Evaluation of the Laboratory Comparison Exercise for SO2, CO, O3, NO and NO2 13-16 June 2016, Ispra

Eight Laboratories of AQUILA (Network of European Air Quality Reference Laboratories) met for a laboratory comparison exercise in Ispra (IT) to evaluate their proficiency in the analysis of inorganic gaseous air pollutants (NO, NO_2, SO_2, CO and O_3). On the basis of agreed criteria, 79.3% of the results reported by AQUILA laboratories were good both in terms of measured values and reported uncertainties. The rest of the results (21.1%) had good measured values, but the reported uncertainties were either too high (17.8%) or too small (2.9%).

Abstract

Within the harmonisation programme of Air Quality monitoring in Europe the European Reference Laboratory of Air Pollution (ERLAP) is organizing Inter-Laboratory Comparison Exercises (IE). From the 13th to the 16th of June 2016, eight Laboratories of AQUILA (Network of European Air Quality Reference Laboratories) met for a laboratory comparison exercise in Ispra (IT) to evaluate their proficiency in the analysis of inorganic gaseous air pollutants (NO, NO_2, SO_2, CO and O_3) covered by the European Air Quality Directive 2008/50 EC [1] and its recent amendments 2015/1480/EC [42].

The proficiency evaluation, where each participant's bias was compared to two criteria, provides information on the current situation and capabilities to the European Commission and can be used by participants in their quality control system.

On the basis of adopted criteria, 79.3% of the results reported by AQUILA laboratories were good both in terms of measured values and reported uncertainties. The rest of the results (21.1%) had good measured values, but the reported uncertainties were either too high (17.8%) or too small (2.9%). Comparability of results among AQUILA participants at the highest generated concentration levels is satisfactory for measurements of all pollutants.

1. Introduction

The Directive 2008/50/EC [1] on ambient air quality and cleaner air for Europe sets a framework for a harmonised air quality assessment in Europe.

One important objective of the Directive [1] is that the ambient air quality shall be assessed on the basis of common methods and criteria. It deals with the air pollutants sulphur dioxide (SO_2), nitrogen dioxide (NO_2) and monoxide (NO), particulate matter, lead, benzene, carbon monoxide (CO) and ozone (O_3). Among others it specifies the reference methods for measurements and Data Quality Objectives (DQOs) for the accuracy of measurements.

The European Commission (EC) has supported the development and publication of reference measurement methods for CO [2], SO_2 [3], NO-NO_2 [4] and O_3 [5] as European standards. Appropriate calibration methods [6], [7] and [8] have been standardised by the International Organization for Standardization (ISO).

As foreseen in the Air Quality Directive, the European Reference Laboratory of Air Pollution (ERLAP) of the Directorate for Energy, Transport and Climate at the Joint Research Centre (JRC) organises inter-laboratory comparison exercises (IE) to assess and improve the status of comparability of measurements of National Reference Laboratories (NRL) of the Member States of the European Union.

The World Health Organization Collaborating Centre for Air Quality Management and Air Pollution Control, Berlin (WHO CC) is carrying out similar activities since 1994 [9] [10], [24], [31], [33], [35] and [38] but with a view to obtaining harmonised air quality data for health related studies. Their programme integrates within the WHO EURO region, which includes public health institutes and other national institutes - especially from the Central Eastern Europe, Caucasus and countries from Central Asia.

Starting in 2004, it has been decided to bring together the efforts of both the JRC-ERLAP and WHO CC and to coordinate activities as far as possible, with a view to optimize resources and have better international harmonisation.

The following report deals with the IE that took place from 13th to the 16th of June 2016 in Ispra (IT).

Since 1990 ERLAP organizes IEs aiming at evaluating the comparability of measurements carried out by NRLs and promoting information exchange among the expert laboratories. Currently, a more systematic approach has been adopted, in accordance with the Network of National Reference Laboratories for Air Quality (AQUILA) [11], aiming both at providing an alert mechanism for the purposes of the EC legislation and at supporting the implementation of quality schemes by NRLs.

The methodology for the organisation of IEs was developed by ERLAP in collaboration with AQUILA and is described in a paper on the organisation of laboratory comparison exercises for gaseous air pollutants [12].

This evaluation scheme was adopted by AQUILA in December 2008 and is applied to all IEs since then. It contains common criteria to alert the EC on possible performance failures which do not rely solely on the uncertainty claimed by participants. The evaluation scheme implements the z'-score method [13] with the uncertainty requirements for calibration gases stated in the European standards [2], [3], [4] and [5], which are consistent with the DQOs of European Directives.

According to the above mentioned document, NRLs with an overall unsatisfactory performance in the z'-score evaluation (one unsatisfactory or two questionable results per parameter) ought to repeat their participation in the following IE in order to demonstrate remediation measures [12]. In addition, considering that the evaluation scheme should be useful to participants for accreditation according to ISO 17025, they are requested to include their measurement uncertainty. Hence, participants' results

(measurement values and uncertainties) are compared to the assigned values applying the E$_n$ – score method [13].

Beside the proficiency of participating laboratories, the repeatability and reproducibility of standardised measurement methods [14], [15] and [16] are evaluated as well. These group evaluations are useful indicators of trends in measurement quality over different IEs.

2. Inter-laboratory organization

The IE was announced in February 2016 to the members of the AQUILA network and the WHO CC representative. Registration was opened in April 2016 and closed at the beginning of June 2016.
The participants were required to bring their own measurement instruments, data acquisition equipment and travelling standards (to be used for calibrations or checks during the IE).

