InterTran vs SysTran: Evaluation of Two Online Machine Translation Services

Marcus Uneson

Dept. of Linguistics, Lund University

May 10, 2005

[REVISED: May 28, 2005: a few typos corrected]

Abstract

This report describes the results of some simple tests of machine translations between Swedish and German performed by (a free web version of) the InterTran¹ machine translation system from Translation Experts Limited². The system claims to offer support for 30 languages³. For a comparison, Swedish-English and German-English translations by Systran⁴ were also analysed.

The work was carried out in partial fulfillment of the GSLT course Natural Language Processing, Spring 2005⁵ (Assignment 4⁶). The report and associated files are also available on the author's web page⁷.

Background

Machine Translation research

Machine translation is one of the largest challenges possible for Computational Linguistics (as well as one of the oldest). The ever-present ambiguities on all linguistic levels and the enormous difficulties in quantifying and formalizing background knowledge and message context in both source and target language are indeed daunting. As whether they are insurmountable or not, only time will tell. Hutchins (2003) argues that after substantial improvements from the 50's to the 80's, the improvements are much less obvious in the last 20 years (disregarding details

of pure convenience, such as speed and nicer interfaces). In some cases, Hutchins argues, progress can even be questioned.

Machine Translation on and for the Web

Hutchins' article refer to state-of-the-art, or something close to it. There are niches which (at least so far) have demonstrated lesser needs. With the rise of the web, online translation services have grown popular. Such services need to be lightweight and reasonably fast. Similarly, automatized translation may be attractive for a large and fast changing commercial web site. Under such circumstances, precision will not have highest priority.

This point of view often conflicts with that of the research world, where time, memory, and processing capacity is often sacrificed for performance. Presently, there seems to be a vast space in performance between research and public systems.

The present study

Purpose

The purpose of this study was to get an idea of the current state of some freely available, web-based machine translation service involving Swedish as either source or target language. If possible, I wanted to avoid having English as the other half of the pair; the world's research in theoretical and computational linguistics are enough centered on English anyway. To this end, I chose German, which spots several interesting and challenging traits absent in English, with Swedish-English as a backup.

Method

There are several free online translation services on the web. As expected, however, very few handle Swedish when paired with something else than English. In fact, the choice of InterTran was rather forced⁸. For a comparison, I tried Systran 5.0 on Swedish – English and German – English. Both offer copy-and-paste interfaces; Systran can also translate submitted URLs.

Test data

For test data, I hand-crafted a number sentences (about 40, or 75 counting variations; see Appendices

1 <http://www.tranexp.com:2000/Translate/result.shtml>

2 <http://www.tranexp.com/>

3 It should be taken to the record that this and most other claims on behalf of InterTran are entirely unjustified; in fact, as we will see, the program seems completely useless for practical purposes.

7 <http://www.ling.lu.se/persons/Marcusu/hlt/courses/gslt-nlp.html>

8 Judging from numerous links which no longer point to actual services, but rather to companies which sell related software, it might be that many free automatic translation services have disappeared relatively recently – if out of commercial instinct of self-preservation or much needed self-criticism, I cannot tell.

A and B) to reflect particular constructions that contrast in Swedish and German. Some of the most important differences may be mentioned: Swedish has two genders, two cases, and SVO as (unmarked) word order; no verbal agreement; adjectival agreement for number, definiteness, gender in both predicative and attributive position. German, on the other hand, has three genders; four cases; SVO in main clauses but SOV in subordinate clauses; verbal agreement; adjectival agreement in attributive but not in predicative position. I also included tests of some classical, less language-specific MT problems, such as anaphora resolution, nominal compounds, proper nouns, homonyms, non-compositional semantics, and puns.

The sentences were then translated into German (with some help from a native speaker), excepting some puns and idioms.

The original Swedish sentences were then submitted to InterTran (for translation into German) and SysTran (English), and the German ones similarly (for translation into Swedish and English, respectively).

Results: InterTran

InterTran's translations are given in Appendix A. The columns are, from left to right: sentence ID; informal classification of construction; the Swedish original; the InterTran translation into German; a human translation into German; and the InterTran translation back into Swedish of that translation.

Even from a very brief inspection, it is clear that I should have picked another language pair, or another service provider, or (quite possibly) both. The translations, in both directions, are too inferior to be judged. Out of the Swedish translations, the following four sentences, albeit horribly ungrammatical, are close to making some sense.

