- a link is made to the metadata record in Durham E-Theses
- the full-text is not changed in any way

The full-text must not be sold in any format or medium without the formal permission of the copyright holders.
Please consult the full Durham E-Theses policy for further details.

# Synthesis and Characterisation of 

## Some Main-Group Compounds with

## Bulky Electron-withdrawing

## Substituents

Stéphanie M. M. Cornet

## Graduate Society

## 14 APR 2003

A thesis submitted in part fulfillment of the requirements for the degree of Doctor of Philosophy at the University of Durham.

Table of Contents ..... ii
Table of Figures. ..... ix
Table of Equations and Schemes ..... xi
Table of Tables. ..... xiii
Abstract. ..... xvi
Acknowledgements ..... xix
Abbreviations ..... xxii
Chapter 1 ..... 1
Introduction ..... 1
1.1 Bulky and electron-withdrawing substituents ..... 2
1.1.1 Introduction ..... 2
1.1.2 1,3,5-tris(trifluoromethyl)benzene (FluoromesitylH, ArH) ..... 2
1.1.2.1 Introduction. ..... 2
1.1.2.2 Advantages of ArH ..... 4
1.1.2.3 Reaction with heavier main group elements or transition metals ..... 4
1.1.3 1,3-bis(trifluoromethyl)benzene (FluoroxylH, Ar'H) ..... 23
1.1.3.1 Properties ..... 23
1.1.3.2 Comparison between ArH and Ar'H ..... 23
1.1.3.3 Reaction with heavier main group elements or transition metals ..... 25
1.2 Diphosphenes ..... 28
1.2.1 Fluoromes ..... 29
1.2.1.1 Synthetic route ..... 29
1.2.1.2 Coordination chemistry ..... 31
1.2.2 Fluoroxyl ..... 32
References ..... 33
Chapter 2 ..... 38
Group 13 Derivatives ..... 38
2.1 Introduction. ..... 39
2.2 Reaction with 2,4,6-tris(trifluoromethyl)phenyl lithium (ArLi). ..... 41
2.3 Reaction with a 2,6-bis(trifluoromethyl)phenyl lithium / 2,4- bis(trifluoromethyl)phenyl lithium mixture (Ar'Li/Ar"Li)) ..... 46
2.4 Boronic Acids. ..... 54
2.5 Discussion. ..... 57
2.5.1 Comparison of the chemical shifts. ..... 57
2.5.2 Comparison of the molecular structures ..... 59
2.5.3 Short contact distances ..... 61
2.5.4 Optimised geometry ..... 61
2.6 Attempted reactions with Aluminium ..... 62
2.6.1 Reaction with 2,6-bis(trifluoromethyl)phenyl lithium (Ar'Li) / 2,4- bis(trifluoromethyl)phenyl lithium (Ar"Li) ..... 62
2.6.2 Reaction with 2,4,6-tris(trifluoromethyl)phenyl lithium (Ar'Li) ..... 62
2.7 Experimental ..... 64
2.7.1 Introduction ..... 64
2.7.2 Synthesis of ArH ..... 65
2.7.3 Preparation of ArLi ..... 67
2.7.4 Preparation of $\mathrm{Ar}^{\prime} \mathrm{Li} / \mathrm{Ar}^{\prime \prime} \mathrm{Li}$ ..... 67
2.7.5 Synthesis of $\mathrm{ArBCl}_{2}$ ..... 68
2.7.6 Synthesis of $\mathrm{Ar}_{2} \mathrm{BF}$ ..... 68
2.7.7 Synthesis of $\mathrm{Ar}^{\prime} \mathrm{BCl}_{2}$ ..... 69
2.7.8 Synthesis of $\mathrm{Ar}^{2}{ }_{2} \mathrm{BF}$ ..... 60
2.7.9 Synthesis of $\mathrm{Ar}^{\prime}{ }_{3} \mathrm{~B}$ ..... 60
References ..... 72
Chapter 3 ..... 74
Group 14 Derivatives ..... 74
3.1 Introduction ..... 75
3.1.1 Organosilicons ..... 75
3.1.2 Organogermanium derivatives ..... 76
3.1.3 Organotin compounds ${ }^{4,5}$ ..... 76
3.2 Silicon derivatives ..... 78
3.2.1 Reaction of $\mathrm{SiCl}_{4}$ with 2,4,6-tris(trifluoromethyl)phenyl lithium ..... 78
3.2.2 Reaction of $\mathrm{SiCl}_{4}$ with a 2,6-bis(trifluoromethyl)phenyl lithium / 2,4- bis(trifluoromethyl)phenyl lithium mixture ( $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ ) ..... 79
3.3 Germanium derivatives ..... 86
3.3.1 Reaction of $\mathrm{GeCl}_{4}$ with 2,4,6-tris(trifluoromethyl)phenyl lithium (ArLi) ..... 86
3.3.2 Reaction of $\mathrm{GeCl}_{4}$ with a 2,6-bis(trifluoromethyl)phenyl lithium / 2,4- bis(trifluoromethyl)phenyl lithium mixture (Ar'Li/Ar"Li) ..... 91
3.4 Tin derivatives. ..... 92
3.4.1 Reaction of $\mathrm{SnCl}_{4}$ with 2,4,6-tris(trifluoromethyl)phenyl lithium (ArLi) ..... 92
3.4.2 Reaction of $\mathrm{SnCl}_{4}$ with a 2,6-bis(trifluoromethyl)phenyl lithium / 2,4- bis(trifluoromethyl)phenyl lithium mixture (Ar'Li/Ar"Li) ..... 93
3.5 Discussion ..... 96
3.5.1 Solution-state NMR Spectroscopy ..... 96
3.5.2 X-ray Crystallography ..... 98
3.6 Experimental ..... 101
3.6.1 Introduction ..... 101
3.6.2 Synthesis of $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$ ..... 101
3.6.3 Synthesis of $\mathrm{Ar}_{2}{ }_{2} \mathrm{SiCl}_{2}$ ..... 102
3.6.4 Synthesis of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiF}_{2}$ ..... 103
3.6.5 Synthesis of $\mathrm{ArGeCl}_{3}$ ..... 103
3.6.6 Synthesis of $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ ..... 104
3.6.7 Synthesis of $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ ..... 105
3.6.8 Synthesis of $\mathrm{ArSnCl}_{3} / \mathrm{Ar}_{2} \mathrm{SnCl}_{2}$ ..... 105
3.6.9 Synthesis of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2} / \mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{SnCl}_{2}$ ..... 106
References ..... 108
Chapter 4 ..... 110
Group 15 Derivatives ..... 110
