General Characteristics of Casein Micelles

- ✓ 80% of the milk proteins (25 g/l)
- ✓ 94 % of 4 types of casein molecules (α_{s1}^- , α_{s2}^- , β - and κ) associated with each other through 6 % of inorganic constituents (Ca, inorganic phosphate, Mg & citrate)
- ✓ Importance in dairy technologies : source of several hundred dairy products and ingredients
- ✓ Importance in nutritional properties of dairy products
 - ✓ Vectorisation of calcium
 - ✓ Essential amino-acids
 - ✓ Peptides with biological activities

Average Characteristics of Casein Micelles

- ~ Diameter 120 nm : (range: 50–500 nm)
- ~ Surface area : $8 \times 10^{-10} \text{ cm}^2$
- ~ Volume : $2.1 \times 10^{-15} \text{ cm}^3$
- ~ Density (hydrated) : 1.0632 g cm^{-3}
- ~ Mass : $2.2 \times 10^{-15} \text{ g}$
- ~ Water content : 63 %
- ~ Hydration : $3.7 \text{ g H}_2\text{O g}^{-1} \text{ protein}$
- ~ Voluminosity : $44 \text{ cm}^3 \text{ g}^{-1}$
- ~ Molecular mass (hydrated): $1.3 \times 10^9 \text{ Da}$
- ~ Molecular mass (dehydrated) : $5 \times 10^8 \text{ Da}$
- ~ No. of peptide chains : 5×10^3
- ~ No. of particles per mL milk : $10^{14} - 10^{16}$
- ~ Surface of micelles per mL milk : $5 \times 10^4 \text{ cm}^3$
- ~ Mean free distance : 240 nm

Functionalities of Caseins

- ✓ Examples of interesting functionalities :
 - ✓ Heat stability
 - ✓ Properties of rennet and/or acid gels (capacity to the gel formation, rheological properties, syneresis, ...)
 - ✓ Properties of dehydration by spray drying and rehydration of powder
 - ✓ Nutritional and pharmaceutical properties

 - ✓ Complex properties depending on several parameters :
 - ✓ Type of protein,
 - ✓ Tridimensional structure and organisation/mineralization
 - ✓ Surface properties
 - ✓ Physico-chemical environment
-

Actual Scientific Questions Concerning Casein

- ✓ How the internal structure of casein micelle is organized ?

 - ✓ What are the role of each casein molecules in the casein micelles? (κ -casein at the surface, β -casein relatively free)

 - ✓ What is the contribution of the micellar calcium phosphate in the structure and stability of the micelles