- (8) min bror och jag har en Fahrradgeschäft.
- (10) klass kommer idag inte.
- (23b) jag skal i tre sekunder gå.
- (28) den här konstruktion er till jag okänd.

The remaining 68 sentences are incomprehensible, more in style of (5, 6):

- (5): i morgon köra med klampen i bann av oss inne om trä.
- (6): varken tenn stilla bristen jag till du den utställning!

The German equivalents are just as bad. It is clear that the test sentences miss the target by light years. Probing some more basic details reveals some amazing weaknesses (Table 1).

Jag ser dig.	Ich sehe sich.
Du ser mig.	Yous bin sehend mich.
Vi ser honom.	Wes bin sehend ihm.
Han ser oss.	Er bin sehend uns.
Ni ser henne.	Yous bin sehend ihres.
De ser den.	Sie bin sehend die.
Den ser det	Die bin sehend die.

Table 1. Illustrating InterTran's idea about Swedish-German pronominal system equivalents.

The left-hand columns have a suspiciously familiar ring of atrocious word-for-word translations from English to German (*er bin sehend uns* 'he is seeing us'). It turns out (see Table 2) that InterTran's idea about Machine Translation between language X and Y is to perform a word-for-word translation from X to English, and then another word-for-word translation from the resulting atrocity into Y. Non-English symbols (such as Swedish and German Äöä, Swedish Åå) are apparently approximated with their closest match in the English alphabet before doing any lookups.

Source	Via	Target
Alla vägar bär till Rom.	All scales bear to Roe.	Alle Waage ertragen zu Rogen.
Ich erlaube mir einen kleinen Ausflug.	self permits to me a peewees excursion.	jag tillåtelsen till jag en peewees utflykten.

Table 2. Illustrating the basic idea behind InterTran's revolutionary multilingual architecture. Note 'scales' which is a word-for-word translation of *vågar*, not of *vägar* 'roads/ways'. To some software authors, they look alike.

Given this, there is really no point in thinking about any laboriously produced test data. How can such completely useless products have a market? I understand that a company generally don't want to compete with itself by putting all the services that it wishes to sell freely available on the web; but it is not clear to me that putting a worthless service up will attract any buyers of the real thing. Maybe Intertran is better as independent product (priced from \$999) than as web service (presumably it is, the contrary would be rather scary). I don't know if it is, and after having tried the web version I certainly don't want to find out.⁹

⁹ Quoting tranexps web site, www.tranexp.com, Intertran

Can save your company huge costs of continually translating pages that you might be updating in your native language on a daily, weekly or monthly basis. Each time your company makes a change to your web pages they might have to be translated again in all the languages that your pages are displayed in.

Results: Systran

After this experience, it is only with moderate expectations I went on to the Swedish-English and German-English translations by Systran 5.0. They are given in Appendix B. The doubts were unfair, however. Systran certainly commits many mistakes; only two or three of the Swedish translations could be regarded as perfect (somewhat more for German). However, it outperforms Intertran by magnitudes, and most translations are understandable, at least partly.

The following error exposé is loosely based on Hutchins (2003). The division is rather arbitrarily made from a practical perspective motivated by the questions arising when translating between Swedish, English, and German (just like Hutchins' is for English, French, German, and Russian). The list certainly does not aim to be systematic, complete, or else to imply that all problems grouped together should be solved by one particular method.

Nominal compounds

Systran apparently does some attempts of parsing compounds, extremely important for both Swedish and German. Where no parse can be found, the original word is output. *Toalettpappershållare* (s1¹⁰) could conceivably be included in a (very) large lexicon. However, *ståthållaren* (s3) must have been parsed (successfully, but incorrect, as it happens—had it been correct, we wouldn't have known if it was found in the lexicon or not) as a compound. Note also the reasonable 'cell friend' for *cellkamrat*.

Det fanns inga toalettpappershållare i toalettpappershållarlådan.	The existed no toilet paper fasteners in toalettpappershållarlådan.
Glassförsäljarkonsortiet hade värmeböljemöte.	Glassförsäljarkonsortiet had värmeböljemöte.
Ståthållaren tilldelade fången, som var en orakad, äldre man, en cellkamrat.	The pomp retainer allocated captive, that where an unshaved, older man, a cell friend.

