# Livscyklusvurdering

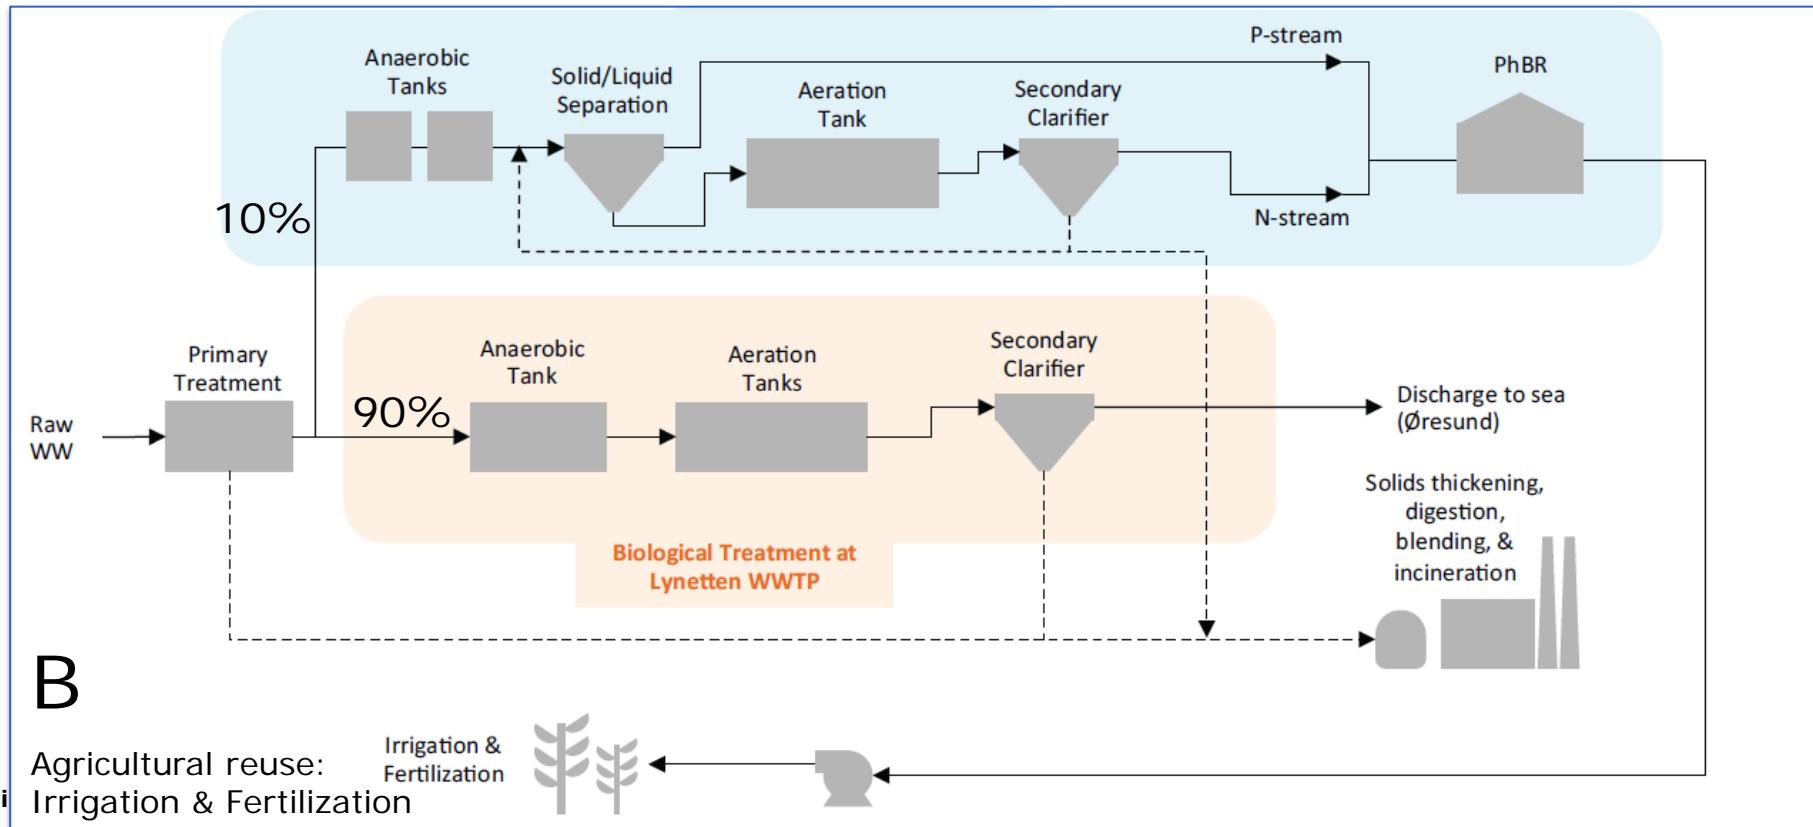

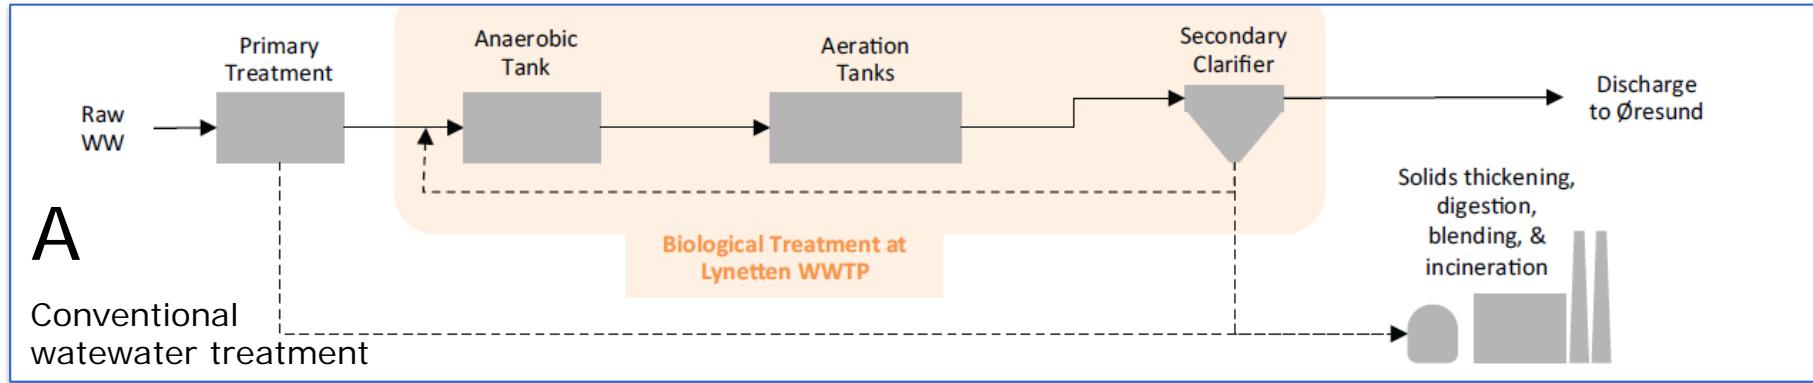

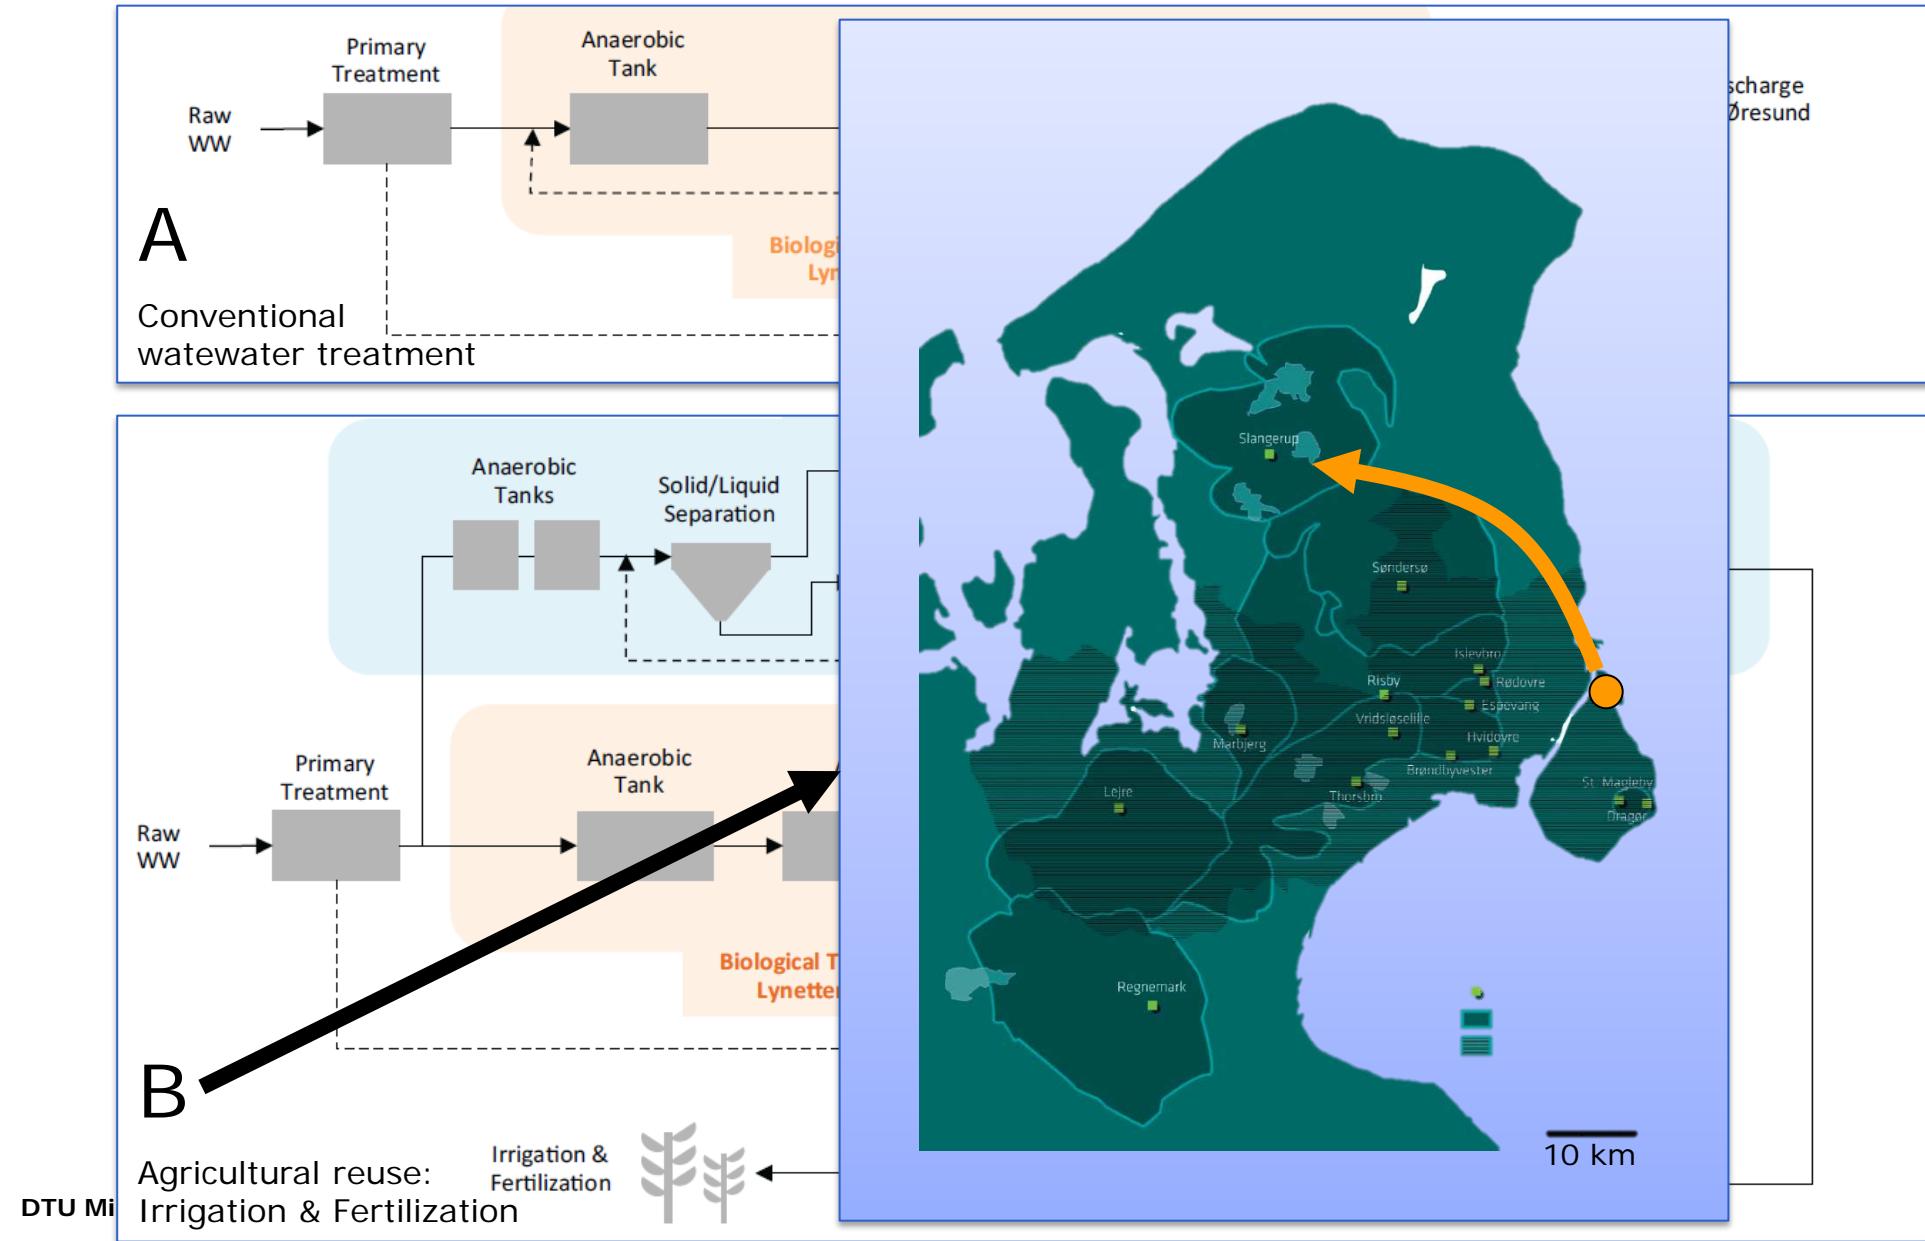

# Værdiskabelse – Value Added

$$VA \text{ (kr/år)} = \sum_{i=1}^n (Q_{ind} \cdot