The participants were invited to arrive on Monday, 13ᵗʰ of June 2016, for the installation of their equipment. The calibration of NO_x and O_3 analysers was carried out on Tuesday morning and the generation of NO_x and O_3 gas mixtures started at 11:00.
The calibration of SO_2 and CO analysers was carried out on Wednesday afternoon and the generation of CO and SO_2 gas mixtures started at 20:00.
The test gases generation and measurements finished on Thursday at 9:00.

2.1. Participants

All participants were organisations dealing with the routine ambient air monitoring or institutions involved in environmental or public health protection. The national representatives came from Austria, Belgium, Finland, Greece, Ireland, Poland and Spain.

Country	Laboratory	Code
Spain	Instituto De Salud Carlos III (ISCIII)	A
Belgium	Flemish Environmental Agency (VMM)	B
Poland	Chief Inspectorate of Environmental Protection (GIOS)	C
Finland	Finnish Meteorological Institute (FMI)	D
Ireland	Environmental Protection Agency (EPA)	E
Austria	Upper Austria Regional Government (OOE)	F
European Commission	European Reference Laboratory for Air Pollution (ERLAP)	G
Austria	Environment Agency Austria (EAA)	H
Greece	Ministry of Environment and Energy	I

Table 1: List of participating organizations.

Table 2 reports the manufacturer and model of the instrumentation used by every participant during the inter-laboratory comparison exercise including those used in the calculation of the assigned values.

The instrumentation used to analyse all parameters was manufactured by three different companies.
The list contains the information reported by participants and cannot be considered as an implicit or explicit endorsement by the organisers of any specific instrumentation.

2.2. Preparation of test mixtures

The ERLAP IE facility has been described in several reports [17], [18]. During this IE, gas mixtures were prepared for SO$_2$, CO, O$_3$, NO and NO$_2$ at concentration levels around limit values, critical levels and assessment thresholds set by the European Air Quality Directive [1].

The test mixtures were prepared by the dilution of gases from cylinders containing high concentrations of NO, SO$_2$ or CO using thermal mass flow controllers [8]. O$_3$ was added using an ozone generator and NO$_2$ was produced applying the gas phase titration method [19] in a condition of NO excess.

The participants were required to report three half-hour-mean measurements for each concentration level (run) in order to evaluate the repeatability of standardised measurement methods. Zero concentration levels were generated for one hour and one half-hour-mean measurement was reported. The sequence programme of generated test gases is given in Table 3.

day	start time	duration	parameter	installation	calibration	Zero Air	NO	NO$_2$	O$_3$	CO	SO$_2$
		h				nmol/mol	nmol/mol	nmol/mol	nmol/mol	mmol/mol	nmol/mol
1st	9:00	5	/	X

3. The evaluation of laboratory's measurement proficiency

To evaluate the participant's measurement proficiency, the methodology described in ISO 13528 [13] was applied. It has been agreed among the AQUILA members to take the measurement results of ERLAP as the assigned/reference values for the whole IE [12].

The traceability of ERLAP's measurement results and the method applied to validate them are presented in Annex A. In the following proficiency evaluations, the uncertainty of test gas homogeneity (Annex A) was added to the uncertainties of ERLAP's measurement results.

All data reported by participating laboratories are presented in Annex B.

As it is described in the position paper [12], the proficiency of the participants was assessed by calculating two performance indicators.

The first performance indicator (z'-score) tests whether the difference between the participants measured value and the assigned/reference value remains within the limits of a common criterion.

The second performance indicator (E_n-score) tests if the difference between the participants measured values and assigned/reference value remains within the limits of a criterion, that is calculated individually for each participant, from the uncertainty of the participants measurement result and the uncertainty of the assigned/reference value.

3.1. z' − score

The z'- score statistic is calculated according to ISO 13528 [13] as:

$$z^{'} = \frac{x_i - X}{\sqrt{\sigma_p^2 + u_X^2}} = \frac{x_i - X}{\sqrt{(a \cdot X + b)^2 + u_X^2}} \qquad \textbf{Equation 1}$$

where 'x_i' is a participant's average value for each run, 'X' is the assigned/reference value, 'σ_p' is the 'standard deviation for proficiency assessment' and 'u_X' is the standard uncertainty of the assigned value. For 'a' and 'b' see Table 4.

In the European standards [2], [3], [4] and [5] the uncertainties for calibration gases used in ongoing quality control are prescribed. In fact, it is stated that the maximum permitted expanded uncertainty for calibration gases is 5% and that 'zero gas' shall not give instrument reading higher than the detection limit. As one of the tasks of NRLs is to supply calibration gas mixtures, the 'standard deviation for proficiency assessment' (σ_p) [13] is calculated in fitness-for-purpose manner from requirements given in European standards.

Over the whole measurement range σ_p is calculated by linear interpolation between 2.5% at the calibration point (75% of calibration range) and the limit of detection at zero concentration level. The limits of detection of studied measurement methods were evaluated from the data of previous IEs. The linear function parameters of σ_p are given in Table 4:

Gas	$\sigma_p = a \cdot c + b$	
	a	b
		nmol/mol
SO$_2$	0.022	1
CO	0.024	100
O$_3$	0.020	1
NO	0.024	1
NO$_2$	0.020	1

Table 4: Standard deviation for proficiency assessment (σ_p).
σ_p is a linear function of concentration (c) with parameters: slope (a) and intercept (b).