 - ✓ Relationship between structure and functionalities of casein?
-

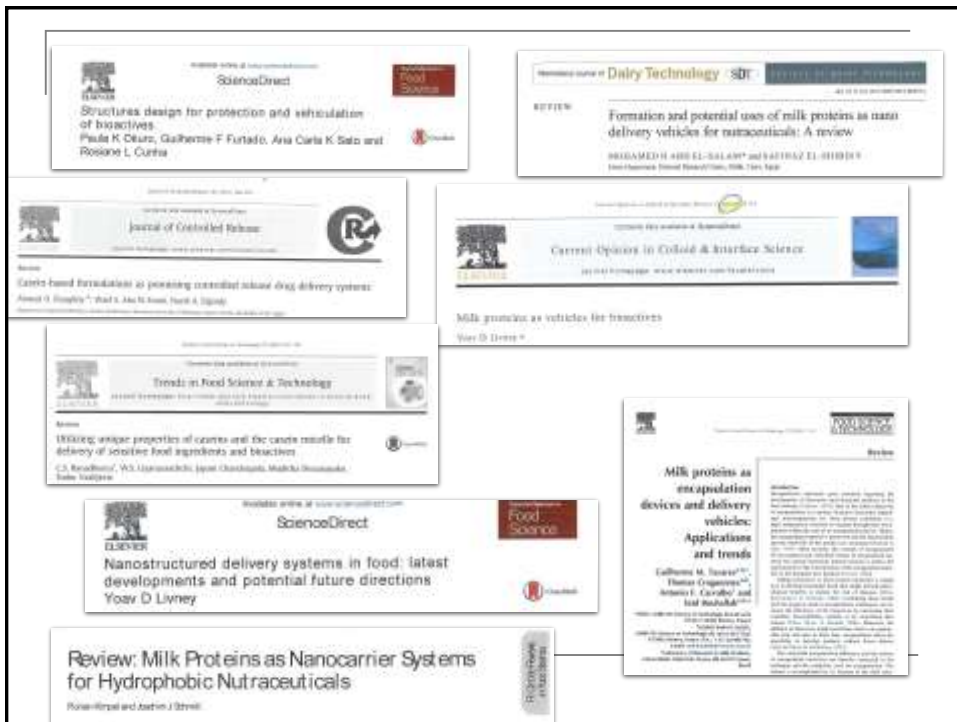

Recent reviews on casein micelles

Growing interest on nanoparticles with milk proteins

Citation Report: **59**
 (from **Web of Science Core Collection**)
 You searched for:
TOPIC: casein, nanoparticles, release

Objectives of this research

1. Characterize the parameters of interactions between casein and interesting molecules (association constants, stoichiometry,....)
2. Characterize the structures of the complexes
3. Characterize the stability of the complexes as a function of physico-chemical conditions
4. Characterize the biological behaviours of the complexes (protection effect, bio-utilisation, digestibility,...)

Interactions protéine-ligand

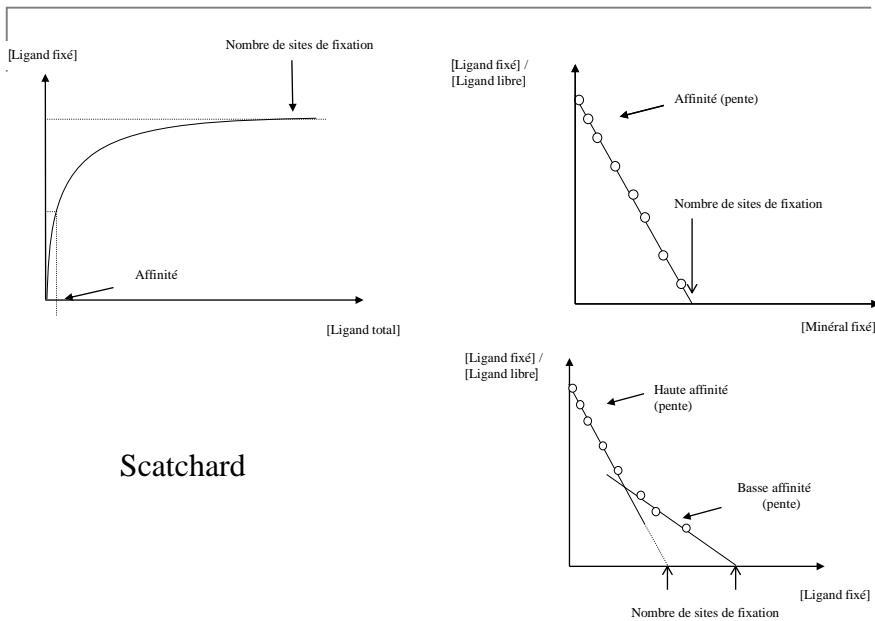

k_1 et k_2 : constantes de vitesse d'association et de dissociation

$$\frac{[\text{protéine}] [\text{ligand}]}{[\text{protéine-ligand}]} = \frac{k_1}{k_2} = K_d$$

Concentration en ligand qui permet la saturation de 50 % des sites récepteurs

K_d : constante d'équilibre de dissociation

K_a : constante d'équilibre d'association $\rightarrow 1/K_d$

Why caseins are good candidates to be nanoparticles ?

- Source having low price and renewable
- Natural biopolymer
- Easy to prepare at industrial scale
- Natural self-assembled nanostructure
- Can exist under different aggregation states :
 - Purified casein molecules
 - Sodium caseinate (CasNa)
 - Reassembled casein micelles (rCMs)
 - Native casein micelles (CMs) also named native phosphocaseinate

How caseins can interact with interesting molecules ?

