semiring of sets. In this case, we use here the notation from the book of Aliprantis and Border [1].

MSC: 28A05 03E02 03B35
Keywords: set partitions; semiring of sets
MML identifier: SRINGS_4, version: 8.1.04 5.32.1237

The notation and terminology used in this paper have been introduced in the following articles: [9], [2], [3], [4], [22], [7], [15], [23], [10], [11], [6], [12], [20], [26], [27], 19], [14], 16], [25], [18], and [13].

## 1. Preliminaries

From now on $X_{1}, X_{2}, X_{3}, X_{4}$ denote sets.
Now we state the propositions:
(1) (i) $X_{1} \cap X_{4} \backslash\left(X_{2} \cup X_{3}\right)$ misses $X_{1} \backslash\left(\left(X_{2} \cup X_{3}\right) \cup X_{4}\right)$, and
(ii) $X_{1} \cap X_{4} \backslash\left(X_{2} \cup X_{3}\right)$ misses $\left(X_{1} \cap X_{3}\right) \cap X_{4} \backslash X_{2}$, and
(iii) $X_{1} \backslash\left(\left(X_{2} \cup X_{3}\right) \cup X_{4}\right)$ misses $\left(X_{1} \cap X_{3}\right) \cap X_{4} \backslash X_{2}$.
(2) $\left(X_{1} \backslash X_{2}\right) \backslash\left(X_{3} \backslash X_{4}\right)=\left(X_{1} \backslash\left(X_{2} \cup X_{3}\right)\right) \cup\left(X_{1} \cap X_{4} \backslash X_{2}\right)$.
(3) $\quad\left(X_{1} \backslash\left(X_{2} \cup X_{3}\right)\right) \cup\left(X_{1} \cap X_{4} \backslash X_{2}\right)=\left(\left(X_{1} \cap X_{4} \backslash\left(X_{2} \cup X_{3}\right)\right) \cup\left(X_{1} \backslash\left(\left(X_{2} \cup\right.\right.\right.\right.$ $\left.\left.\left.\left.X_{3}\right) \cup X_{4}\right)\right)\right) \cup\left(\left(X_{1} \cap X_{3}\right) \cap X_{4} \backslash X_{2}\right)$.
(4) $\left(X_{1} \backslash X_{2}\right) \backslash\left(X_{3} \backslash X_{4}\right)=\left(\left(X_{1} \cap X_{4} \backslash\left(X_{2} \cup X_{3}\right)\right) \cup\left(X_{1} \backslash\left(\left(X_{2} \cup X_{3}\right) \cup\right.\right.\right.$ $\left.\left.\left.X_{4}\right)\right)\right) \cup\left(\left(X_{1} \cap X_{3}\right) \cap X_{4} \backslash X_{2}\right)$. The theorem is a consequence of (2) and (3).

$$
\begin{equation*}
\cup\left\{X_{1}, X_{2}, X_{3}\right\}=\left(X_{1} \cup X_{2}\right) \cup X_{3} . \tag{5}
\end{equation*}
$$

## 2. The Direct Image of a Semiring of Sets by an Injective Function

Now we state the proposition:
(6) Let us consider sets $T, S$, a function $f$ from $T$ into $S$, and a family $G$ of subsets of $T$. Then $f^{\circ} G=\left\{f^{\circ} A\right.$, where $A$ is a subset of $\left.T: A \in G\right\}$.
Let $T, S$ be sets, $f$ be a function from $T$ into $S$, and $G$ be a finite family of subsets of $T$. Let us note that $f^{\circ} G$ is finite.

Let $f$ be a function and $A$ be a countable set. Let us note that $f^{\circ} A$ is countable.

The scheme FraenkelCountable deals with a set $\mathcal{A}$ and a set $\mathcal{X}$ and a unary functor $\mathcal{F}$ yielding a set and states that
(Sch. 1) $\{\mathcal{F}(w)$, where $w$ is an element of $\mathcal{A}: w \in \mathcal{X}\}$ is countable provided

- $\mathcal{X}$ is countable.