The assessment of results in the z'-score evaluation is made according to the following criteria:
- $|z'| \leq 2$ are considered satisfactory.
- $2 < |z'| \leq 3$ are considered questionable.
- $|z'| > 3$ are considered unsatisfactory. Scores falling in this range are very unusual and are taken as evidence that an anomaly has occurred that should be investigated and corrected.

The results of z'-score evaluation are presented in bar plots (Figure 1 to Figure 5) in which the z'-scores of each participant are grouped together, and assessment criteria are presented as z'=±2 and z'=±3 lines.
Figure 1: Z'-score evaluations of SO2 measurements
Scores are given for each participant and each tested concentration level (run). Run number order (with nominal concentration) is: 0 (0 nmol/mol), 1 (60 nmol/mol), 2 (125 nmol/mol), 3 (25 nmol/mol), 4 (4 nmol/mol), 5 (12 nmol/mol). The assessment criteria are presented as z'=±2 (blue line) and z'=±3 (red line). They represent the limits for the questionable and unsatisfactory results.
Figure 2: Z'-score evaluations of CO measurements
Scores are given for each participant and each tested concentration level (run). Run number order (with nominal concentration) is: 0 (0 μmol/mol), 1 (8 μmol/mol), 2 (3.5 μmol/mol), 3 (2 μmol/mol), 4 (5 μmol/mol), 5 (0.8 μmol/mol). The assessment criteria are presented as z'=±2 (blue line) and z'=±3 (red line). They represent the limits for the questionable and unsatisfactory results.
Figure 3: Z'-score evaluations of O₃ measurements
Scores are given for each participant and each concentration level (run). Run number order (with nominal concentration) is: 0 (0 nmol/mol), 1 (125 nmol/mol), 2 (25 nmol/mol), 3 (90 nmol/mol), 4 (12 nmol/mol), 5 (60 nmol/mol). The assessment criteria are presented as z'=±2 (blue line) and z'=±3 (red line). They represent the limits for the questionable and unsatisfactory results.
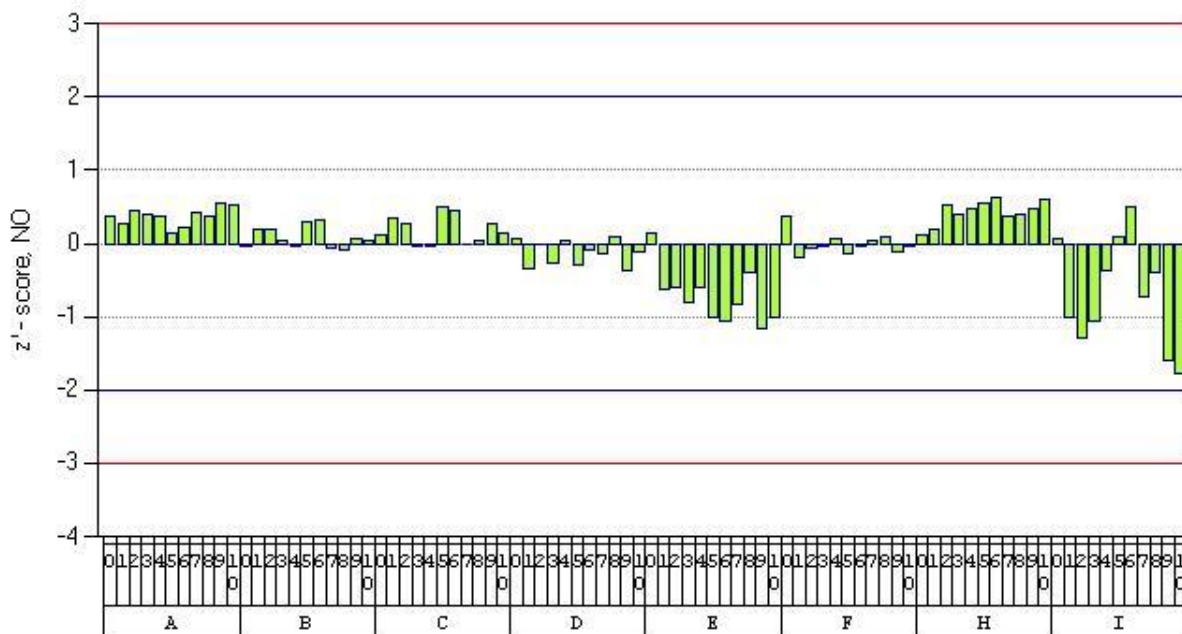

Figure 4: Z'-score evaluations of NO measurements

Scores are given for each participant and each tested concentration level (run). Run number order (with nominal concentration) is: 0 (0 nmol/mol), 1 (280 nmol/mol), 2 (160 nmol/mol), 3 (55 nmol/mol), 4 (33 nmol/mol), 5 (480 nmol/mol), 6 (390 nmol/mol), 7 (25 nmol/mol), 8 (13 nmol/mol), 9 (130 nmol/mol), 10 (70 nmol/mol). The assessment criteria are presented as z'=±2 (blue line) and z'=±3 (red line). They represent the limits for the questionable and unsatisfactory results.