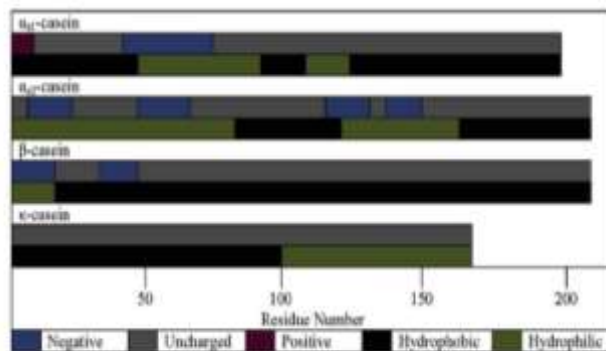

Fig. 2. Schematic diagram of the location of the mostly hydrophilic, hydrophobic, charged and uncharged regions along the casein chains at pH 6.6 (adapted and modified from Kesint, Meréndez-Aguirre, Hürich, Stohrbusch, & Weiss, 2013; Isalgard, 2003).

Electrostatic interactions \rightarrow charged molecules (ions)
Hydrophobic interactions \rightarrow hydrophobic molecules

Casein micelle as a natural nano-capsular vehicle for vitamin D2

- Vitamin D2 : fat-soluble essential for calcium metabolism
- Incorporation of vitamin D2 into re-assembly casein micelles : sodium caseinate + vit D2 + citrate + phosphate + calcium / pH maintained between 6.7- 7.0
- ~ 5.5 times more concentrated within the micelles than in the serum
- No modification of the morphology and average diameter of casein micelles
- Casein micelle : partial protection against UV-light-induced degradation to vitamin D2

19

Casein and vitamin D2

Table 1
 Analysis of vitamin D2 partition between the micellar (micelles) and the serum (supernatant) and vitamin D2 content of other liquid cases

	Amount of the total amount of the sample	Amount (D2)	Amount of the total amount of Vitamin D2 recovered by the analysis (20%, 100µg/L)
Micellar system	4.7% (2.4%)	440 µg/L	270% (2.4%)
Water supernatant	95.3% (4.6%)	8.0 µg/L	20% (4.6%)
Microcapsules (total system)	90.0%	432 µg/L	90%

Fig. 1. Size distribution of casein micelles containing 0.1% (a), 0.2% (b) and 0.5% (c) of vitamin D2.

Fig. 2. Electron microscopy (EM) images of casein micelles containing 0.1% (a), 0.2% (b) and 0.5% (c) of vitamin D2. The inset in the bottom right is a higher magnification of the EM image (c) that focuses on the particular surface that contains the vitamin D2.

This study demonstrated that CM can be used for nano-encapsulation of hydrophobic nutraceutical substances for potential enrichment of low- or non-fat food products.

CM were shown to serve as potential nano-vehicles for added nutraceuticals such as the fat-soluble vitamin D2 chosen here as a model for hydrophobic bioactive compounds. In terms of encapsulation efficiency, 27% of the vitamin recovered from the micelle suspension was found in the reformed micelles, which contained about 5.5 times higher concentration of the vitamin compared to the surrounding serum

β -casein and acid folic

- Folate : water-soluble **vitamin B9**
- Present mainly in leafy green vegetables and legumes.
- *In vivo*, acts as a coenzyme in one carbon transfer reactions required in the biosynthesis of DNA and RNA
- Folate reduces the risk of neural tube defects and influences the likelihood of developing vascular diseases and some cancers.
- Folic acid is commonly used for nutritional fortification and for formulation of pharmaceuticals.
- Folic acid is sensitive to ultraviolet (UV) light, which causes its decomposition to inactive photoproducts

β -casein and acid folic

Fig. 3. Fluorescence emission spectra of 10^{-5} M and 10^{-6} M folic acid in the presence of 10^{-5} M β -casein at concentrations of 0, 1, 2, 5, 10, and 20 μ M. The inset shows the fluorescence intensity as a function of the concentration of β -casein.