Let $T, S$ be sets, $f$ be a function from $T$ into $S$, and $G$ be a countable family of subsets of $T$. Let us note that $f^{\circ} G$ is countable.

Let $X, Y$ be sets, $S$ be a family of subsets of $X$ with the empty element, and $f$ be a function from $X$ into $Y$. One can verify that $f^{\circ} S$ has the empty element.

Now we state the propositions:
(7) Let us consider sets $X, Y$, a function $f$ from $X$ into $Y$, and families $S_{1}, S_{2}$ of subsets of $X$. If $S_{1} \subseteq S_{2}$, then $f^{\circ} S_{1} \subseteq f^{\circ} S_{2}$. The theorem is a consequence of (6).
(8) Let us consider sets $X, Y$, a $\cap$-closed family $S$ of subsets of $X$, and a function $f$ from $X$ into $Y$. Suppose $f$ is one-to-one. Then $f^{\circ} S$ is a $\cap$-closed family of subsets of $Y$.
(9) Let us consider non empty sets $X, Y$, a $\cap_{f p}$-closed family $S$ of subsets of $X$, and a function $f$ from $X$ into $Y$. Suppose $f$ is one-to-one. Then $f^{\circ} S$ is a $\cap_{f p}$-closed family of subsets of $Y$.
(10) Let us consider non empty sets $X, Y$, a $\backslash \frac{C}{f p}$-closed family $S$ of subsets of $X$, and a function $f$ from $X$ into $Y$. Suppose $f$ is one-to-one and $f^{\circ} S$ is not empty. Then $f^{\circ} S$ is a $\backslash \frac{\subset}{f p}$-closed family of subsets of $Y$.

Proof: Reconsider $f_{1}=f^{\circ} S$ as a family of subsets of $Y . f_{1}$ is $\backslash \frac{C}{f p}$-closed by [10, (64), (87)], [11, (103)], [26, (123)].
(11) Let us consider non empty sets $X, Y$, a $\backslash_{f p}$-closed family $S$ of subsets of $X$, and a function $f$ from $X$ into $Y$. Suppose $f$ is one-to-one. Then $f^{\circ} S$ is a $\backslash_{f p}$-closed family of subsets of $Y$.
(12) Let us consider non empty sets $X, Y$, a semiring $S$ of sets of $X$, and a function $f$ from $X$ into $Y$. If $f$ is one-to-one, then $f^{\circ} S$ is a semiring of sets of $Y$.

## 3. The Set of Set Differences of All Elements of a Semiring of SETS

Now we state the proposition:
(13) Let us consider a 1-element finite sequence $X$. Suppose $X(1)$ is not empty. Then there exists a function $I$ from $X(1)$ into $\Pi X$ such that
(i) $I$ is one-to-one and onto, and
(ii) for every object $x$ such that $x \in X(1)$ holds $I(x)=\langle x\rangle$.

Let $X$ be a set. Observe that $2_{*}^{X}$ is $\cap$-closed and there exists a $\cap$-closed family of subsets of $X$ which has the empty element and there exists a $\cap$-closed family of subsets of $X$ with the empty element which is $\cup$-closed.

Let $X, Y$ be non empty sets. Let us observe that $X \Downarrow Y$ is non empty.
Now we state the proposition:
(14) Let us consider a set $X$, and a family $S$ of subsets of $X$ with the empty element. Then $S \backslash S=$ the set of all $A \backslash B$ where $A, B$ are elements of $S$.
Let $X$ be a set and $S$ be a family of subsets of $X$ with the empty element. The functor semidiff $S$ yielding a family of subsets of $X$ is defined by the term (Def. 1) $S \backslash S$.

Now we state the proposition:
(15) Let us consider a set $X$, a family $S$ of subsets of $X$ with the empty element, and an object $x$. Suppose $x \in \operatorname{semidiff} S$. Then there exist elements $A, B$ of $S$ such that $x=A \backslash B$. The theorem is a consequence of (14).
Let $X$ be a set and $S$ be a family of subsets of $X$ with the empty element. Observe that semidiff $S$ has the empty element.