4.1 Introduction. ..... 111
4.2 Phosphorus Derivatives ..... 112
4.2.1 Reaction with 2,4,6-tris(trifluoromethyl)phenyl lithium (ArLi) ..... 112
4.2.1.1 $\quad \mathrm{ArPCl}_{2}$ ..... 112
4.2.1.2 $\quad \mathrm{Ar}_{2} \mathrm{PCl}$ ..... 113
4.2.1.3 $\mathrm{ArPBr}_{2}$ ..... 117
4.2.1.4 $\quad \mathrm{Ar}_{2} \mathrm{PBr}$ ..... 121
4.2.2 Reaction with 2,6-bis(trifluoromethyl)phenyl lithium (Ar'Li) / 2,4- bis(trifluoromethyl)phenyl lithium (Ar"Li) ..... 121
4.2.2.1 $\quad \mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ ..... 122
4.2.2.2 $\quad \mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ ..... 122
4.2.2.3 $\mathrm{Ar}{ }_{2}{ }_{2} \mathrm{PCl}$ ..... 123
4.2.2.4 $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime 2} \mathrm{PCl}$ ..... 127
4.2.2.5 $\quad \mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ ..... 131
4.2.2.6 $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ ..... 131
4.2.2.7 $\quad \mathrm{Ar}{ }_{2} \mathrm{PBr}$ ..... 132
4.2.2.8 $\quad \mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PBr}$ ..... 134
4.2.2.9 $\mathrm{Ar}{ }_{2}{ }_{2} \mathrm{PH}$ ..... 134
4.2.2.10 Ar'Ar"PH ..... 136
4.2.2.11 Attempted synthesis of $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PF}$ ..... 137
4.2.2.12 Attempted synthesis of Ar" ${ }_{2} \mathrm{PF}$ ..... 137
4.2.2.13 ArAr' $\mathrm{PCl} / \mathrm{ArAr}^{\prime} \mathrm{PCl}$ ..... 138
4.3 Arsenic Derivatives ..... 139
4.3.1 Reaction with 2,4,6-tris(trifluoromethyl)phenyl lithium (ArLi) ..... 140
4.3.1.1 $\quad \mathrm{ArAsCl}_{2}$ ..... 140
4.3.1.2 $\quad \mathrm{Ar}_{2} \mathrm{AsCl}$ ..... 140
4.3.1.3 $\mathrm{ArAsBr}_{2}$ ..... 141
4.3.1.4 $\quad \mathrm{Ar}_{2} \mathrm{AsBr}$ ..... 141
4.3.1.5 $\mathrm{ArAsH}_{2}$ ..... 142
4.3.1.6 $\mathrm{Ar}_{2} \mathrm{AsH}$ ..... 142
4.3.2 Reaction with 2,6-bis(trifluoromethyl)phenyl lithium (Ar'Li) / 2,4- bis(trifluoromethyl)phenyl lithium (Ar"Li) ..... 143
4.3.2.1 $\mathrm{Ar}^{\prime} \mathrm{AsCl}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}_{2}$ ..... 143
4.3.2.2 Ar'Ar"AsCl ..... 144
4.3.2.3 $\mathrm{Ar}^{\prime} \mathrm{AsBr}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{AsBr}_{2}$ ..... 148
4.3.2.4 Ar'Ar"AsBr ..... 148
4.3.2.5 $\mathrm{Ar}{ }_{2}{ }^{2} \mathrm{AsBr}$ ..... 150
4.3.2.6 Ar'Ar"AsH. ..... 151
4.4 Antimony and bismuth derivatives ..... 154
4.4.1 Antimony derivatives ..... 154
4.4.1.1 $\mathrm{Ar}^{\prime} \mathrm{SbCl}_{2} / \mathrm{Ar}^{\prime} \mathrm{SbCl}_{2}$ ..... 154
4.4.1.2 $\mathrm{Ar}_{2}{ }_{2} \mathrm{SbCl} / \mathrm{Ar}{ }_{2} \mathrm{SbCl}^{2}$ ..... 155
4.4.1.3 $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime}{ }_{2} \mathrm{Sb}$ ..... 156
4.4.2 Bismuth derivatives ..... 160
4.5 Discussion ..... 160
4.5.1 Solution-state NMR spectroscopy ..... 160
4.5.2 X-ray Crystallography ..... 162
4.6 Experimental ..... 168
4.6.1 Introduction ..... 168
4.6.2 Synthesis of $\mathrm{ArPCl}_{2}$ ..... 169
4.6.3 Synthesis of $\mathrm{Ar}_{2} \mathrm{PCl}$ ..... 170
4.6.4 Synthesis of $\mathrm{ArPBr}_{2}$ ..... 170
4.6.5 Synthesis of $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2} / \mathrm{Ar}^{\prime}{ }^{\prime} \mathrm{PCl}_{2}$ ..... 171
4.6.6 Synthesis of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PCl}$ ..... 172
4.6.7 Synthesis of $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$, and $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PBr} / \mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PBr}$ ..... 172
4.6.8 Synthesis of Ar" ${ }_{2} \mathrm{PH}$ ..... 173
4.6.9 Synthesis of Ar'Ar"PH ..... 174
4.6.10 Attempted synthesis of $\mathrm{Ar}_{2}{ }_{2} \mathrm{PF}$ ..... 175
4.6.11 Attempted synthesis of Ar'Ar'PF ..... 175
4.6.12 Synthesis of ArAr'PCl/ArAr"PCl ..... 176
4.6.13 Synthesis of $\mathrm{ArAsCl}_{2} / \mathrm{Ar}_{2} \mathrm{AsCl}$ ..... 176
4.6.14 Synthesis of $\mathrm{ArAsH}_{2}$ ..... 177
4.6.15 Synthesis of $\mathrm{ArAsBr}_{2} / \mathrm{Ar}_{2} \mathrm{AsBr}$ ..... 177
4.6.16 Synthesis of $\mathrm{Ar}_{2} \mathrm{AsH}$ ..... 178
4.6.17 Synthesis of $\mathrm{Ar}^{\prime} \mathrm{AsCl}_{2} / \mathrm{Ar}^{\prime} \mathrm{AsCl}_{2} / \mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}$ ..... 178
4.6.18 Synthesis of $\mathrm{Ar}^{\prime} \mathrm{AsBr}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{AsBr}_{2}, \mathrm{Ar}_{2}{ }_{2} \mathrm{Br}$ and $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsBr}$ ..... 179
4.6.19 Synthesis of Ar'Ar"AsH ..... 181
4.6.20 Synthesis of $\mathrm{Ar}^{\prime} \mathrm{SbCl}_{2} / \mathrm{Ar}^{\prime} \mathrm{SbCl}_{2} / \mathrm{Ar}^{\prime}{ }_{2} \mathrm{SbCl} / \mathrm{Ar}_{2} \mathrm{SbCl} / \mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime}{ }_{2} \mathrm{Sb}$ ..... 181
4.6.26 Attempted reaction between $\mathrm{Ar}^{\prime} \mathrm{Li} / \mathrm{Ar}^{\prime \prime} \mathrm{Li}$ and $\mathrm{BiCl}_{3}$ ..... 182