Figure 5: Z'-score evaluations of NO_2 measurements

Scores are given for each participant and each concentration level (run). Run number order (with nominal concentration) is: 0 (0 nmol/mol), 1 (150 nmol/mol), 2 (110 nmol/mol), 3 (60 nmol/mol), 4 (90 nmol/mol), 5 (20 nmol/mol). The assessment criteria are presented as z'=±2 (blue line) and z'=±3 (red line). They represent the limits for the questionable and unsatisfactory results.

17

3.2. E$_n$ - score

The normalised deviations [13] (E$_n$) were calculated according to:

$$E_n = \frac{x_i - X}{\sqrt{U_{x_i}^2 + U_X^2}}$$

Equation 2

where 'X' is the assigned/reference value with an expanded uncertainty 'U$_X$' and 'x$_i$' is the participant's average value with an expanded uncertainty 'U$_{Xi}$'. Satisfactory results are the ones for which $|E_n| \leq 1$.

In Figure 6 to Figure 10 the bias of each participant (x$_i$-X) is plotted and error bars are used to show the value of denominator of equation 2 $\left(\sqrt{U_{x_i}^2 + U_X^2}\right)$. These plots represent also the E$_n$-score evaluations where, considering the E$_n$ criterion ($|E_n| \leq 1$), all results with error bars touching or crossing the x-axis are satisfactory. Reported standard uncertainties (Annex B) that are larger than the "standard deviation for proficiency assessments" (σ$_p$, Table 4) are considered not fit-for-purpose and are denoted with "*" in the x-axis of each figure. The E$_n$ evaluation showed few unsatisfactory results for different parameters and concentrations, as reported in table 5.

Parameter	Lab Code	Value	Run	En	En evaluation
SO$_2$	A	134.9	SO2 _2	1.2	unsatisfactory
CO	A	8.511	CO_1	1.1	unsatisfactory
CO	A	3.788	CO_2	1.3	unsatisfactory
CO	A	2.161	CO_3	1.1	unsatisfactory
CO	A	5.346	CO_4	1.1	unsatisfactory
CO	B	0.184	CO_0	1.4	unsatisfactory
CO	B	1.003	CO_5	1.3	unsatisfactory
CO	E	0.1	CO_0	3.3	unsatisfactory

Table 5: Unsatisfactory results according to E$_n$ - score.
Figure 6: Bias of participant's SO₂ measurement results
Expanded uncertainty of bias for each run is presented as error bar. The results with error bars touching or crossing the x-axis are satisfactory. For each evaluation the run number (numbers 0 to 5) together with the participants rounded run average (nmol/mol) is given. The '*' mark indicates reported standard uncertainties bigger than σ_p. Participant A did not report uncertainty for run number 0.
Figure 7: Bias of participant's CO measurement results

