2017 Small Satellite Conference

Operating Small Sat Swarms as a Single Entity: Introducing SODA

August 8, 2017

Tracie Conn PhD, Laura Plice, Andres Dono Perez & Michael Ho
Mission Design Division
NASA Ames Research Center

Motivation

- Future space physics and Earth science investigations demand simultaneous measurements from a 3D volume of space.
- There is significant opportunity for distributed, autonomous small satellite mission concepts to provide new capabilities in observing space weather.
- However, current mission operations for planning and commanding individual satellites do not scale to systems of many cooperating satellites functioning as a swarm.

Committee on Achieving Science Goals with CubeSats; Space Studies Board; Division on Engineering and Physical Sciences; National Academies of Sciences, Engineering, and Medicine, 2016, Committee Chair: Thomas Zurbuchen

SODA: Swarm Orbital Dynamics Advisor

- To address the challenge of scalable control of a distributed spacecraft swarm mission, we introduce SODA.
- SODA will prescribe maneuvers, enabling swarm autonomy:
 - Input: high-level operator commands
 - Output: Δv for each individual satellite
- Currently, SODA is a design and simulation tool for swarm missions.
 - SODA shines a light on many aspects of swarm design that differ from traditional missions: con ops, spacecraft capabilities, inter-sat communication and cooperation, deployment strategies, etc.
- Ultimately, SODA will be expanded into flight operations.