Synthesis of Platinum Complexes ..... 214
6.1 Introduction ..... 215
6.2 Platinum complexes ..... 215
6.2.1 Platinum complexes as chemotherapeutic agents ..... 217
6.2.2 NMR spectroscopy ..... 217
6.3 The "platinum dimer" ..... 218
6.3.1 Reactions with low coordinate phosphorus species ..... 219
6.4 Synthesis of some Platinum-Phosphane Compounds ..... 222
6.4.1 Synthesis of the Pt dimer ..... 222
6.4.2 Reaction between $\mathrm{Ar}^{\prime} \mathrm{Ar} " \mathrm{PCl}$ and Pt dimer ..... 224
6.4.3 Reaction between $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PCl}$ and $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ ..... 225
6.4.4 Reaction between $\mathrm{Ar}{ }_{2} \mathrm{PH}$ and $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ ..... 226
6.4.5 Reaction between $\mathrm{ArPBr}_{2}$ and $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ ..... 227
6.4.6 Reaction between $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ and $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ ..... 228
6.4.7 Reaction between $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PBr}$ and $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ ..... 230
6.4.8 Synthesis of $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ ..... 232
6.4.9 Reaction between $\mathrm{ArPBr}_{2}$ and $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ ..... 233
6.4.10 Reaction between $\mathrm{Ar}_{2}{ }_{2} \mathrm{PBr}$ and $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ ..... 234
6.4.11 Reaction between $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2}$ and $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ ..... 234
6.5 Attempted synthesis of Platinum-Arsane Compounds ..... 236
6.6 Discussion ..... 236
6.6.1 Change in the chemical shifts ..... 236
6.6.2 Comparison of the coupling constants ..... 238
6.7 Experimental ..... 240
6.7.1 Introduction ..... 240
6.7.2 Synthesis of $c i s-\left[\mathrm{PtCl}_{2}\left(\mathrm{PhCN}_{2}\right]\right.$ ..... 241
6.7.3 Synthesis of $c i s-\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)_{2}\right]$ ..... 241
6.7.4 Synthesis of trans- $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ ..... 242
6.7.5 Synthesis of trans- $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)_{2}\left(\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PCl}\right)\right]$ ..... 242
6.7.6 Synthesis of trans- $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2}{ }_{2} \mathrm{PCl}\right)\right]$ ..... 242
6.7.7 Synthesis of trans $-\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2}{ }_{2} \mathrm{PH}\right)\right]$ ..... 243
6.7.8 Synthesis of cis-[ $\left.\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{ArPBr}_{2}\right)\right]$ ..... 243
6.7.9 Synthesis of $c i s-\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2}\right)\right]$ and cis- $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]$ ..... 244
6.7.10 Synthesis of trans- $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2}{ }_{2} \mathrm{PBr}\right)\right]$ ..... 244
6.7.11 Synthesis of cis-[ $\left[\mathrm{PBBr}_{2}\left(\mathrm{PhCN}_{2}\right]\right.$ ..... 245
6.7.12 Synthesis of $c i s-\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)_{2}\right]$. ..... 245
6.7.13 Synthesis of trans-[ $\left.\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ ..... 245
6.7.14 Synthesis of cis-[ $\left.\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{ArPBr}_{2}\right)\right]$ ..... 246
6.7.15 Synthesis of trans- $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2}{ }_{2} \mathrm{PBr}\right)\right]$ ..... 246
6.7.16 Synthesis of cis-[ $\left.\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]$, trans $-\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBrr}_{2}\right)\right]$ and cis- $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]$ ..... 247
6.7.17 Attempted synthesis of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{ArAsCl}_{2}\right)\right]$ ..... 247
6.7.18 Attempted synthesis of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2} \mathrm{AsCl}\right)\right]$ ..... 248
6.7.19 Attempted synthesis of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}\right)\right]$ ..... 248

# Abstract <br> Synthesis and Characterisation of Some Main-Group Compounds with Bulky Electron-withdrawing Substituents 

Several new group 13, 14 and 15 derivatives with the ligands $2,4,6-\left(\mathrm{CF}_{3}\right)_{3} \mathrm{C}_{6} \mathrm{H}_{2}$ (Ar), 2,6$\left(\mathrm{CF}_{3}\right)_{2} \mathrm{C}_{6} \mathrm{H}_{3}$ (Ar') and / or $2,4-\left(\mathrm{CF}_{3}\right)_{2} \mathrm{C}_{6} \mathrm{H}_{3}$ (Ar") have been prepared. They have been characterised by multinuclear NMR spectroscopy and, for all isolated compounds, by elemental analysis and, where possible, single crystal X-ray diffraction.

Reaction of ArLi or the mixture $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ with $\mathrm{BCl}_{3}$ has led to the characterisation of several mono- and disubstituted compounds, but attempted substitution in $\mathrm{AlCl}_{3}$ was unsuccessful. Reaction of $\mathrm{ECl}_{4}(\mathrm{E}=\mathrm{Si}, \mathrm{Ge}, \mathrm{Sn})$ with the $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}^{\prime \prime} \mathrm{Li}$ mixture yielded predominantly the less sterically hindered disubstituted product $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{ECl}_{2}$ for $\mathrm{E}=\mathrm{Si}$ and Ge but to $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{ECl}_{2}$ for $\mathrm{E}=\mathrm{Sn}$. In the case of B or Si , chlorine exchange is observed and $\mathrm{Ar}_{2} \mathrm{BF}$, $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$ and $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$ have been synthesised. $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$ is the only product identified in the reaction of ArLi with $\mathrm{SiCl}_{4}$.

Reaction of ArLi or the $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime \prime} \mathrm{Li}$ mixture, in an appropriate ratio, with group 15 derivatives gave rise to several mono-or disubstituted compounds of the type $\mathrm{ArEX}_{2}, \mathrm{Ar}_{2} \mathrm{EX}$, $\mathrm{Ar}^{\prime} \mathrm{EX}_{2}, \mathrm{Ar}^{\prime \prime} \mathrm{EX}_{2}, \mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{EX}$ and $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{EX}\left(\mathrm{E}=\mathrm{P}\right.$ or $\mathrm{As} ; \mathrm{X}=\mathrm{H}, \mathrm{Cl}$ or Br ). ${ }^{19} \mathrm{~F}$ NMR spectra of Ar'Ar'EX show that, for the two ortho- $\mathrm{CF}_{3}$ groups of the Ar ' moiety, there is free rotation of the aryl group around the central atom. A series of variable temperature studies has been carried out, and allowed the determination of the rotational energy barrier of the molecule. For the first time, the molecular structures of derivatives containing three fluoroxyl ligands have been determined ( $\mathrm{Ar}{ }^{\prime}{ }_{3} \mathrm{~B}$ and $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime}{ }_{2} \mathrm{Sb}$ ).