Proper nouns

- It will translate your web pages on-the-fly regardless of how many changes/updates have been made. This way you can keep all the different language versions of your web pages continuously updated and correct...
 - Supported languages: Albanian, Arabic, Bosnian, Brazilian Portuguese, Bulgarian, Chinese, Croatian, Czech, Danish, Dutch, English, European Portuguese, Filipino/Philippino/Tagalog, Finnish, Flemish, French, German, Greek, Hindi, Hungarian, Icelandic, Italian, Japanese, Korean, Latin, Latin American Spanish, Norwegian, Old Church Slavonic, Polish, Rumanian/Romanian, Russian, Serbian (Latin script), Serbian (Cyrillic script), Slovenian, Spanish, Swedish, Turkish, Ukrainian, Vietnamese and Welsh.
 - Price: starts at US\$ 995
- 10 Here and in the following, s1, s2 etc. refer to the first, second etc. sentence in the corresponding table of examples (usually below).

Systran has fits with proper nouns which happen to coincide with common nouns, such as *Anders* (also German 'differently') and *Sten* (also Swedish 'stone'). *Sten* is not a noun in German, however, and it is correctly identified as a proper noun in s2.

Truckförare Sten Persson har köpt ett lantställe.	Forklift driver stone Persson have bought a place in the country.
Gabelstaplerföhrer Sten Persson hat ein Ferienhaus gekauft.	Fork-lift truck driver Sten Persson bought a holiday house.
Anders hat sich um den Tisch gekümmert. Den hatten seinen Eltern bestellt.	Differently about the table worried. That its parents had arranged.

Pronouns

Translating German, Systran finds it difficult to interpret pronouns to unspecified subjects, even when animate:

Ich kann seine Handschrift nicht lesen.	I cannot read its handwriting.
Sie nahm ihr Auto aus dem Garage und brachte es zur Werkstatt.	It took its car from that to garage and brought it to the workshop.

This seems to be a major challenge, warranting a somewhat wider context analysis.

For Swedish, on the other hand, pronouns are frequently and rather surprisingly translated into article without following noun. Even more surprisingly, that is true also for formal subjects to the common but few weather verbs (s2). Both of these deficiencies seem rather easy to remedy.

Anders tog hand om bordet. Det hade hans föräldrar köpt.	Anders took hand about the table. The had his parents bought.
Anders tog hand om bordet. Det hade regnat hela dagen.	Anders took hand about the table. The had rained the whole day.

Articles

Systran can render easier instances of differing article usage fine. A typical example:

Er ist Doktor.	He is a doctor.
----------------	-----------------

Case

German has four cases, governed mainly by syntactic function, by preposition, or by verb. Systran handles at least easier constructions perfectly, including word order manipulations:

Der Hund hat mir einen Knochen gebracht.	The dog brought me a bone.
Dem Hund habe ich einen Knochen gebracht.	I brought a bone to the dog.

Word order: verb-final constructions

German word order is very different from both English and Swedish, in particular regarding verbs. In more complex clauses (and some not so complex —cf. s2), Systran has difficulties in rearranging it:

Um zur Hütte zu kommen mussten wir über ein weitgestrecktes Feld, durch einen dunklen Wald und entlang zweier schönen Wege.	Over to the hut to come we had over a far-stretched field, by a dark forest and along two beautiful way.
Lasst uns den alten Mann überfallen.	Let us the old man attack.

However, less involved constructions are dealt with fine:

Niemand wusste, dass sie schon gekommen waren.	Nobody knew that they had already come.
Ich kann seine Handschrift nicht lesen.	I cannot read its handwriting.

Agreement

Agreement in the nominal phrase is more of an issue when translating from English to Swedish or German than the other way round. Agreement between subject and verb, however, is an obvious concern also when translating into English. The translations from German are mostly good in this respect (s4 is an exception), whereas those from Swedish (s1-3) may exhibit very strange errors:

Ingen visste att de redan hade kommit.	No knew that the already had come.
Har ni köpt ny bil?	Has you bought new car?
Jag tänker på dig, drömmer om dig, längtar efter dig.	I intend on yourself, dreams about yourself, longs for after yourself.
Habt ihr ein neues Auto gekauft?	Her a new car bought?

Adverb formation

Adverb formation with -ly is a productive process in English; sometimes Systran is just to productive in using it:

Jag kommer att ha pratat klart om tre sekunder.	I have spoken clearly about three seconds.
---	--

This kind of error should be relatively easy to remedy.

Prepositions

Prepositions are particularly difficult for second language learners. When used in non-literal sense, the choice between different candidate prepositions often seem arbitrary. For MT systems, a choice must often be made between either interpreting the preposition literally; or assuming that it is governed by some lexical head, which then perhaps must be identified by an (error-prone) parse. The result may be an incorrect choice (s1, s3), or an incorrect deletion, or an incorrect insertion, or an incorrect retaining (s4), or an incorrect non-insertion (s2) of a preposition. Still, I am surprised to find that an undivided, common, typical phrases such as Swedish *stolt över*, German *stolz auf* both are rendered incorrectly (s1, s3).