- β -Casein can interact with folic acid by hydrophobic contacts with a dissociation constant of $\sim 10^{-5}$ M.
- Binding to β -casein appears to reduce the photodecomposition of folic acid, more so at the higher protein concentration, and inhibits folic acid photodecomposition completely at 10 μ M.
- β -Casein = a carrier material suitable for folic acid delivery, and folic-acid- β -casein complex formation as a useful model of the interaction between proteins and bioactive molecules.

Curcumin-Casein micelle complexation

- Curcumin :

- Natural polyphenolic compound
- Lipophilic fluorescent molecules
- Low toxicity but a wide range of pharmaceutical activities including antioxidant, anti-inflammatory, antimicrobial, antiamyloid and antitumor properties

Intrinsic fluorescence of camel B-CN (5 $\mu\text{mol/L}$) in the presence of different [curcumin]

- **Fluorescence intensity of a protein is mainly due to Trp residues.** Camel B-CN contains 5 Tyr and 10 Phe residues, which are mainly located in the hydrophobic part of its primary structure, which is devoid of Trp (comparing to bovine B-CN which contains 1 Trp, 4 Tyr and 8 Phe residues).
- Interaction between curcumin and B-CN at different temperatures resulted in a **quenching of the intrinsic fluorescence at 280 nm**. Quenching of the protein fluorescence upon interaction with curcumin does not induce any shift in the spectra neither to blue nor to red.

Association of lipids with milk α - and β -caseins

F. Bouzara, L. Betzale, H.A. Tajmir-Banji

ABSTRACT

We report the molecular interaction and the binding sites of cholesterol (CHOL), 1,3-bis(sn)-phosphatidylcholine (BPC), diacylglycerol (DAG), and triacylglycerol (TAG) with α - and β -caseins in aqueous solution at physiological conditions. Fourier transform infrared (FTIR), fluorescence spectroscopy methods and molecular modeling were used to determine the binding sites of lipid-ligand complexes and the effect of lipid ionization on the stability and conformation of α - and β -caseins. Structural analysis showed that lipid head groups are mainly hydrophobic interact with caseins via hydrophobic interactions. The average number of binding sites occupied by lipid molecules on protein (n) were from 0.2 to 1.1. Binding showed different binding sites for α - and β -caseins toward lipid complexes with the free binding capacity from 0.0 to 1.0. Structural case conformation was altered by lipid association with a reduction of α -helix and β -sheet and an increase of random coil and turn structure suggesting a native protein unfolding. *Keywords:* CHOL, BPC, DAG, TAG, casein.

Casein and lipids

Table 1. Binding parameters for lipid-casein complexes.

Complexes	Casein	K _d (nM) (10 ⁶ M ⁻¹)	K _a (10 ⁶ M ⁻¹ s ⁻¹)	n
CHOL-casein	α	1.01 ± 0.1	1.3 ± 0.3	0.7 ± 0.1
	β	1.0 ± 0.3	1.0 ± 0.3	1.1 ± 0.2
DOPC-casein	α	0.5 ± 0.07	0.12 ± 0.03	0.6 ± 0.04
	β	0.15 ± 0.06	0.18 ± 0.04	0.7 ± 0.06
DHA-casein	α	2.0 ± 0.6	6 ± 0.2	0.7 ± 0.1
	β	1.7 ± 0.3	3.3 ± 0.5	0.9 ± 0.2
DHA-2-casein	α	1.5 ± 0.4	2.0 ± 0.5	1.1 ± 0.2
	β	2.1 ± 0.3	5.0 ± 0.7	1.0 ± 0.2

β-casein and celecoxib

Celecoxib : nonsteroidal anti-inflammatory drug for the treatment of rheumatoid arthritis and osteoarthritis.

(A) celecoxib in buffer (pH 6.8). Solubility of drug is low, and it arranges into large crystals.

(B) β-casein and celecoxib in buffer, at 20 mg/mL protein and protein:drug mole ratio

Cryo-TEM images show an increase in micellar diameter upon increasing drug loading.