Expanded uncertainty of bias for each run is presented as error bar. Results with error bars touching or crossing the x-axis are satisfactory. For each evaluation the run number (numbers 0 to 5) together with the participants rounded run average (μmol/mol) is given. The '*' mark indicates reported standard uncertainties bigger than σ_p. Participant A did not report uncertainty for run number 0.
Figure 8: Bias of participant's O_3 measurement results
Expanded uncertainty of bias for each run is presented as error bar. Results with error bars touching or crossing the x-axis are satisfactory. For each evaluation the run number (numbers 0 to 5) together with the participants rounded run average (nmol/mol) is given. The '*' mark indicates reported standard uncertainties bigger than σ_p. Participant A did not report uncertainty for run number 0.
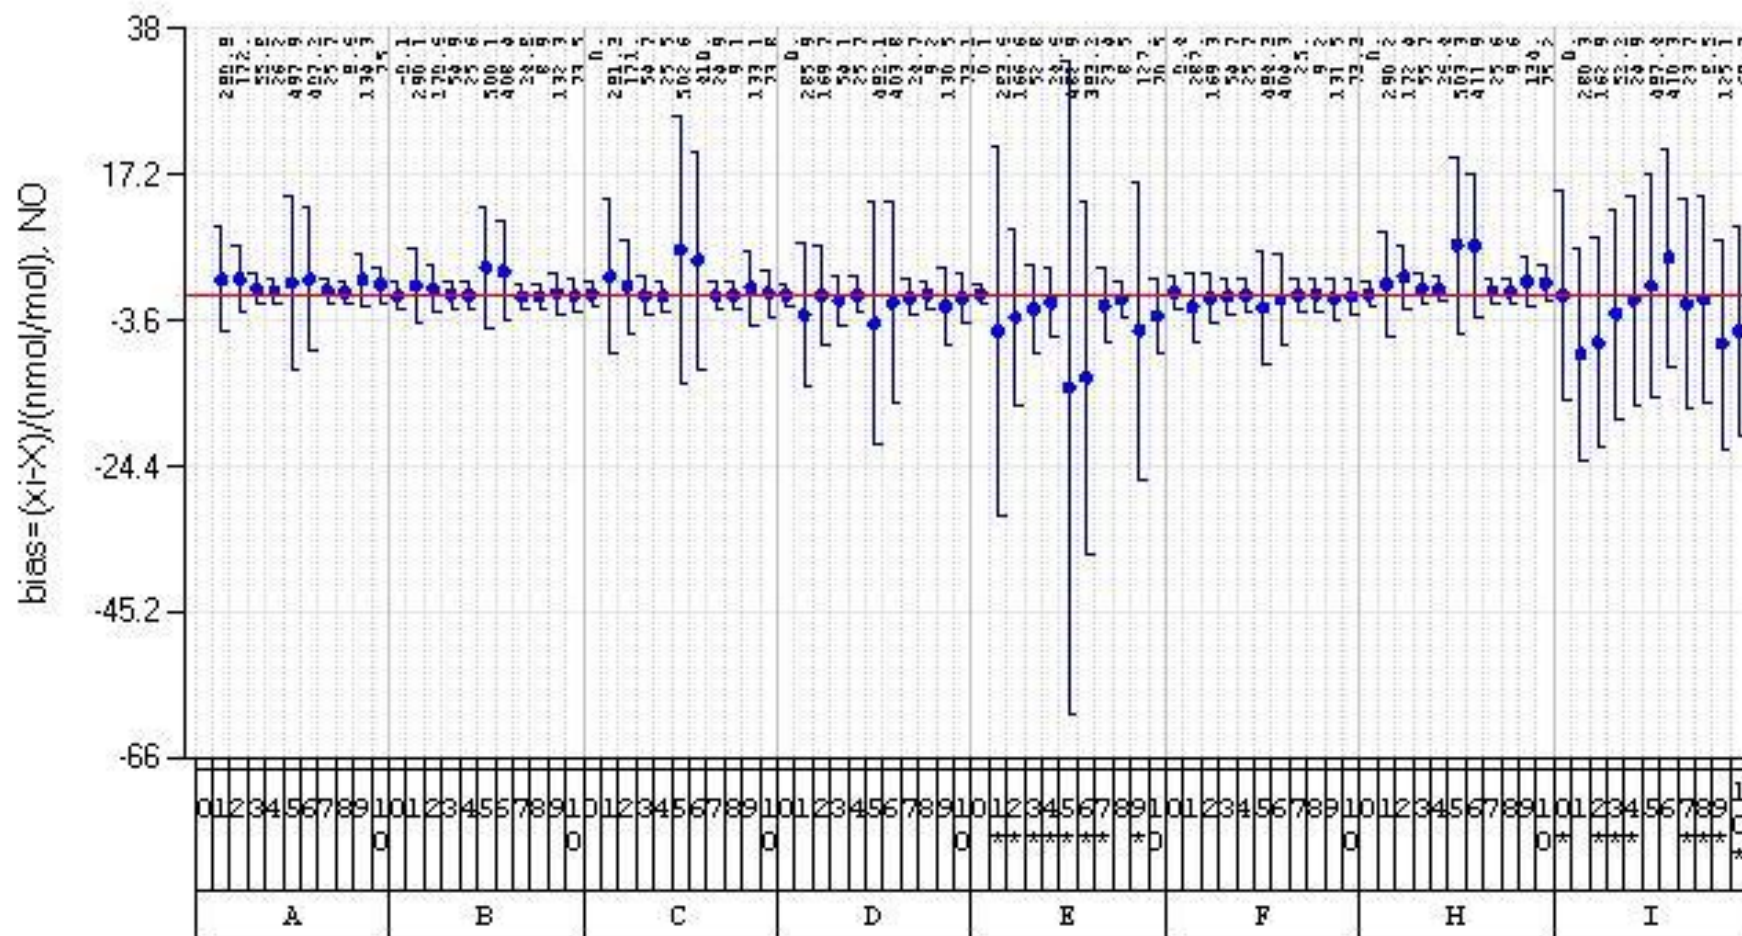

Figure 9: Bias of participant's NO measurement results
Expanded uncertainty of bias for each run is presented as error bar. Results with error bars touching or crossing the x-axis are satisfactory. For each evaluation the run number (numbers 0 to 10) together with the participants rounded run average (nmol/mol) is given. The '*' mark indicates reported standard uncertainties bigger than σ_p. Participant A did not report uncertainty for run number 0.
Figure 10: Bias of participant's NO₂ measurement results
Expanded uncertainty of bias is presented as error bar for NO₂ run numbers 0, 2, 4, 6, 8 and 10 (see Table 3). Results with error bars touching or crossing the x-axis are satisfactory. For each evaluation the run number together with the participants rounded run average (nmol/mol) is given. The '*' mark indicates reported standard uncertainties bigger than σ_p. Participant A did not report uncertainty for run number 0.

4. Performance characteristics of individual laboratories

Individual participants' biases were evaluated and are presented in chapter 3.2 (Figure 6 - 10). Since the results of NO_2 runs 1, 3, 5, 7 and 9 were not treated in proficiency evaluation the bias of these runs are presented in Figure 11.
Figure 11: Bias of participant's NO₂ measurements with error bars representing expanded uncertainty for run numbers 1, 3, 5, 7 and 9. Within these test gas mixtures there is no gas phase titration to produce NO₂ (see Table 3). For each evaluation the run number together with the participants rounded run average (nmol/mol) is given. Participant A did not express uncertainties.

4.1. Converter efficiencies of NO₂-to-NO for NOₓ analyzers

Since NO and NO_2 test gases were produced by gas phase titration it is possible to evaluate the efficiency of the NO_2-to-NO converter of each participant's NO_X analyser. The evaluation takes each participant's NO and NO_2 measurements before and after oxidation by O_3. However, possible minor instabilities in the preparation of the test gas mixtures were not taken into account. The converter efficiency (α) is calculated using Equation 3 [4]:

$$\alpha = \frac{[NO2]_i - [NO2]_{i-1}}{[NO]_{i-1} - [NO]_i} \cdot 100\% \qquad \textbf{Equation 3}$$

Ideal value for α is 100%.