Jag är stolt över dig och gläds åt dina ord.	I am proud over you and is made happy to your words.
Ich erlaube mir einen kleinen Ausflug.	I take the liberty a small trip.
Ich bin stolz auf dich und freue mich auf deine Worte.	I am proud on you and look forward to your words.
Jag har bott här i 30 år nu.	I have lived here in 30 years now.

Auxiliary verbs

Swedish and English mostly follow each other in the choice of auxiliary verbs. German typically uses *sein* rather than *haben* for building the perfect out of movement verbs. Systran catches this:

Niemand wusste, dass sie schon gekommen waren.	Nobody knew that they had already come.
--	---

Tense and voice

Tenses mostly coincide in Swedish and English. German exhibits a few deviations; in particular, it often uses the perfect as just a colloquial variation of the preterite. Systran chooses 'bought' rather than 'has bought' in s2 under "Agreement" above (and let's pretend it has done so by successful rather than unsuccessful analysis). An uncaught exception is seen below:

Ich wohne schon 30 jahre hier.	I live already 30 years here
--------------------------------	------------------------------

Systran also recognizes active and passive constructions, even though the naturalness of the word order may suffer:

Jag tillåts kanske en mindre utvikning.	I am permitted perhaps a smaller utvikning.
Mir wird vielleicht einen kleinen Ausflug erlaubt.	Perhaps one permits to me a small trip.

Complex clauses

It is very easy to confuse an MT system. Clauses with sufficiently complex structure will not be parsed correctly; if so, the system may easily lose track completely. The output will often be completely bogus:

Det med ett avlångt, gummiklätt handtag försedda verktyget upphittades på busstationen i morse.	The with an oblong, old lady dressed in handholds the provided tool found on the mischief station this morning.
---	---

Note the compound *busstationen* 'the bus station', which is interpreted as *bus-stationen* 'the mischief station' – incorrect, but again illustrating productive compound parsing.

Systran on coherent text

I also tested Systran on a short piece of coherent text – an excerpt from the novel *En kakelsättares eftermiddag* by the Swedish author Lars Gustafsson, and the human-made German translation of the same book, *Nachmittag eines Fliesenlegers*. Both texts were translated into English by Systran. The results are given in Appendix C. I won't comment the translations further here; they contain few problems which have not already been exemplified. However, in a connected text, the impression that the translation from German is superior to that from Swedish grows even stronger.

Summary

I found Systran rather impressing for German-English translation (especially in comparison to InterTran). It understands cases rather well and attempts boldly to reparse German word order. The unfortunate tendency to render animate subjects with 'it' could perhaps be attacked with WSD methods.

The Swedish system still lags behind, its performance being severely hampered by mistaking articles for pronouns and bad verbal agreement.

Short note on MT evaluation measures

There is no accepted metric for overall evaluation of MT systems. The difficulty of the task varies enormously, and it is unclear (to say the least) how one type of error should be evaluated in comparison to another. Most evaluation will end up with something like cost-efficiency, which I think should not be confused with evaluation from a scientific perspective (for instance, today's translation helps are likely to be much more cost-efficient simply because they have more intuitive user interfaces and

run on faster computers. But that shouldn't influence the objective measure of the translation quality itself).

As an example of how badly some metric would be needed, one may mention Sigurd's (2002) suggestion that the following formula be used for quantifying the benefit of Machine Translation.

$$Q = 100 - E^2$$

Q is supposedly 'quality' as a percentage; E is number of errors per 100 words (definition of error to be provided). Unfortunately, this is rather contentless (even if we could define error in some sensible way). What would a negative value of Q mean, and why is E squared and not raised to ½ or 3? In my opinion is the formula an unfortunate attempt to place the statement "10 errors or more per 100 words make a translation useless" in a pseudo-mathematical context where it does not belong. In fact, the formula hurts more than it helps – the formula-less statement does not convey any false ideas about precision.

Conclusion

It seems there are currently very few online systems offering translations between non-English languages. For Swedish, there is almost none. In this vacuum, there is apparently place for absolutely useless products such as (the web version of) InterTran, which is really too inferior to be evaluated.

