**Summary.** The article provides counting derangements of finite sets and counting non bijective functions. We provide a recursive formula for the number of derangements of a finite set, together with an explicit formula involving the number  $e$ . We count the number of non-one-to-one functions between to finite sets and perform a computation to give explicitly a formalization of the birthday problem. The article is an extension of [10].

MML identifier: CARDFIN2, version: 7.11.07 4.146.1112

The notation and terminology used here have been introduced in the following papers: [13], [16], [9], [1], [4], [7], [5], [6], [14], [2], [8], [3], [11], [12], [17], [18], and [15].

## 1. PRELIMINARIES

In this paper  $x$  denotes a set.

One can verify that every finite 0-sequence of  $\mathbb{Z}$  is integer-valued.

Let  $n$  be a natural number. Observe that  $n!$  is natural.

Let  $n$  be a natural number. One can check that  $n!$  is positive.

Let  $c$  be a real number. One can verify that  $\exp c$  is positive.

Let us observe that  $e$  is positive.

The following two propositions are true:

---

<sup>1</sup>This work has been partially supported by the KBN grant N519 385136.

- (1)  $\text{id}_\emptyset$  has no fixpoint.
- (2) For every real number  $c$  such that  $c < 0$  holds  $\exp c < 1$ .

## 2. ROUNDING

Let  $n$  be a real number. The functor  $\text{round } n$  yielding an integer is defined by:

(Def. 1)  $\text{round } n = \lfloor n + \frac{1}{2} \rfloor$ .

One can prove the following two propositions:

- (3) For every integer  $a$  holds  $\text{round } a = a$ .
- (4) For every integer  $a$  and for every real number  $b$  such that  $|a - b| < \frac{1}{2}$  holds  $a = \text{round } b$ .

## 3. COUNTING DERANGEMENTS

Next we state two propositions:

- (5) Let  $n$  be a natural number and  $a, b$  be real numbers. Suppose  $a < b$ . Then there exists a real number  $c$  such that  $c \in ]a, b[$  and  $\exp a = (\sum_{\alpha=0}^{\kappa} (\text{Taylor}(\text{the function } \exp, \Omega_{\mathbb{R}}, b, a))(\alpha))_{\kappa \in \mathbb{N}}(n) + \frac{\exp c \cdot (a-b)^{n+1}}{(n+1)!}$ .
- (6) For every positive natural number  $n$  and for every real number  $c$  such that  $c < 0$  holds  $|-n! \cdot \frac{\exp c \cdot (-1)^{n+1}}{(n+1)!}| < \frac{1}{2}$ .

Let  $s$  be a set. The functor  $\text{derangements } s$  is defined as follows:

(Def. 2)  $\text{derangements } s = \{f; f \text{ ranges over permutations of } s: f \text{ has no fixpoint}\}$ .

Let  $s$  be a finite set. Observe that  $\text{derangements } s$  is finite.

Next we state several propositions:

- (7) Let  $s$  be a finite set. Then  $\text{derangements } s = \{h : s \rightarrow s: h \text{ is one-to-one} \wedge \bigwedge_x (x \in s \Rightarrow h(x) \neq x)\}$ .
- (8) For every non empty finite set  $s$  there exists a real number  $c$  such that  $c \in ]-1, 0[$  and  $\overline{\overline{\text{derangements } s}} - \frac{\overline{s!}}{e} = -\overline{s!} \cdot \frac{\exp c \cdot (-1)^{\overline{s}+1}}{(\overline{s}+1)!}$ .
- (9) For every non empty finite set  $s$  holds  $|\overline{\overline{\text{derangements } s}} - \frac{\overline{s!}}{e}| < \frac{1}{2}$ .
- (10) For every non empty finite set  $s$  holds  $\overline{\overline{\text{derangements } s}} = \text{round}(\frac{\overline{s!}}{e})$ .
- (11)  $\text{derangements } \emptyset = \{\emptyset\}$ .
- (12)  $\text{derangements}\{x\} = \emptyset$ .

The function  $\text{der seq}$  from  $\mathbb{N}$  into  $\mathbb{Z}$  is defined as follows:

(Def. 3)  $(\text{der seq})(0) = 1$  and  $(\text{der seq})(1) = 0$  and for every natural number  $n$  holds  $(\text{der seq})(n+2) = (n+1) \cdot ((\text{der seq})(n) + (\text{der seq})(n+1))$ .

Let  $c$  be an integer and let  $F$  be a finite 0-sequence of  $\mathbb{Z}$ . Observe that  $cF$  is finite, integer-valued, and transfinite sequence-like.

Let  $c$  be a complex number and let  $F$  be an empty function. One can check that  $cF$  is empty.

Next we state three propositions:

- (13) For every finite 0-sequence  $F$  of  $\mathbb{Z}$  and for every integer  $c$  holds  $c \cdot \sum F = \sum((cF) \upharpoonright (\text{len } F -' 1)) + c \cdot F(\text{len } F -' 1)$ .
- (14) Let  $X, N$  be finite 0-sequences of  $\mathbb{Z}$ . Suppose  $\text{len } N = \text{len } X + 1$ . Let  $c$  be an integer. If  $N \upharpoonright \text{len } X = cX$ , then  $\sum N = c \cdot \sum X + N(\text{len } X)$ .
- (15) For every finite set  $s$  holds  $(\text{der seq})(\overline{s}) = \overline{\text{derangements } s}$ .

#### 4. COUNTING NOT-ONE-TO-ONE FUNCTIONS AND THE BIRTHDAY PROBLEM

Let  $s, t$  be sets. The functor  $\text{not-one-to-one}(s, t)$  yields a subset of  $t^s$  and is defined by:

(Def. 4)  $\text{not-one-to-one}(s, t) = \{f : s \rightarrow t : f \text{ is not one-to-one}\}$ .

Let  $s, t$  be finite sets. Observe that  $\text{not-one-to-one}(s, t)$  is finite.

The scheme *FraenkelDiff* deals with sets  $\mathcal{A}, \mathcal{B}$  and a unary predicate  $\mathcal{P}$ , and states that:

$$\{f : \mathcal{A} \rightarrow \mathcal{B} : \text{not } \mathcal{P}[f]\} = \mathcal{B}^{\mathcal{A}} \setminus \{f : \mathcal{A} \rightarrow \mathcal{B} : \mathcal{P}[f]\}$$

provided the following requirement is met:

- If  $\mathcal{B} = \emptyset$ , then  $\mathcal{A} = \emptyset$ .

We now state three propositions:

- (16) For all finite sets  $s, t$  such that  $\overline{s} \leq \overline{t}$  holds  $\overline{\text{not-one-to-one}(s, t)} = \overline{t}^{\overline{s}} - \frac{\overline{t}!}{(\overline{t} -' \overline{s})!}$ .
- (17) For every finite set  $s$  and for every non empty finite set  $t$  such that  $\overline{s} = 23$  and  $\overline{t} = 365$  holds  $2 \cdot \overline{\text{not-one-to-one}(s, t)} > \overline{t}^{\overline{s}}$ .
- (18) For all non empty finite sets  $s, t$  such that  $\overline{s} = 23$  and  $\overline{t} = 365$  holds  $P(\text{not-one-to-one}(s, t)) > \frac{1}{2}$ .