The synthesis of some new platinum complexes has been facilitated by reaction of phosphanes with the platinum dimer $\left[\left(\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}\right.$ or $\left[\left(\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}\right.$. Reactions of the platinum dimer with arsane derivatives have not been successful. Halogen exchange was observed between bromophosphane ligands and Cl groups on the platinum. Attempts have been made to synthesise new $\mathrm{P}=\mathrm{E}$ derivatives containing the electronwithdrawing substituents Ar or Ar ' via reaction with the chlorine abstractor $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$. $\mathrm{ArP}=\mathrm{PAr}$ and $\mathrm{Ar}^{\prime} \mathrm{P}=\mathrm{PAr}$ ' have been prepared. Synthesis of the first phosphaalkyne containing Ar or Ar ' has been attempted by reacting a phosphaalkene with a $\operatorname{Pt}(0)$ species.

## Declaration

This work was conducted in the Department of Chemistry at the University of Durham between October 1999 and October 2002. The work has not been submitted for a degree in this, or any other university. It is my own work, unless otherwise indicated.

# "And now here is my secret, a very simple secret: It is only with the heart that one can see rightly; what is essential is invisible to the eye" 

"Et maintenant voici mon secret, c'est très simple: On ne voit bien qu'avec le Coeur, l'essentiel est invisible pour les yeux"

Le Petit Prince.
Antoine de St Exupery

## Acknowledgements

First and foremost, I would like to thank my supervisor, Dr. Keith Dillon, for his constant support and encouragement throughout my time in Durham. Thank you for making me enjoy research so much.

I am very grateful to all the technical staff: glassblowers, technicians, cleaners and everyone else who kept the department running and have helped to make my time here, at Durham, all the more pleasant. Thanks Val for keeping our lab as clean and tidy as possible and Dave Hunter for his help with the high-pressure experiments and his company in the "roof lab".
Special thanks go to Alan, Catherine and Ian in the NMR service for their kindness and good mood. They somehow managed to keep smiling even when I asked for loads of variable temperature experiments!

My gratitude goes to Dr Paul Hazendonk and Dr Mark Fox for their help with the calculations. Many thanks extend to Dr Andrés Goeta and Dr Andrei Batsanov for determining some of my crystal structures, and a big hug to Amber Thompson for struggling with most of my crystals but after hours of hard work, succeeding in solving the structures.

Thank to all my colleagues and friends in the department: John, Aileen, Mark, Steven, Mark and David, Bob who had to share the lab 108 with a "frenchy" and for teaching me some nice English and Geordie expressions; Ben, I will miss our tea break and after work discussions; Lorna, Alison for our mad discussions and gym sessions; the "French connection" for their precious friendship, Elodie and Anne, for your friendship, your patience and teaching me how to cook; Jordan for your energy, your good mood and your support; Amel for your supporl and your kindness, Samia, Christophe and Romain for entertaining our lunchbreaks.
I met so great people since I arrived in Durham: Agathi, Michelle, Barbara, Shaheen, Bahma, etc, a part of me is now spread all over the world. May our friendship last forever despite the distances.
Sonia, without you, I would not have reached the end. I thank you for everything: your presence, your support, and our long conversations, for being my friend.

And everyone back to France, I wish to thank :

- the "chemistry gang". You all know who you are and if I try to name you all I'd sure miss someone out. Instead, I'll just thank you all for the laughs, and particularly, Sophe, my
half for practical classes and also your friendship. Soph, who were there for the good and bad time.
- the "scout family", Laurent, Julie, Fabien, Sandra, Cecile. Special hugs go to Mapie and Jeannot for their support when needed and letting me stay at their place so many times.
- the long term friends: Fred, Marina jusl for being there.
- and everyone I could have forgolten.

At last, I would like to thank my family, my parents who always believed in me, Cyril, Frédérique and Thierry, my grandmothers for their support and encouragements. Thanks are given for your letters, which kept me going throughout those three years. Thanks also go to my dad, my granddad and my uncle who, unfortunately, will not have the chance to read this thesis. Without all of you, this would have not been possible.

## Remerciements

En premier lieu, je souhaite remercier mon superviseur, Dr Keilh Dillon, pour son soutien et ses encouragements au cours de ces trois années a Durham. Merci pour m'avoir fait aimer la Recherche.

J'exprime toute ma gratitude à tout le personnel technique du département: les verriers, les techniciens, les femmes de ménages et tous ceux qui, de près ou de loin, aident à l'organisation du département. Merci à Val pour le ménage de notre labo et à Dave Hunter pour son aide avec les experiences à haute pression ainsi que pour m'avoir tenu compagnie dans le "roof lab". Un merci tout particulier au personnel de RMN, Alan, Catherine et Ian pour leur gentillesse et leur bonne humeur.

Ma gratitude va aussi à Dr Paul Hazendonk et Dr Mark Fox pour leur aide avec les calculs inclus dans ce travail.

Merci à Dr Andrés Goeta, Dr Andrei Batsanov pour la détermination de certaines structures crystallines. La plupart des structures ont été déterminées par Amber Thompson, que je remercie de sa patience et sa détermination.

Merci à tous mes collegues et amis du Département:

- John, Aileen, Mark, Steven, David et Bob qui ont partagé le lab 108 avec une "frenchy", et avoir aidé à l'amélioration de mon vocabulaire anglais et Geordie;
- Ben, nos pauses cafés, nos parties de solitaires, et nos discussions vont me manquer;
- Lorna et Alison pour nos folles conversations, votre amitié et nos sessions sportives.
- La "French connection" pour votre précieuse amitié: Elodie el Anne pour votre soutien, vorre patience et vos leçons de cuisine; Jordan pour ta joie de vivre et ton soutien; Amel pour ta gentillesse et ton amitié. Samia, Christophe et Romain pour avoir animé nos pauses dêjeuner.

J'ai rencontré à Durham, des personnes formidables: Agathi, Michelle, Barbara, Shaheen, Bahma, ... une part de moi est dispersée au quatre coins du monde. J'espère que notre amitić durera malgré la distance.

Sonia, sans toi, je n'y serai pas arrivé. Merci pour tout: ta présence, ton soutien, nos longues conversations téléphoniques. Merci d'être mon amie.