The evaluation of equation 3 for each participant at different concentration levels are given in Table 6.

Lab code	NO_2 (nmol/mol)	α (%)
A	120	99.9

5. Discussion

For a general assessment of the quality of each result a decision diagram was developed (Figure 12) that results in seven categories (1 to 7). The general comments for each category are:

- ➢ **1**: measurement result is completely satisfactory
- ➢ **2**: measurement result is satisfactory (z'-score satisfactory and En-score ok) but the reported uncertainty is too high
- ➢ **3**: measured value is satisfactory (z'-score satisfactory) but the reported uncertainty is underestimated (En-score not ok)
- ➢ **4**: measurement result is questionable (z'-score questionable) but due to a high reported uncertainty can be considered valid (En-score ok)
- ➢ **5**: measurement result is questionable (z'-score questionable and En-score not ok)
- ➢ **6**: measurement result is unsatisfactory (z'-score unsatisfactory) but due to a high reported uncertainty can be considered valid (En-score ok)
- ➢ **7**: measurement result is unsatisfactory (z'-score unsatisfactory and En-score not ok)
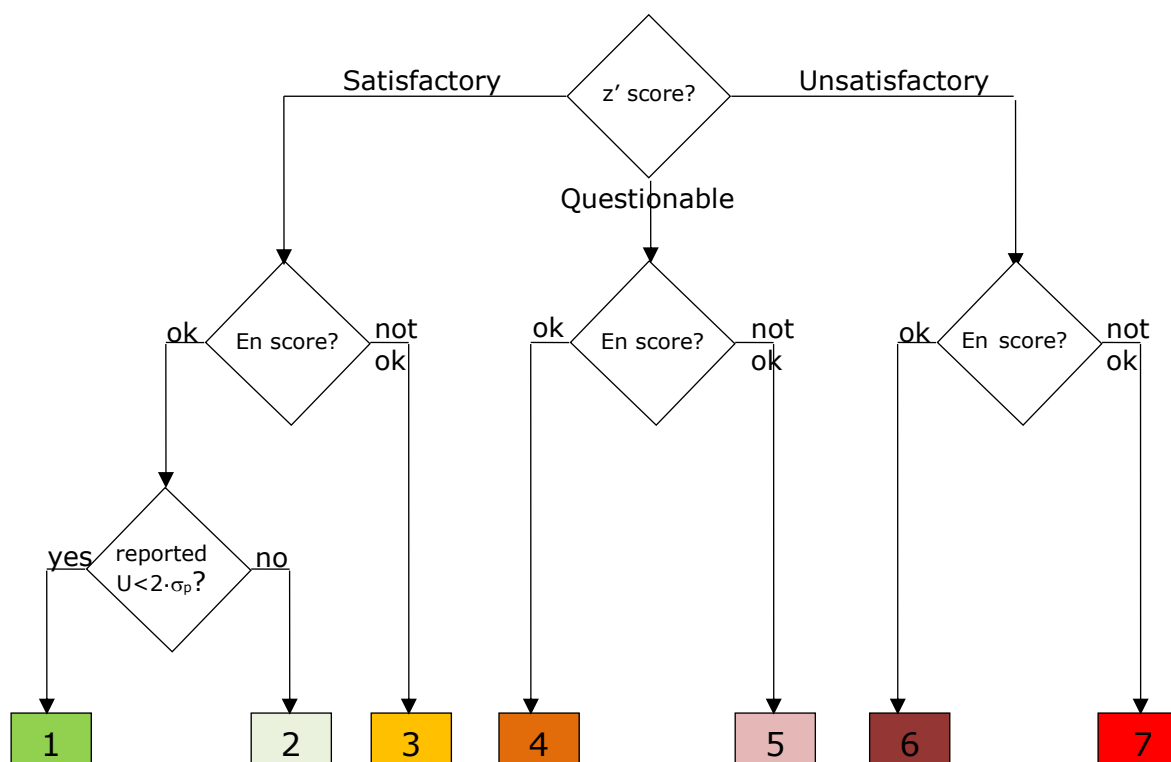

Figure 12: Decision diagram for general assessment of proficiency results.

The results of the IE were assigned to categories according to the diagram given in Figure 12 and are presented in the following Table 7.

26

"nd" is referring to values not reported

Table 7: General assessment of proficiency results.

6. Conclusions

The proficiency evaluation scheme has provided an assessment of the participants measured values and their evaluated uncertainties.

In terms of the criteria imposed by the European Directive (σ_p) 79.3% of the results reported during this IE (see Table 8) by AQUILA laboratories fall into category '1' and are satisfactory both in terms of measured values and evaluated uncertainties. Among the remaining results the majority presented satisfactory measured values, but the evaluated uncertainties were either too high, category '2' (17.8 %), or too small, category '3' (2.9%).

Table 8: Flags summary

As in previous IEs, the adopted criteria for high concentrations were the standard deviations for proficiency assessment, deriving from the European Standards' uncertainty requirements.

The reproducibility standard deviation obtained at this (Annex C) and previous IEs [20], [21], [22], [23], [24], [25], [33], [34], [35], [36], [37], [38], [39], [40], [41], [43] and [44] is comparable to the mentioned criteria. On the other hand, the uncertainty criteria for zero levels were those set in AQUILA's position paper [12].

In this exercise 100% of the results in the z'-score evaluations were satisfactory.