EP_{ind} - (Q_{ud} \cdot EP_{ud} + \AAO))$$

= *virksomhedskapital + lønninger + investeringer*

# Fra renseanlæg til ressourceanlæg: TRENs

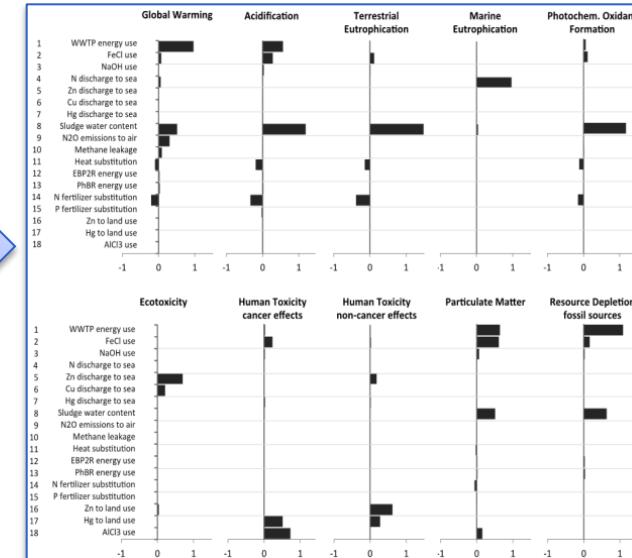

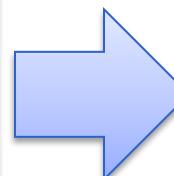

## Væsentligste beskeder til TRENS-udviklerne

- TRENS kan medføre ca 10-15% reduktion af miljøpåvirkningen i forhold til konventionel spildevandsbehandling
- Reduktionen næringsstofbelastning er meget afhængig af kontrolleret frigivelse af kvælstof fra algerne
- Tungmetallernes skæbne i TRENS er ukendt men vigtig for den samlede miljøpåvirkning
- Produktionen af lattergas  $N_2O$  i fotobioreaktoren bør undersøges nærmere
- Materialevalg bør overvejes nu