Un grand merci à tous ceux qui sont resté en France:

- "le gang de chimie": s'il vous arrive de lire ces lignes, vous vous reconnaitrez car si j'essaie de nommer tout le monde, je vais certainement en oublier. Merci pour tous les bons moments passés ensemble. Un merci particulier à Sophe, ma binome, et Soph, copines des bons et mauvais moments.
- le "famille scoute": Laurent, Julie, Fabien, Sandra, Cécile. Un merci parliculier à Mapie et Jeannot pour votre soutien et pour votre hospitalité.
- les amies de longues ... très longue date: Fred, Marina.
- el tous ceux que j'aurai pu oublier.

Enfin, je souhaite remercier ma famille: mes parents pour avoir toujours cru en moi, Cyril, Frédérique et Thierry, mes grand-mères pour m'avoir encouragé et soutenu. Merci à Papa, Papy et Jacques qui, malheureusement, n'auront pas la chance de lire cette thèse. Sans vous tous, ceci n'aurait jamais abouti.

## Chapter 1

## Introduction

### 1.1 Bulky and electron-withdrawing substituents

### 1.1.1 Introduction

The synthesis of multiple bonds between main group elements is generally achieved using kinetic stabilisation methods by the use of sterically demanding substituents. ${ }^{1}$ The employment of a substantial number of bulky ligands appeared to be successful: $\mathfrak{t}$-butyl, mesityl, 2,4,6-tri(i-propyl)phenyl, 2,4,6-tri-(t-butyl)phenyl (supermesityl), tris(trimethylsilyl)methyl, etc. Bulky amido ligands such as $-\mathrm{N}\left(\mathrm{SiMe}_{3}\right)_{2},-\mathrm{N}\left(\mathrm{SiMe}_{2} \mathrm{Ph}\right)_{2}$ or $-\mathrm{Nmes}\left(\mathrm{Bmes}_{2}\right)^{2}$ have also shown great ability for the stabilisation of transition metal complexes with low coordination numbers. In addition, the use of bulky substituents to prepare multiple bond compounds such as $\mathrm{Si}=\mathrm{N},{ }^{3} \mathrm{Si}=\mathrm{P},{ }^{4}$ and $\mathrm{As}=\mathrm{As}{ }^{5}$ has been described. Thus, the ligands 2,4,6-tris(trifluoromethyl)phenyl (fluoromes) and 2,6bis(trifluoromethyl)phenyl (fluoroxyl) should also be regarded as capable of stabilising the same kinds of compounds.

### 1.1.2 1,3,5-tris(trifluoromethyl)benzene (FluoromesitylH, ArH)

### 1.1.2.1 Introduction

1,3,5-Tris(trifluoromethyl)benzene was first prepared by McBee and Leech in 1947.6 Later, Chambers et al ${ }^{7}$ reported a new synthesis of this compound. This method involves the fluorination of benzene-1,3,5-tricarboxylic acid with $\mathrm{SF}_{4}$ at high temperatures, to obtain the compound in $33 \%$ yield after work-up. Subsequently, Edelmann and coworkers ${ }^{8}$ managed to increase this yield to $95 \%$.

Equation 1.1: Synthesis of ArH

Fluoromes is a very interesting ligand because of the ability of ArH to react with $\mathrm{n}-\mathrm{BuLi}$ to give the lithiated product ArLi.

The first report concerning ArLi dates back to 1950 by McBee and Sanford. ${ }^{9}$ In 1987, Chambers et al ${ }^{7}$ described an improved synthesis via direct metallation of ArH with nBuLi.

## Equation 1.2: Synthesis of ArLi

It has been found very convenient to prepare ArLi in situ and use the resulting solutions in diethyl ether/hexanes without further purification for subsequent reactions. [ $\left.\mathrm{ArLi} . \mathrm{Et}_{2} \mathrm{O}\right]_{2}$ can be isolated by complete removal of the solvent and recrystallisation of the residue from hexanes. 10

ArLi can be used to prepare numerous organometallic compounds. It can also be included in compounds of main group elements such as $\mathrm{P}, \mathrm{Ge}, \mathrm{Sn}, \mathrm{As}$, etc, usually by reaction with a suitable halogeno-derivative of the element.

### 1.1.2.2 Advantages of ArH

- Properties

Pure $1,3,5\left(\mathrm{CF}_{3}\right)_{3} \mathrm{C}_{6} \mathrm{H}_{3}$ is a stable colourless liquid which boils at $118^{\circ} \mathrm{C}$ under atmospheric pressure. It has a faint, characteristic odour.

## - Comparison with aryl or alkyl groups

By comparison with other aryl and alkyl groups, Ar is more oxygen- and moisture-stable when bonded to a main group element. Sterically, Ar is more bulky than 2,4,6trimethylphenyl (mesityl), and less than 2,4,6-tri-butylphenyl (supermesityl).

When fluoromes is bonded to another element, the positions of the $\mathrm{CF}_{3}$ groups play an important role:

- ortho and para $\mathrm{CF}_{3}$ groups cause a withdrawal of electrons from the atom to which they are bonded. This element becomes then less electron-rich and less susceptible to electrophilic attack;
- as $\mathrm{CF}_{3}$ groups are bulky electron-withdrawing groups, they are sterically hindering when they are in the ortho-position. Thus, any attack on the element to which the fluoromes ligand is attached is restricted. The $\mathrm{CF}_{3}$ groups can also interact with this atom.

### 1.1.2.3 Reaction with heavier main group elements or transition metals

During the last 15 years, the Ar ligand has been demonstrated to be a highly versatile building block in main group chemistry. Due to its ideal combination of sterically and electronically stabilising effects, it has been successfully employed in the stabilisation of low coordination numbers around various main groups elements (groups 13, 14, 15, 16) and transition metals.

The easiest way to attach an element to the ligand is to react the lithiated compound ArLi with a metal halide, as described by Chambers and co-workers: ${ }^{7}$

$$
\mathrm{xArLi}+\mathrm{MX}_{\mathrm{n}} \longrightarrow \mathrm{Ar}_{\mathrm{x}} \mathrm{MX}_{\mathrm{n}-\mathrm{x}}+\mathrm{xLiX}
$$

## - Group 13 derivatives

Very little use of the fluoromes ligand has been made in the context of the group 13 elements.

Goodwin 11,12 first reported the reaction of ArLi with boron trichloride to prepare $\mathrm{ArBCl}_{2}, \mathrm{Ar}_{2} \mathrm{BCl}$, and $\mathrm{Ar}_{3} \mathrm{~B}$. Interestingly, the formation of $\mathrm{Ar}_{2} \mathrm{BF}$ via a chlorine/fluorine exchange was also mentioned.