- (A) 5 mg/mL β-casein, 1:1 protein:drug mole ratio,
- (B) 5 mg/mL β-casein, 1:8 protein:drug mole ratio,
- (C) 20 mg/mL β-casein only
- (D) 20 mg/mL β-casein, 1:15 protein:drug mole ratio

↳ Celecoxib is solubilized by β-casein.

↳ β-casein : nanocarrier of celecoxib

Development and characterization of a novel drug nanocarrier for oral delivery, based on self-assembled β-casein micelles

Casein and resveratrol

- **Resveratrol** : polyphenol found in the skin of grapes, apples, peanuts and in some traditional herbs.
- Consumption of plants and plant products that are rich in polyphenols has been related with protective effects against cardiovascular disease and certain forms of cancer
- Study of interaction between resveratrol and sodium caseinate by fluorescence

Variation of binding constant K and the number of binding sites n as a function of temperature and thermodynamic parameters of binding calculated using Stern-Volmer equation.

T (°C)	K	n	ΔH° (kJ mol ⁻¹)	ΔS° (J mol ⁻¹ K ⁻¹)	ΔG° (kJ mol ⁻¹)
25	5.11×10^5	1.27	0.988	-21.2	27.9
33	4.26×10^5	1.29	0.992	-20.8	-22.8
37	3.67×10^5	1.18	0.993	-20.9	-23.9

- The interaction between resveratrol (Res) and sodium caseinate (Na-Cas) has been studied by measuring fluorescence quenching of the protein by resveratrol. Quenching constants were determined using Stern-Volmer equation, which suggests that both dynamic and static quenching occur between Na-Cas and Res.
- Binding constants for the complexation between Na-Cas and Res were determined at different temperatures.
- The large binding constants ($3.7\text{--}5.1 \times 10^5 \text{ M}^{-1}$) suggest that **Res has strong affinity for Na-Cas**.
- This affinity decreases as the temperature is raised from 25 to 37°C.
- The binding involves both **hydrogen bonding and hydrophobic interaction**, as suggested by negative enthalpy change and positive entropy change for the binding reaction.
- **The present study indicates that Na-Cas may be used as a carrier of Res, a bioactive polyphenol which is insoluble in both water and oils.**

Casein and flutamide

- Flutamide (FLT) is an antiandrogenic agent presently used for monotherapy of androgen-dependent prostate cancer
- Low solubility → low bioavailability

(a) FLT in water; solubility of drug is poor, and it precipitates into large crystals,

(b) FLT in CAS micelles; this solution is clear, and no drug crystals are visible.

ABSTRACT: Lactotransferrin (LF) is a large globular protein in milk with iron-regulatory and bactericidal properties. At pH 6.5, LF (M = 78 kDa) carries a net (calculated) charge of +11. β -Casein (BCN) and κ -casein (KCN) are part of the casein micelle complex in milk. Both BCN and KCN are amphiphilic proteins with a molar mass of 24 and 19 kDa and carry net charges of -14 and -6, respectively. Both BCN and KCN form ring-like micelles, with 40 and 60 monomers, respectively. The net negative charges are located in the centers of the micelles. On mixing LF with the casein, coacervates are formed. We analyzed the structure of these coacervates using SAXS. It was found that LF binds to the centers of the micellar structures, at the charge neutrality point. BCN/LF and KCN/LF ratios at the charge neutrality point were found to be -1.1 and -5, respectively. We think that the findings are relevant for the protection mechanism of globular proteins in bodily fluids where unstructured proteins are abundant (saliva). The complexes will prevent denaturation of enzymes on specific charged groups on the globular protein.

Cartoon of the binding of lactotransferrin to BCN micelles. Lactotransferrin is depicted as a dumbbell according to protein structure in the Swiss Protein Data Bank.28

Casein as natural nanovehicle

Conclusion

Due to increase in the knowledge in dairy science and dairy technology

Possibility to have nanoparticles with different functions

Techno-functionality

↳ physico-chemical (pH, temperature, pressure,...) and enzymatical (proteases, TGase, desamidase, ...) modifications

Thermal stability, acid and rennet gels properties, emulsifying properties, etc

Health

↳ addition of external compounds :

- Ca,
- curcumin,
- vitamins,
- anticancer drug,
- etc