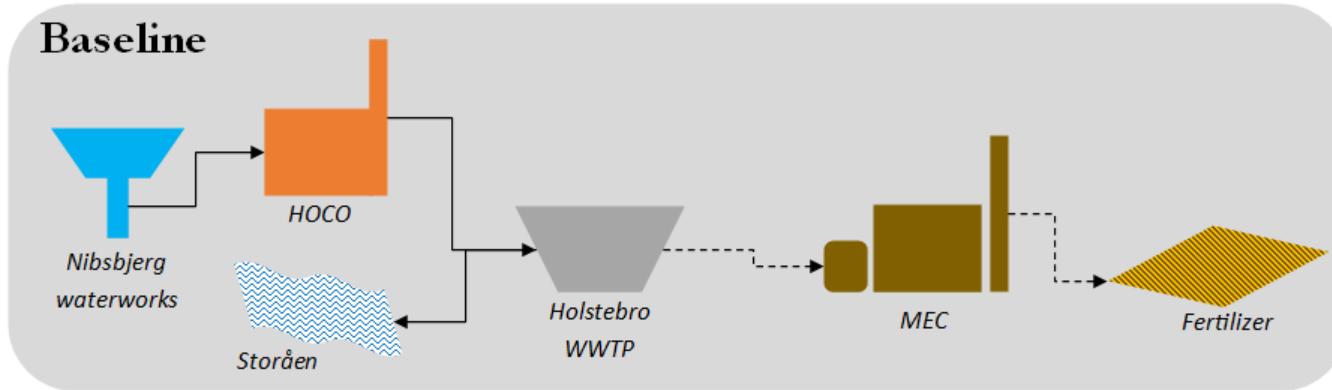

| Processes               | Parameters                          | Description   |
|-------------------------|-------------------------------------|---|
| WWTP Operation          | 1 WWTP energy use                   | Energy use in WWTP in kWh/m <sup>3</sup> influent                       |
|                         | 2 FeCl <sub>2</sub> use             | Iron (III) chloride production, for WWTP operation                      |
|                         | 3 NaOH use                          | Sodium hypochlorite production, for WWTP operation                      |
| Discharge to sea        | 4 N discharge to sea                | Amount of nitrate-nitrogen discharged from WWTP effluent                |
|                         | 5 Zn discharge to sea               | Amount of zinc discharged from WWTP effluent                            |
|                         | 6 Cu discharge to sea               | Amount of copper discharged from WWTP effluent                          |
|                         | 7 Hg discharge to sea               | Amount of mercury discharged from WWTP effluent                         |
| Sludge Incineration     | 8 Sludge water content              | Water content in dewatered sludge sent to incineration                  |
| Emissions to air        | 9 N <sub>2</sub> O emissions to air | Emission of N <sub>2</sub> O from nitrification/denitrification process |
| Biogas collection       | 10 Methane leakage                  | Leakage of methane from biogas collection system                        |
| Biogas combustion       | 11 Heat substitution                | Export to district heating from biogas combustion process               |
| TRENS (EBP2R + PBR)     | 12 EBP2R energy use                 | Energy use in EBP2R   |
| Fertilizer substitution | 13 PhBR energy use                  | Energy use in PBR   |
| Use-on-land             | 14 N fertilizer substitution        | Nitrogen substitution percentage of organic fertilizer                  |
| Pre-inf treatment       | 15 P fertilizer substitution        | Phosphorus substitution percentage of organic fertilizer                |
|                         | 16 Zn to land use                   | Amount of zinc going to agricultural soil                               |
|                         | 17 Hg to land use                   | Amount of mercury going to agricultural soil                            |
|                         | 18 AlCl <sub>3</sub> use            | Flocculant production, for pre-treatment before aquifer recharge        |

# Livscyklusvurdering af lokal vandgenindvinding på mejeri

# Værdiskabelse – Mejeri vs system

## Værdiskabelse [DKK/ton råmælk]

|                                | Vand-forsyning | Mejeri | Renseanlæg | Biogasanlæg | Total        |
|--------------------------------|----------------|--------|------------|-------------|--------------|
| <b>Forskel BAU og GBB-GENB</b> | -4,25          | 12,17  | -13,85     | -0,46       | <b>-6,38</b> |

# Tag med

1. Flere drivkræfter skubber på udviklingen af byens vandsystemer
2. Større aktører vil påvirke af op- og nedstrøms forsyninger
3. Vi udvikler værktøjer, der kan beregne effekterne for hele systemet