Let $S$ be a $\cap$-closed, $\cup$-closed family of subsets of $X$ with the empty element. Note that semidiff $S$ is $\cap$-closed and $\backslash_{f p}$-closed.

Now we state the proposition:
(16) Let us consider a set $X$, and a $\cap$-closed, $\cup$-closed family $S$ of subsets of $X$ with the empty element. Then semidiff $S$ is a semiring of sets of $X$.

## 4. The Collection of All Locally Closed Sets $L C(X, \tau)$ of a Topological Space $(X, \tau)$

Let $T$ be a non empty topological space. The functor $\mathrm{LC}(T)$ yielding a family of subsets of $\Omega_{T}$ is defined by the term
(Def. 2) $\quad\{A \cap B$, where $A, B$ are subsets of $T: A$ is open and $B$ is closed $\}$.
Let us note that $\mathrm{LC}(T)$ is $\cap$-closed and $\backslash_{f p}$-closed and has the empty element.
(17) Let us consider a non empty topological space $T$. Then $\mathrm{LC}(T)$ is a semiring of sets of $\Omega_{T}$.

## 5. The Finite Product of Semirings of Sets

Let $n$ be a natural number. Note that there exists an $n$-element finite sequence which is non-empty.

Let $n$ be a non zero natural number and $X$ be a non-empty, $n$-element finite sequence.

A semiring family of $X$ is an $n$-element finite sequence and is defined by
(Def. 3) for every natural number $i$ such that $i \in \operatorname{Seg} n$ holds $i t(i)$ is a semiring of sets of $X(i)$.
In the sequel $n$ denotes a non zero natural number and $X$ denotes a nonempty, $n$-element finite sequence. Now we state the propositions:
(18) Let us consider a semiring family $S$ of $X$. Then $\operatorname{dom} S=\operatorname{dom} X$.
(19) Let us consider a semiring family $S$ of $X$, and a natural number $i$. If $i \in \operatorname{Seg} n$, then $\bigcup(S(i)) \subseteq X(i)$.
(20) Let us consider a function $f$, and an $n$-element finite sequence $X$. If $f \in \prod X$, then $f$ is an $n$-element finite sequence.

Let $n$ be a non zero natural number and $X$ be an $n$-element finite sequence. The functor SemiringProduct $X$ yielding a set is defined by
(Def. 4) for every object $f, f \in i t$ iff there exists a function $g$ such that $f=\Pi g$ and $g \in \Pi X$.
Now we state the propositions:
(21) Let us consider an $n$-element finite sequence $X$. Then SemiringProduct $X \subseteq 2^{(\bigcup \bigcup X)^{\text {dom } X} \text {. }}$
(22) Let us consider a semiring family $S$ of $X$. Then SemiringProduct $S$ is a family of subsets of $\Pi X$.
Proof: Reconsider $S_{1}=$ SemiringProduct $S$ as a subset of $2^{(U \bigcup S)^{\text {dom } S} \text {. }}$ $S_{1} \subseteq 2 \prod^{X}$ by [3, (9)], (18), [7, (89)], (19).
(23) Let us consider a non-empty, 1-element finite sequence $X$. Then $\Pi X=$ the set of all $\langle x\rangle$ where $x$ is an element of $X(1)$. The theorem is a consequence of (13).
One can check that $\Pi\langle\emptyset\rangle$ is empty. Now we state the propositions:
(24) Let us consider a non empty set $x$. Then $\Pi\langle x\rangle=$ the set of all $\langle y\rangle$ where $y$ is an element of $x$. The theorem is a consequence of (23).
(25) Let us consider a non-empty, 1-element finite sequence $X$, and a semiring family $S$ of $X$. Then SemiringProduct $S=$ the set of all $\Pi\langle s\rangle$ where $s$ is an element of $S(1)$. Proof: $S$ is non-empty by (18), [7, (3)]. $\Pi S=$ the set of all $\langle s\rangle$ where $s$ is an element of $S(1)$.
Let us consider sets $x, y$. Now we state the propositions:
(26) $\Pi\langle x\rangle \cap \Pi\langle y\rangle=\Pi\langle x \cap y\rangle$. The theorem is a consequence of (24).
(27) $\Pi\langle x\rangle \backslash \Pi\langle y\rangle=\Pi\langle x \backslash y\rangle$. The theorem is a consequence of (24).