More recently, Gibson et all ${ }^{13}$ reported the synthesis of a new boronic acid $\mathrm{Ar}_{2} \mathrm{~B}(\mathrm{OH})$ and the preparation of transition metal complexes containing $-\mathrm{OBAr}_{2}$. In a study of fluorophenylboron azides, Fraenk and co-workers ${ }^{14}$ described the preparation and molecular structure of $\mathrm{Ar}_{2} \mathrm{BN}_{3}$ and $\mathrm{Ar}_{2} \mathrm{BOH}$.

Figure 1.1: Molecule of $\mathrm{Ar}_{2} \mathrm{BN}_{3}$

No attempts have been reported with aluminium or thallium so far.

In 1993, Schluter et al ${ }^{15}$ synthesised the first Ar derivatives of indium and gallium, and proved the capability of the fluoromes ligand to stabilise either $\mathrm{Ga}(\mathrm{III})$ or $\operatorname{In}(\mathrm{III})$ derivatives with M-M bonds:

$$
\mathrm{MCl}_{\mathrm{x}}+\mathrm{ArLi} \xrightarrow[-78^{\circ} \mathrm{C}]{\mathrm{Et}_{2} \mathrm{O}} \mathrm{Ar}_{2} \mathrm{M}-\mathrm{MAr}_{2} \quad(\mathrm{M}=\mathrm{In}, \mathrm{Ga})
$$

The Ar ligand has also permitted the isolation of triaryl compounds $\mathrm{Ar}_{3} \operatorname{In}$ or $\mathrm{Ar}_{3} \mathrm{Ga} .{ }^{16}$ Interestingly, the reaction of ArLi with $\mathrm{GaCl}_{3}$ gives a diethyl ether adduct, which when heated to $75^{\circ} \mathrm{C}$ leads to a dimeric product $[\mathrm{ArGa}(\mu-\mathrm{Cl}) \mathrm{Cl}]_{2}$

$$
\mathrm{ArLi}+\mathrm{GaCl}_{3} \cdot \mathrm{Et}_{2} \mathrm{O} \xrightarrow{75^{\circ} \mathrm{C}}[\mathrm{ArGa}(\mu-\mathrm{Cl}) \mathrm{Cl}]_{2}
$$

The trans isomer is formed preferentially because this conformation minimises the repulsions between the Ar moeties.

The chemistry of the 2,4,6-tris(trifluoromethyl)phenyl ligand with group 13 elements leads to the formation of mono, di- and tri-substituted compounds. M-M bonds and dimeric products have also been prepared. However, this group of elements remains an open field for the study of the Ar ligand, since just a few examples have been published.

## - Group 14 derivatives

Contrary to group 13, there has been a wide use of the Ar ligand with group 14 elements. This includes a variety of purely organic compounds. A number of carbon-carbon reactions have been studied by Chambers and Filler. 7,17 Among the products is the carboxylic acid ArCOOH , the synthesis of which is simple and straightforward. Due to its strong steric hindrance, ArCOOH failed to undergo reactions such as esterification with ethanol. ${ }^{17}$ Aldehydes and alcohols have also been prepared.

Equation 1.3: Synthesis of ArCOOH

Only four silicon derivatives have been described: $\mathrm{ArSiMe}_{3},{ }^{7} \mathrm{Ar}_{2} \mathrm{SiF}_{2},{ }^{18} \mathrm{Ar}_{2} \mathrm{SiHF}$ and $\mathrm{Ar}_{2} \mathrm{SiH}_{2} .{ }^{19} \mathrm{Ar}_{2} \mathrm{SiF}_{2}$ is the only isolable product when ArLi is reacted with $\mathrm{SiCl}_{4}$ in a $2: 1$ ratio. The formation of this difluoride compound is the result of a fluorine exchange reaction involving the $\mathrm{CF}_{3}$ groups of the fluoromes ligands.

Equation 1.4: Possible Mechanism for the formation of the difluoride derivative ${ }^{18}$ This $\mathrm{Cl} / \mathrm{F}$ halogen exchange also occurred in the reaction of trichlorosilane with ArLi: 19

$$
2 \mathrm{ArLi}+\mathrm{HSiCl}_{3} \xrightarrow[0^{\circ} \mathrm{C}]{\mathrm{Et}_{2} \mathrm{O}} \mathrm{Ar}_{2} \mathrm{SiHF}
$$

The first germanium derivative was synthesised by Bender et $a l^{20}$ as a Ge(II) compound: $\mathrm{Ar}_{2} \mathrm{Ge}$ formed by the reaction of ArLi with $\mathrm{GeCl}_{2}$.dioxane. To explore the issue of $\mathrm{M}-\mathrm{Ge}$ $\pi$ bonding, $\left[\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{NiGeAr}\right]^{20}$ has been synthesised. $\mathrm{Ar}_{2} \mathrm{GeH}_{2}{ }^{21}$ was also prepared. The reaction of ArLi with $\mathrm{GeCl}_{4}$ leads to Ge (IV) derivatives, $\mathrm{ArGeCl}_{3}$ and $\mathrm{Ar}_{2} \mathrm{GeCl}_{2} .22$

Tin derivatives have been more extensively studied. The reaction of ArLi with $\mathrm{SnCl}_{2}$ led to the formation of the first monomeric diarylstannylene $\mathrm{Ar}_{2} \mathrm{Sn} .{ }^{23}$ This compound is stabilised by intramolecular fluorine-tin contacts (Figure 1.2). $\mathrm{Ar}_{2} \mathrm{Sn}$ represents a useful starting material for the preparation of novel tin(IV) derivatives containing the Ar ligand. ${ }^{24,25}$

The reaction of $\mathrm{Ar}_{2} \mathrm{Sn}$ with PhSnSnPh or $\mathrm{Ag}\left(\mathrm{O}_{2} \mathrm{CCF}_{3}\right)$ gives rise to $\mathrm{Ar}_{2} \mathrm{Sn}(\mathrm{SnPh})_{2}$ and $\mathrm{Ar}_{2} \mathrm{Sn}\left(\mathrm{O}_{2} \mathrm{CCF}_{3}\right)_{2}$ respectively.