Table 9: Z'-score summary

Comparability of results among AQUILA participants at the highest concentration level is acceptable for all pollutant measurements.

The relative reproducibility limits, at the highest studied concentration levels, are 7.8% for SO_2, 7.9% for CO, 5.6% for O_3, for NO 4.1% and for NO_2 4.2% all within the objective derived from criteria imposed by the European Commission (σ_p see Table 4).

During this IE the performance of all NRL was generally satisfactory. Only one outlier was identified: At level 8 for NO_2 (Table 52), but without any unsatisfactory consequence for neither z'-score nor E_n-score.

Annex A. Assigned values

The assigned values of tested concentration levels (run) were derived from ERLAP's measurements which are calibrated against the certified reference values of CRMs and are traceable to international standards. In this perspective the assigned values are reference values as defined in the ISO 13528 [13].

To foster its reference function ERLAP is participating regularly to key comparisons of the Gas Analysis Working Group within the framework of BIPM's CCQM.

During this IE ERLAP's SO_2, CO and NO analysers were calibrated according to the methodology described in the ISO 6143 [6]. Reference gas mixtures were produced from the primary reference materials (produced and certified by NMi Van Swinden Laboratorium) by dynamic dilution method using mass flow controllers [8]. All flows were measured with a certified molbloc/molbox1 system. For O_3 measurements, the analysers were calibrated using the JRC SRP42 primary standard (constructed by NIST) which has been compared to BIPM primary standard [26]. The photometer absorption cross section uncertainty (1.06%) was included in the uncertainty budget [27], [28].

The reference gas mixture and the calibration experiment evaluation were carried out using two computer applications, the "GUM WORKBENCH" [29] and "B-least" [30] respectively. For extending calibration from the NO to NO_2 channel of NO_X analyser the GPT test was performed to establish the efficiency of NO_2-converter.
ERLAP's measurement results were validated by comparison to the group statistics (x* and s*) for every parameter and concentration level of the IE. These statistics are calculated from participants, applying the robust method described in the Annex C of the ISO 13528 [13]. The validation is taking into account ERLAP's measurement result (X) and its standard uncertainty (u_X) as given in Equation 4 [13]:

$$\frac{\left|x^* - X\right|}{\sqrt{\frac{\left(1{,}25 \cdot s^*\right)^2}{p} + u_X^2}} < 2 \qquad \textbf{Equation 4}$$

Where 'x*' and 's*' represent robust average and robust standard deviation respectively and 'p' is the number of participants.

Table 100 all inputs for Equation 4 are given and all ERLAP's measurement results are confirmed to be valid.

As a group evaluation robust average (x*) and robust standard deviation (s*) were calculated (applying the procedure described in Annex C of ISO 13528) for each run, and are presented in the following tables.

run	unit	X	uX'	x*	s*	p	val.

Table 10: Validation of assigned values (X)
By comparison to the robust averages (x*) with taking into account the standard uncertainties of assigned values (uX'), and robust standard deviations (s*) as denoted by Equation 4.

The homogeneity of test gas was evaluated from measurements at the beginning and end of the distribution line. From the relative differences between beginning and end

measurements, average and standard deviation were calculated, and the uncertainty of test gas due to lack of homogeneity was calculated as the sum of squares of these average and standard deviation.

$$u_{X'}^2 = u_X^2 + \left(X \cdot u_{\mathrm{hom}ogeneity} \right)^2$$ **Equation 5**

The upper and lower limits of bias due to homogeneity were evaluated to be smaller than 0.5% which constitutes the relative standard uncertainty of 0.3% of each concentration level. The standard uncertainties of assigned/reference values ($u_{X'}$) were calculated with Equation 5 and used in the proficiency evaluations of chapter 3.

Annex B. The results of the IE

In this annex are reported participant's results, presented both in tables and graphs. For all mixture concentration generated (run), participants were asked to report 3 results representing 30 minutes measurement each (x_{ij}).

In this annex are presented the reported data and their uncertainty $u(x_i)$ and $U(x_i)$ expressed in mol/mol units.

For all the runs except concentration levels 0, also average (x_i) and standard deviation (s_i) of each participant are presented.

The assigned value is indicated on the graphs with the red line and the individual laboratories expanded uncertainties (Ux_i) are indicated with error bars.

Reported values for SO₂

Annex C. The precision of standardized measurement methods

For the main purpose of monitoring trends between different IEs undertaken by ERLAP, the precision of standardized SO$_2$, CO, O$_3$ and NO$_X$ measurement methods [2], [3], [4] and [5] as implemented by NRLs, was evaluated.
Applied methodology is described in ISO 5725-1, 5725-2 and 5725-6 [14], [15] and [16]. The precision experiment has involved a total of nine laboratories, the actual number of labs (p$_j$) is reported in Table 46. Six concentration levels (for run 0 only one value is requested so repeatability cannot be evaluated) were tested for O$_3$, CO, SO$_2$ and NO$_2$, and eleven for NO. Outlier tests were performed and results are reported in Annex D.