Let us consider a non-empty, 1-element finite sequence $X$ and a semiring family $S$ of $X$. Now we state the propositions:
(28) the set of all $\Pi\langle s\rangle$ where $s$ is an element of $S(1)$ is a semiring of sets of the set of all $\langle x\rangle$ where $x$ is an element of $X(1)$. The theorem is a consequence of (24), (26), and (27).
(29) SemiringProduct $S$ is a semiring of sets of $\Pi X$. The theorem is a consequence of (23), (25), and (28).
(30) Let us consider sets $X_{1}, X_{2}$, a semiring $S_{1}$ of sets of $X_{1}$, and a semiring $S_{2}$ of sets of $X_{2}$. Then the set of all $s_{1} \times s_{2}$ where $s_{1}$ is an element of $S_{1}$, $s_{2}$ is an element of $S_{2}$ is a semiring of sets of $X_{1} \times X_{2}$.
(31) Let us consider a non-empty, $n$-element finite sequence $X_{3}$, a non-empty, 1-element finite sequence $X_{1}$, a semiring family $S_{3}$ of $X_{3}$, and a semiring family $S_{1}$ of $X_{1}$. Suppose SemiringProduct $S_{3}$ is a semiring of sets of $\prod X_{3}$ and SemiringProduct $S_{1}$ is a semiring of sets of $\Pi X_{1}$. Let us consider a family $S_{4}$ of subsets of $\Pi X_{3} \times \Pi X_{1}$. Suppose $S_{4}=$ the set of all $s_{1} \times$ $s_{2}$ where $s_{1}$ is an element of SemiringProduct $S_{3}, s_{2}$ is an element of SemiringProduct $S_{1}$. Then there exists a function $I$ from $\Pi X_{3} \times \Pi X_{1}$ into $\Pi\left(X_{3} \frown X_{1}\right)$ such that
(i) $I$ is one-to-one and onto, and
(ii) for every finite sequences $x, y$ such that $x \in \Pi X_{3}$ and $y \in \Pi X_{1}$ holds $I(x, y)=x^{\frown} y$, and
(iii) $I^{\circ} S_{4}=\operatorname{SemiringProduct}\left(S_{3} \frown S_{1}\right)$.

Proof: $\bigcup\left(S_{1}(1)\right) \subseteq X_{1}(1)$. Consider $I$ being a function from $\Pi X_{3} \times \prod X_{1}$ into $\prod\left(X_{3} \frown X_{1}\right)$ such that $I$ is one-to-one and $I$ is onto and for every finite
sequences $x, y$ such that $x \in \prod X_{3}$ and $y \in \Pi X_{1}$ holds $I(x, y)=x^{\wedge} y$. $I^{\circ} S_{4}=\operatorname{SemiringProduct}\left(S_{3} \sim S_{1}\right)$ by (25), (20), [7, (89)], [24, (153)]. $\square$
(32) Let us consider a non-empty, $n$-element finite sequence $X_{3}$, a non-empty, 1-element finite sequence $X_{1}$, a semiring family $S_{3}$ of $X_{3}$, and a semiring family $S_{1}$ of $X_{1}$. Suppose SemiringProduct $S_{3}$ is a semiring of sets of $\Pi X_{3}$ and SemiringProduct $S_{1}$ is a semiring of sets of $\Pi X_{1}$. Then SemiringProduct $\left(S_{3} \wedge S_{1}\right)$ is a semiring of sets of $\prod\left(X_{3} \wedge X_{1}\right)$. The theorem is a consequence of $(30),(31),(9)$, and (10).
(33) Let us consider a semiring family $S$ of $X$. Then SemiringProduct $S$ is a semiring of sets of $\Pi X$. Proof: Define $\mathcal{P}$ [non zero natural number $] \equiv$ for every non-empty, $\$_{1}$-element finite sequence $X$ for every semiring family $S$ of $X$, SemiringProduct $S$ is a semiring of sets of $\Pi X . \mathcal{P}[1]$. For every non zero natural number $n, \mathcal{P}[n]$ from [5, Sch. 10].
Let $n$ be a non zero natural number, $X$ be a non-empty, $n$-element finite sequence, and $S$ be a semiring family of $X$. We say that $S$ is $\cap$-closed yielding if and only if
(Def. 5) for every natural number $i$ such that $i \in \operatorname{Seg} n$ holds $S(i)$ is $\cap$-closed.
Note that there exists a semiring family of $X$ which is $\cap$-closed yielding.