Figure 1.2: Intramolecular Sn---F interactions ${ }^{26}$

Some dimeric species have been isolated. Oxidation of $\mathrm{Ar}_{2} \mathrm{Sn}$ in the presence of $\mathrm{Cl}^{-}$led to the formation of the $\mu_{2}$-oxo bridged dimeric tin(IV) species $\operatorname{Ar}_{2}(\mathrm{Cl}) \operatorname{Sn}\left(\mu_{2}-\mathrm{O}\right) \operatorname{Sn}(\mathrm{Cl}) \mathrm{Ar}_{2} .27$ One crystal modification of $\mathrm{Ar}_{2} \mathrm{Sn}$ consists of the dimeric compound $\mathrm{Ar}_{2} \mathrm{Sn}-\mathrm{SnAr}_{2}$ (as found for In and Ga ) that shows a very weak tin-tin interaction. $\mathrm{Ar}_{2} \mathrm{Sn}$ is a useful precursor for cycloaddition reactions leading to three-, four-, or five- membered tin-
containing rings systems. ${ }^{28}$ Figure 1.3 below summarizes a series of heterocycles, which can be formed:

(h)

1

(a)

Reagents: (a) $\mathrm{t}-\mathrm{Bu}_{2} \mathrm{C}=\mathrm{C}=\mathrm{O}$, (b) $\mathrm{Ph}_{2} \mathrm{C}=\mathrm{C}=\mathrm{O}$, (c) $\mathrm{Me}_{2} \mathrm{C}=\mathrm{C}=\mathrm{NPh}$, (d) $\mathrm{Ph}_{2} \mathrm{C}=\mathrm{C}=\mathrm{NC}_{6} \mathrm{H}_{4} \mathrm{Me}-p$, (e) t-
$\mathrm{Bu}_{2} \mathrm{C}=\mathrm{C}=\mathrm{S}$, (f) $\mathrm{Me}_{3} \mathrm{SiN}=\mathrm{S}=\mathrm{NSiMe}_{3}$, (g) 3,5-di-t-butyl-o-benzoquinone, (h) $\mathrm{S}_{4} \mathrm{~N}_{4}$

Figure 1.3: Formation of heterocycles from $\mathrm{Ar}_{2} \mathrm{Sn}$
$\mathrm{Ar}_{2} \mathrm{Sn}$ readily undergoes oxidation reactions to afford the corresponding $\mathrm{Sn}(\mathrm{IV})$ species. For example, treatment of $\mathrm{Ar}_{2} \mathrm{Sn}$ with $\mathrm{AsF}_{5}$ yields $\mathrm{Ar}_{2} \mathrm{SnF}_{2} .25$ In addition, fluorination of $\mathrm{Ar}_{2} \mathrm{Sn}$ using $\mathrm{XeF}_{2}$ also provides $\mathrm{Ar}_{2} \mathrm{SnF}_{2} . \mathrm{Ar}_{2} \mathrm{SnCl}_{2}$ can be prepared by chlorinating $\mathrm{Ar}_{2} \mathrm{Sn}$ with elemental chlorine.

$$
\begin{aligned}
& \mathrm{Ar}_{2} \mathrm{Sn} \xrightarrow{\mathrm{AsF}_{2} \text { or } \mathrm{XeF}_{2}} \mathrm{Ar}_{2} \mathrm{SnF}_{2} \\
& \mathrm{Ar}_{2} \mathrm{Sn} \xrightarrow{\mathrm{Cl}_{2}} \mathrm{Ar}_{2} \mathrm{SnCl}_{2}
\end{aligned}
$$

$\mathrm{Tin}(\mathrm{IV})$ derivatives can also easily be prepared by reacting ArLi directly with $\mathrm{SnCl}_{4}: 22$

Equation 1.5:Synthesis of $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$

The steric properties of Ar also allowed the preparation of the first diarylplumbylene by the reaction of ArLi with $\mathrm{PbCl}_{2} .29$

Equation 1.6: Synthesis of $\mathrm{Ar}_{2} \mathrm{~Pb}$

This compound is far less reactive than its tin homologue $\mathrm{Ar}_{2} \mathrm{Sn}: 23,30,31 \mathrm{Ar}_{2} \mathrm{~Pb}$ does not undergo reaction leading to organolead(IV) compounds. The only other lead derivatives containing the Ar ligand reported are the plumbylene $\left(\mathrm{SiMe}_{3}\right) \mathrm{ArPb}=\mathrm{PbAr}\left(\mathrm{SiMe}_{3}\right)^{32}$ and a thiolate cluster $\mathrm{Pb}_{5} \mathrm{O}(\mathrm{SAr})_{8} .2 \mathrm{C}_{7} \mathrm{H}_{8} .33$

## - Group 15 derivatives

The 2,4,6-tris(trifluoromethyl)phenylamino ligand has shown a great ability to stabilise group 15 compounds as well as transition metal derivatives. 2,4,6tris(trifluoromethyl)phenylamine reacts with KH to give ArNHK. The latter can react with main group element halides such as $\mathrm{PCl}_{3}$ or $\mathrm{AsCl}_{3}$, leading to the formation of a dimer. ${ }^{34}$

## Equation 1.7: Formation of dimer

Recently, Roesky et al described the preparation of 2,4,6tris(trifluoromethyl)phenylamine in a four-step synthesis. ${ }^{35}$ The phenylamine ligand can then be used in various reactions to form monosilylated and bisilylated amines.

Phosphorus derivatives containing the fluoromes substituent constitute a fairly large and well-investigated class of compounds. Treatment of ArLi with the appropriate amount of
phosphorus trichloride leads to the formation of the mono- or di-substituted compounds, $\mathrm{ArPCl}_{2}$ or $\mathrm{Ar}_{2} \mathrm{PCl}$. 8,11

Equation 1.8: Synthesis of $\mathrm{ArPCl}_{2} / \mathrm{Ar}_{2} \mathrm{PCl}$

The dichlorophosphane $\mathrm{ArPCl}_{2}$ is easily reduced by $\mathrm{LiAlH}_{4}{ }^{8}$ or $\mathrm{Bu}_{3} \mathrm{SnH}^{12,36}$ to give the primary phosphane $\mathrm{ArPH}_{2}$. The action of $\mathrm{SbF}_{3}$ on $\mathrm{ArPCl}_{2}$ leads to the formation of $\mathrm{ArPF}_{2}$. $\operatorname{ArP}(\mathrm{CN})_{2}$ is obtained by cyanide substitution of chloride. $\mathrm{Ar}_{2} \mathrm{PH}$ was obtained by reduction of $\mathrm{Ar}_{2} \mathrm{PCl}$. However, the fluorination of the di-substituted product with $\mathrm{SbF}_{3}$ only led to a very small amount of $\mathrm{Ar}_{2} \mathrm{PF}$ ( $5 \%$ conversion). ${ }^{37}$ Steric hindrance around the $\mathrm{P}-\mathrm{Cl}$ bond makes substitution reactions ( $\mathrm{S}_{\mathrm{N}} 1$ or $\mathrm{S}_{\mathrm{N}} 2$ ) difficult.