National Aeronautics and
Space Administration

High Level Operations Concept

Operator issues high level commands to the swarm as a collective

SODA prescribes maneuvers for each satellite

Spacecraft execute maneuvers and swarm type is achieved

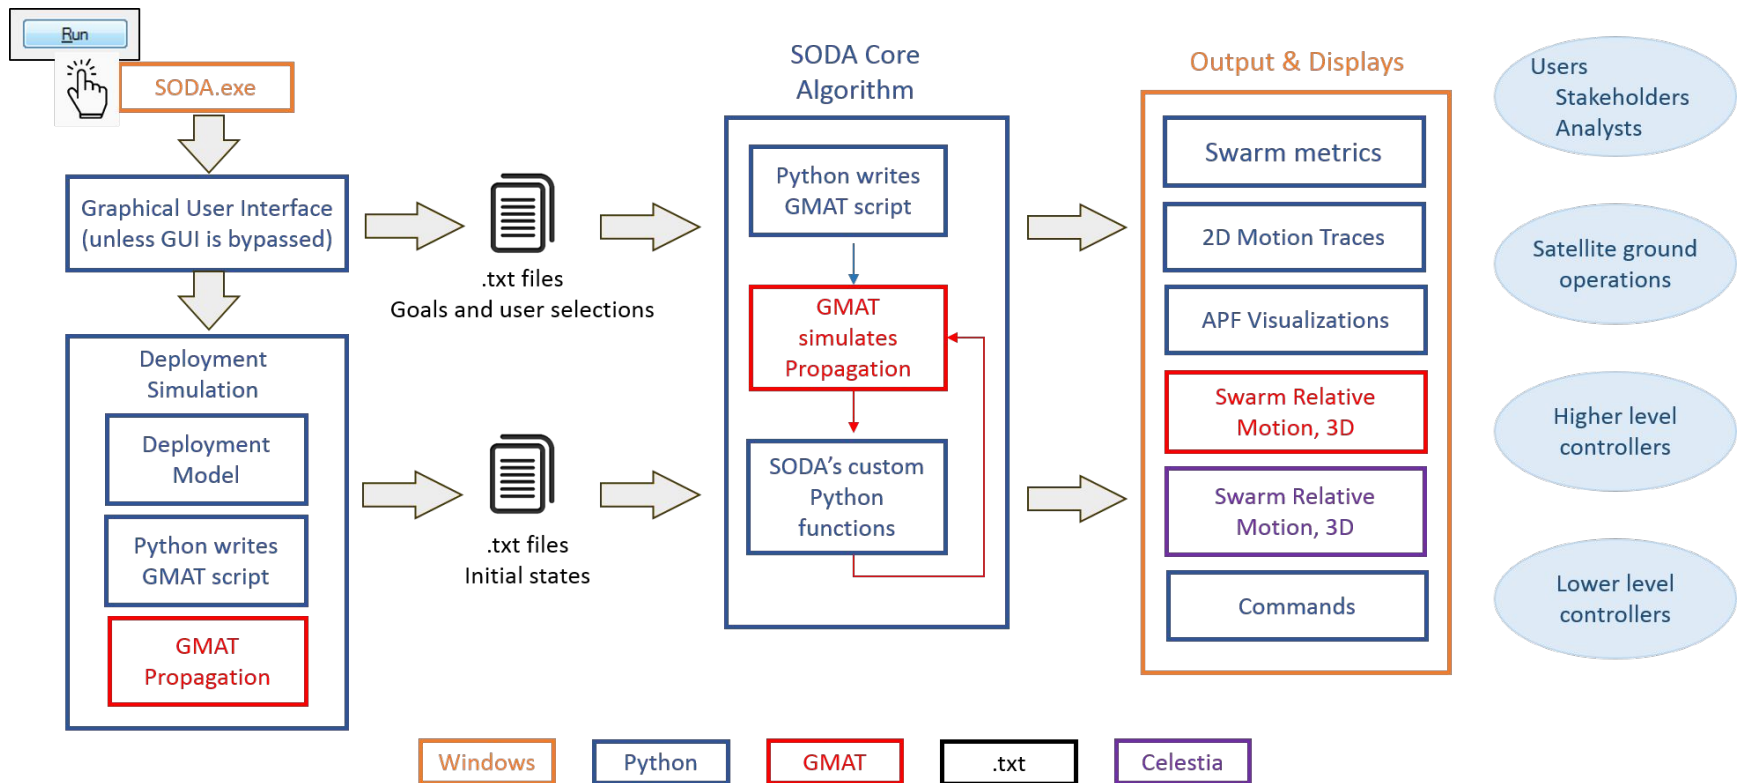

Constellation vs. Swarm

- Objective is typically ground coverage
- Satellites distributed across orbit(s)
- Examples: GPS, Galileo, GLONASS, Planet Lab's Doves, Iridium

- Multiple sats in about the same orbit
- Autonomously maintain a particular geometry, alignment, or separation
- Cross-link capability
- Cooperative system

SODA Architecture

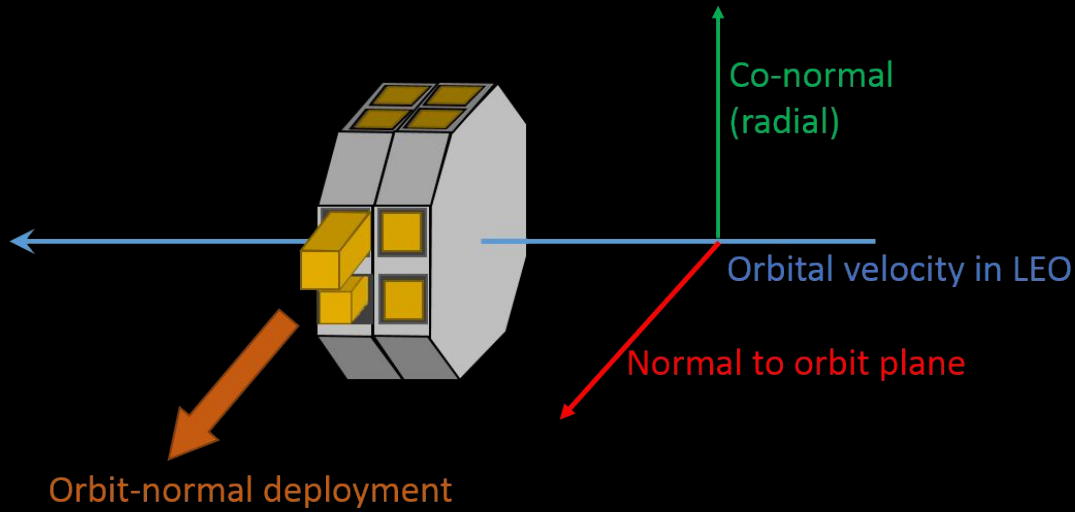

SODA GUI

The screenshot displays the SODA GUI interface, which is a software tool for configuring satellite swarm simulations. The interface is organized into several sections:

- Navigation:** A top menu bar includes "Home", "Orbital Settings", "Ellipse Dimensions", "Input Dispenser Orbit Parameters", "Spacecraft Input", and "Future Option".
- Swarm Configuration:** A "Select Swarm Type" section offers radio button options: "In Train", "Ellipsoid Container" (selected), "Ellipsoid with Distribution", "Defined geometry per phase period", "Defined geometry over duration", "Specified relative motion", and "Targeted position for satellite". A "Number of satellites" input field is set to "10".
- Global Inputs:** An "Enter Global Inputs" section contains dropdown menus for "Central Body" (set to "Earth") and "Atmospheric Model" (set to "JacchiaRoberts").
- Simulation Parameters:** Input fields for "Time Step (sec)" (set to "10") and "Simulation Duration (sec)" (set to "5000").
- Coordinate System:** A "Cartesian" section with radio buttons for "X-Component", "Y-Component", and "Z-Component".
- Navigation:** "Back" and "Next" buttons are located at the bottom of the configuration area.

Future Goals for SODA

- Additional swarm formation types
 - Motivated by science goals
- Electric, low-thrust models
- Various measurement sources (GPS, angles-only navigation, etc.)
- Prognostics models → Autonomous response to subsystem failures
- Swarm design trade space studies
- Open source