## 6. The Finite Product of Classical Semirings of Sets

Let $X$ be a set. Note that there exists a semiring of sets of $X$ which is $\cap$-closed.

Let us consider a non-empty, 1-element finite sequence $X$ and a $\cap$-closed yielding semiring family $S$ of $X$. Now we state the propositions:
(34) the set of all $\Pi\langle s\rangle$ where $s$ is an element of $S(1)$ is a $\cap$-closed semiring of sets of the set of all $\langle x\rangle$ where $x$ is an element of $X(1)$. The theorem is a consequence of (26) and (28).
(35) SemiringProduct $S$ is a $\cap$-closed semiring of sets of $\Pi X$. The theorem is a consequence of $(23),(25)$, and (34).
Now we state the propositions:
(36) Let us consider sets $X_{1}, X_{2}$, a $\cap$-closed semiring $S_{1}$ of sets of $X_{1}$, and a $\cap$-closed semiring $S_{2}$ of sets of $X_{2}$. Then the set of all $s_{1} \times s_{2}$ where $s_{1}$ is an element of $S_{1}, s_{2}$ is an element of $S_{2}$ is a $\cap$-closed semiring of sets of $X_{1} \times X_{2}$.
(37) Let us consider a non-empty, $n$-element finite sequence $X_{3}$, a non-empty, 1-element finite sequence $X_{1}$, a $\cap$-closed yielding semiring family $S_{3}$ of $X_{3}$, and a $\cap$-closed yielding semiring family $S_{1}$ of $X_{1}$. Suppose SemiringProduct
$S_{3}$ is a $\cap$-closed semiring of sets of $\Pi X_{3}$ and SemiringProduct $S_{1}$ is a $\cap$-closed semiring of sets of $\Pi X_{1}$. Then SemiringProduct $\left(S_{3} \frown S_{1}\right)$ is a $\cap$-closed semiring of sets of $\Pi\left(X_{3}\right.$ ค $\left.X_{1}\right)$. The theorem is a consequence of (30), (31), (36), (8), and (10).

Let us consider $n$ and $X$. Let $S$ be a $\cap$-closed yielding semiring family of $X$. One can check that SemiringProduct $S$ is $\cap$-closed.
(38) Let us consider a $\cap$-closed yielding semiring family $S$ of $X$. Then SemiringProduct $S$ is a $\cap$-closed semiring of sets of $\Pi X$.

## 7. Measurable Rectangle

Let $n$ be a non zero natural number and $X$ be a non-empty, $n$-element finite sequence.

A classical semiring family of $X$ is an $n$-element finite sequence and is defined by
(Def. 6) for every natural number $i$ such that $i \in \operatorname{Seg} n$ holds $i t(i)$ is a semi-diffclosed, $\cap$-closed family of subsets of $X(i)$ with the empty element.
Let $X$ be an $n$-element finite sequence. We introduce MeasurableRectangle $X$ as a synonym of SemiringProduct $X$. Now we state the propositions:
(39) Every classical semiring family of $X$ is a $\cap$-closed yielding semiring family of $X$.
(40) Let us consider a classical semiring family $S$ of $X$.

Then MeasurableRectangle $S$ is a semi-diff-closed, $\cap$-closed family of subsets of $\Pi X$ with the empty element. The theorem is a consequence of (39) and (33).

Acknowledgement: I would like to thank Artur Korniłowicz for suggestions.
