

Spectral line shapes of collision-induced light scattering (CILS) and collision-induced absorption (CIA) using isotropic intermolecular potential for H₂-Ar

Submitted by Jean-Luc Godet on Thu, 06/22/2017 - 15:10

Titre	Spectral line shapes of collision-induced light scattering (CILS) and collision-induced absorption (CIA) using isotropic intermolecular potential for H ₂ -Ar
Type de publication	Article de revue
Auteur	El-Kader, M.S.A. [1], Godet, Jean-Luc [2], El-Sadek, A. A [3], Maroulis, George [4]
Pays	Royaume-Uni
Editeur	Taylor & Francis
Ville	Shrewsbury
Type	Article scientifique dans une revue à comité de lecture
Année	2017
Langue	Anglais
Date	19 Juin 2017
Pagination	1-12
Volume	115
Titre de la revue	Molecular Physics
ISSN	0026-8976
Mots-clés	CIA [5], CILS [6], H ₂ -Ar [7], induced dipole moment [8], intermolecular potential [9], Pair polarisability trace and anisotropy [10] Quantum mechanical line shapes of collision-induced light scattering at room temperature (295 K) and collision-induced absorption at T = 195 K are computed for gaseous mixtures of molecular hydrogen and argon using theoretical values for pair-polarisability trace and anisotropy and induced dipole moments as input. Comparison with other theoretical spectra of isotropic and anisotropic light scattering and measured spectra of absorption shows satisfactory agreement, for which the uncertainty in measurement of its spectral moments is seen to be large. Ab initio models of the trace and anisotropy polarisability which reproduce the recent spectra of scattering are given. Empirical model of the dipole moment which reproduce the experimental spectra and the first three spectral moments more closely than the fundamental theory are also given. Good agreement between computed and/or experimental line shapes of both absorption and scattering is obtained when the potential model which is constructed from the transport and thermo-physical properties is used.
Résumé en anglais	<p>Quantum mechanical line shapes of collision-induced light scattering at room temperature (295 K) and collision-induced absorption at T = 195 K are computed for gaseous mixtures of molecular hydrogen and argon using theoretical values for pair-polarisability trace and anisotropy and induced dipole moments as input. Comparison with other theoretical spectra of isotropic and anisotropic light scattering and measured spectra of absorption shows satisfactory agreement, for which the uncertainty in measurement of its spectral moments is seen to be large. Ab initio models of the trace and anisotropy polarisability which reproduce the recent spectra of scattering are given. Empirical model of the dipole moment which reproduce the experimental spectra and the first three spectral moments more closely than the fundamental theory are also given. Good agreement between computed and/or experimental line shapes of both absorption and scattering is obtained when the potential model which is constructed from the transport and thermo-physical properties is used.</p>