The repeatability standard deviation (s$_r$) was calculated in accordance with ISO 5725-6 as the square root of average within-laboratory variance. The repeatability limit (r) is calculated using Equation 6 [16]. It represents the biggest difference between two test results found on an identical test gas by one laboratory using the same apparatus within the shortest feasible time interval that should not be exceeded on average more than once in 20 cases in the normal and correct operation of method.

$$r = t_{95\%,v} \cdot \sqrt{2} \cdot s_r \qquad\qquad \textbf{Equation 6}$$

The reproducibility standard deviation (s$_R$) was calculated in accordance with ISO 5725-6 as the square root of sum of repeatability and between-laboratory variance. The reproducibility limit (R) is calculated using Equation 7 [16]. It represents the biggest difference between two measurements on an identical test gas reported by two laboratories, which should not occur on average more than once in 20 cases in the normal and correct operation of method.

$$R = t_{95\%,v} \cdot \sqrt{2} \cdot s_R \qquad\qquad \textbf{Equation 7}$$

The repeatability standard deviation was evaluated with (p$_j$*(3-1)) degrees of freedom (v) and reproducibility standard deviation with (p$_j$-1) degrees of freedom. The corresponding critical range student factors (t$_{\alpha,v}$) are reported in Table 46.

parameter	run	p$_j$	t critical value 95% for r	t critical value 95% for R
CO	1,2,3,4,5	9	2.101	2.306
NO	1,2,3,4,5,6,7,8,9,10	9	2.101	2.306
NO$_2$	2,4,6,8,10	9	2.101	2.306
O$_3$	1,2,3,4,5	9	2.101	2.306
SO$_2$	1,2,3,4,5	9	2.101	2.306

Table 46: Critical values of t used in the repeatability (r) and reproducibility (R) evaluation.

The repeatability (r) and reproducibility (R) limits of measurement methods are presented from Table 477 to Table 51 and from Figure 48 to Figure 52. Also reported is the 'reproducibility from common criteria (R (from σ_p))' calculated by substituting s_R in Equation 7 with a 'standard deviation for proficiency assessment' (see Table 4). Comparison between R and R (from σ_p) serves to indicate that σ_p is realistic ([13] under 6.3.1) or from the other point of view, that the general methodology implemented by NRLs is appropriate for σ_p.

Annex D. The scrutiny of results for consistency and outlier test

The precision evaluation (Annex C) focuses on data that are as much as possible the reflection of every day work of NRLs and thus represents the comparability of participant's standard operating procedures.

For that reason, a procedure for the detection of exceptional errors (error during typing, slip in performing the measurement or the calculation, wrong averaging interval, malfunction of instrumentation, etc.) was applied. In this procedure were carried out tests for data consistency and statistical outliers as described in ISO 5725-2.

Laboratories showing some form of statistical inconsistency were requested to investigate the cause of discrepancies.

Laboratories were allowed to correct their results in case of identification of exceptional errors. Subsequently, data were considered definitive and "Grubb's one outlying observation test" was performed.

For runs where outliers were detected, outliers were removed and "Grubb's one outlying observation test" was repeated until no more outliers were observed. Statistical outliers obtained at this stage are not considered as extraordinary errors but due to significant difference in participant's standard operating procedure.

During this IE, only one statistical outlier, presented in the table below, was identified related to a NO$_2$ level:

parameter	run	laboratory	measured value	failing test	confidence level
NO$_2$	8	E	14.417	G1 minimum	1%, 5%

Table 52: "Genuine" statistical outliers according to Grubb's one outlying observation test.

The precision of standardised measurement methods reported in Annex C are calculated using the database without outliers.

According to Grubb's test, results between a confidence level of 1 and 5% are considered stragglers and they deserve a specific check.

In order to give useful information to the participants for judging their performance also the stragglers are reported in the following table:

Laboratory	parameter	run	value	Gmin_5%	Gmax_5%
B	CO	0	0.184	OK	Straggler
E	NO	6	393.217	Straggler	OK

Table 53: Stragglers according to Grubb's one observation test.

Annex E. Accreditation certificate

è conforme ai requisiti
della norma

UNI CEI EN ISO/IEC 17025:2005 "Requisiti generali per la competenza dei Laboratori di prova e taratura"

*meets the reqirements
of the standard*

EN ISO/IEC 17025:2005 "General Requirements for the Competence of Testing and Calibration Laboratories" standard

quale   **Laboratorio di Prova**

as   ***Testing Laboratory***

L'accreditamento attesta la competenza tecnica del Laboratorio relativamente allo scopo riportato nelle schede allegate al presente certificato. Le schede possono variare nel tempo. I requisiti gestionali della ISO/IEC 17025:2005 (sezione 4) sono scritti in un linguaggio idoneo all'attività dei Laboratori di Prova, sono conformi ai principi della ISO 9001:2008 ed allineati con i suoi requisiti applicabili.
Il presente certificato non è da ritenersi valido se non accompagnato dalle schede allegate e può essere sospeso o revocato in qualsiasi momento nel caso di inadempienza accertata da parte di ACCREDIA.
La vigenza dell'accreditamento può essere verificata sul sito WEB (www.accredia.it) o richiesta direttamente ai singoli Dipartimenti .

The accreditation certifies the technical competence of the laboratory limited to the scope detailed in the attached Enclosure. The scope may vary in the time. The management system requirements in ISO/IEC 17025:2005 (Section 4) are written in a language relevant to Testing Laboratories operations and meet the principles of ISO 9001:2008 and are aligned with its pertinent requirements.
The present certificate is valid only if associated to the annexed schedule, and can be suspended or withdrawn at any time in the event of non fulfilment as ascertained by ACCREDIA.
The in force status of the accreditation may be checked in the WEB site (www.accredia.it) or on direct request to appointed Department.