By contrast, MT services between English and other languages are easier to find. The Systran system offers reasonably good translations between German and English. Swedish lags behind, but it does have a practical value.

APPENDIX C. SysTran translations of coherent text

Swedish original	Systran 5.0 Swe -> Eng	Human translation Swe -> Ger	Systran 5.0 Ger -> Eng
<p>Torsten Bergman hette en man, vithårig och tunn. Han var kakelsättare, född 1917. Och alltså den grå novembermorgon år 1982 då denna berättelse utspelas, i Uppsala, redan 65 år gammal. Han sov i en säng, som en gång varit äktenskaplig och dubbel. Nu var den ensam och med lakanen föga tvättade. Gamla tidningar och ett par tomflaskor låg utströdda litet här och var över golvet, och borta i hörnet var den nedhårade gamla svarta matta där hunden brukade sova.</p>	<p>Torsten Bergman was called a man, white hairy and thin. He each kakelsättare, born 1917. And therefore the gray November morning years 1982 then this statement initiative carcasses, in Uppsala, already 65 years old. He sov in a bed, as once been äktenskaplig and double. Now each the single-handed and with the sheets little cleaned. Old newspapers and a pair empty bottles low utströdda small here and each over the floor, and out in the corner where the nedhårade old black carpet where the dog farmed sova.</p>	<p>Torsten Bergman hiess der Mann, war weisshaarig und dünn. Fliesenleger, geboren 1917. Und also an dem grauen Novembermorgen des Jahres 1982, mit dem diese Erzählung in Uppsala beginnt, bereits 65 Jahre alt. Er schlief in einem Bett, das einst ehelich gewesen war und doppelt. Jetzt war es ein Einzelbett, mit schmutzigen Laken. Alte Zeitungen und ein paar leere Flaschen lagen hier und da auf dem Fussboden verstreut, und hinten in der Ecke ein eingehaarter alter schwarzer Teppich, auf dem gewöhnlich der Hund schlief.</p>	<p>Torsten Bergman was called the man, was weisshaarig and thin. Fliesenleger, born 1917. And thus on the grey November morning of the yearly 1982, with which this narration in Uppsala begins, already 65 years old. It slept in a bed, which had been once conjugal and doubles. Now it was a single bed, with schmutzigen sheets. Old newspapers and a few empty bottles lay here and there on the floor scattered, and in the back in the corner a in-shed old black carpet, on which usually the dog slept.</p>
<p>Dagen började på det enda sätt den kunde: Gräset redan stunget av den första frosten, hunden sedan dagar bortsprungnen, allt liv oklart, och hans eget mest. Trädgården skräpig, landskapet skevt. Villan var gammal, av en gång grönmålat trä, nu nästan gråblått och flagnande. Trötta grenar från tunga gamla äppelträd hängde hotfullt in över den ruttnande verandan. Trädgården ett nedskräpat, bökiigt monument över hans livs alla samlade arbeten. Och någon skulle kanske ha sagt: misslyckanden.</p>	<p>The day began on that only ways that could: The grass already stunget of the first frost, the dog since days bortsprungnen, all life unclear, and his own most. The garden skräpig, the landscape lopsided. The illusion each old, of once green painted wood, now almost gray blue and flaking. Tired areas from heavy former apple fallow hang threat fullily in over the rotting verandan. The garden a nedskräpat, troublesome monument over all his lives' overall works. And some willed perhaps have said: the misfortune.</p>	<p>Der Tag begann auf die einzig möglich Art: das Gras schon vom ersten Frost gebissen, der Hund seit Tagen entlaufen, jegliches Leben unklar, und am meisten sein eigenes. Der Garten verwildert, die Landschaft schief. Das Einfamilienhaus war alt, aus früher einmal grün gestrichenem Holz, jetzt fast graublau, mit abblätternder Farbe. Müde Äste von schweren alten Apfelbäumen neigten sich bedrohlich über die morsche Veranda. Der Garten war ein wüstes, unordentliches Monument von Torsten Bergmans gesammelten Arbeiten. Und, wie jemand vielleicht gesagt hätte: seiner Misserfolge.</p>	<p>The day began kind on those only possible: the grass already of the first frost bite, which runs away from dog for days, any life unclearly, and at most its own. The garden verwildert, the landscape inclined. The single family house was old, from in former times once green painted wood, now nearly grey blue, with peeling color. Tired branches of heavy old apple trees leaned threateningly over the rotten Veranda. The garden was a wild, untidy Monument of Torsten Bergmans collected work. And, as someone would have said maybe: its failures.</p>