$$
\begin{aligned}
& \mathrm{ArPCl}_{2}+2 \mathrm{Bu}_{3} \mathrm{SnH} \longrightarrow \mathrm{ArPH}_{2}+2 \mathrm{Bu}_{3} \mathrm{SnCl} \\
& \mathrm{ArPCl}_{2}+1 / 2 \mathrm{LiAlH}_{4} \longrightarrow \mathrm{ArPH}_{2}+1 / 2 \mathrm{LiAlCl}_{4} \\
& \mathrm{ArPCl}_{2}+\mathrm{SbF}_{3} \longrightarrow \mathrm{ArPF}_{2}+\mathrm{SbCl}_{2} \mathrm{~F} \\
& \mathrm{ArPCl}_{2}+2 \mathrm{AgCN} \longrightarrow \mathrm{ArP}(\mathrm{CN})_{2}+2 \mathrm{AgCl}
\end{aligned}
$$

$\mathrm{Ar}_{2} \mathrm{PH}$ was used as a starting material to synthesise the first phosphonium phosphide $\left(\mathrm{Ph}_{3} \mathrm{PMe}\right)^{+}\left(\mathrm{Ar}_{2} \mathrm{P}\right)^{-}: 38$

$\mathrm{ArPCl}_{2}$ appears to be a good precursor to form phosphorus compounds containing the Ar ligand. ${ }^{39}$

$$
\mathrm{Li}\left(\mathrm{C}_{5} \mathrm{Me}_{5}\right)+\mathrm{ArPCl}_{2} \longrightarrow \mathrm{C}_{5} \mathrm{Me}_{5} \mathrm{P}(\mathrm{Cl}) \mathrm{Ar}+\mathrm{LiCl}
$$

The fluoromes ligand has also allowed the formation of multiple bonded compounds. The condensation of $\mathrm{ArPCl}_{2}$ with $\mathrm{ArPH}_{2}$ has led to the first diphosphene containing the Ar ligand. ${ }^{8,11}$ This compound has shown an unusual stability. The chemistry of diphosphenes will be more extensively described later in this chapter (section 1.2). In addition, Dillon and co-workers ${ }^{40}$ first reported the preparation of phosphaalkenes containing the Ar group on phosphorus.

$$
\mathrm{CHLiCl}_{2}+\mathrm{ArPCl}_{2} \longrightarrow \mathrm{ArP}\left(\mathrm{CHCl}_{2}\right) \mathrm{Cl} \xrightarrow{\mathrm{DBU}} \mathrm{ArP}=\mathrm{CCl}_{2}
$$

Much less is known about fluoromes derivatives of the heavier group 15 elements. A 1:1 ratio reaction between ArLi and $\mathrm{AsCl}_{3}$ was attempted and resulted in the formation of the di-substituted product $\mathrm{Ar}_{2} \mathrm{AsCl}, 41$ whose crystal structure was reported very recently by Burford et al. ${ }^{42}$ The synthesis of the dichloroarsane $\mathrm{ArAsCl}_{2}$ was first described by Roesky and co-workers, ${ }^{43}$ and more recently by Xue. ${ }^{22}$

Equation 1.9: Synthesis of $\mathrm{ArAsCl}_{2} / \mathrm{Ar}_{2} \mathrm{AsCl}$

ArLi readily reacts with $\mathrm{AsF}_{3}$ to give the disubstituted product $\mathrm{Ar}_{2} \mathrm{AsF}$. $\mathrm{LiAlH}_{4}$ reduction of $\mathrm{Ar}_{2} \mathrm{AsF}$ produces the secondary arsine $\mathrm{Ar}_{2} \mathrm{AsH} .{ }^{25}$ Treatment of $\mathrm{ArAsCl}_{2}$ with potassium 2,4,6-tris(trifluoromethyl)anilide led to the formation of the first iminoarsane. 43

Antimony trichloride reacts with ArLi in a $1: 1$ or $1: 2$ ratio to give $\mathrm{ArSbCl}_{2}$ or $\mathrm{Ar}_{2} \mathrm{SbCl}$ respectively. ${ }^{11,18}$ The reaction of $\mathrm{Ar}_{2} \mathrm{SbCl}$ with $\mathrm{AgOSO}_{2} \mathrm{CF}_{3}$ afforded crystals of $\mathrm{Ar}_{2} \mathrm{Sb}\left(\mathrm{OSO}_{2} \mathrm{CF}_{3}\right) .42$
Only two well-characterised bismuth derivatives are known: $\mathrm{Ar}_{2} \mathrm{BiCl}$ and $\mathrm{Ar}_{3} \mathrm{Bi}^{44}$ The latter was the first example of a group 15 atom accommodating three bulky Ar ligands.

$$
\begin{aligned}
& 3 \mathrm{ArLi}+2 \mathrm{SbCl}_{3} \xrightarrow[0^{\circ} \mathrm{C}]{\mathrm{Et}_{2} \mathrm{O}} \mathrm{ArSbCl}_{2}+\mathrm{Ar}_{2} \mathrm{SbCl} \\
& 5 \mathrm{ArLi}+2 \mathrm{BiCl}_{3} \xrightarrow{\mathrm{Et}_{2} \mathrm{O}} \mathrm{Ar}_{2} \mathrm{BiCl}+\mathrm{Ar}_{3} \mathrm{Bi}
\end{aligned}
$$

## - Group 16 derivatives

The chemistry of fluoromes with this group of elements has been focused on ArOH and ArSH, which have been found to be highly valuable precursors for a number of unusual Ar derivatives.

ArOH is prepared by reacting ArLi with $\mathrm{Me}_{3} \mathrm{SiOOSiMe}_{3}: 45$

## Equation 1.10: Synthesis of ArOH

The phenol served as a starting material for a variety of main group and transition metal phenoxides.

Alkali metal phenoxides can be prepared by direct reaction of ArOH with $\mathrm{n}-\mathrm{BuLi}$ or NaH to give LiOAr. $\mathrm{Et}_{2} \mathrm{O}$ and NaOAr .THF respectively. ArOH can also react with $\mathrm{MN}\left(\mathrm{SiMe}_{3}\right)_{2} \quad(\mathrm{M}=\mathrm{Li}, \mathrm{Na}, \mathrm{K})$, leading to the formation of $\left[\mathrm{MOAr}(\mathrm{THF})_{\mathrm{x}}\right]_{2} .46,47$ Bis(phenoxides) have also been isolated as their THF adducts.(ArO) ${ }_{2} \mathrm{M}$ (THF) $\mathrm{x}(\mathrm{x}=1, \mathrm{M}$ $=\mathrm{Ba}, \mathrm{Be}, \mathrm{Sn} ; \mathrm{x}=2, \mathrm{M}=\mathrm{Cd}, \mathrm{x}=3, \mathrm{M}=\mathrm{Mg}, \mathrm{Ca}, \mathrm{Mn}) .{ }^{46}$ Edelmann et al ${ }^{45}$ were first to describe the preparation of the ArO- ligand. Like Ar, the ArO- ligand has been found to stabilise low-coordination numbers around metal atoms: for example $\mathrm{Tl}(\mathrm{I})$ and $\operatorname{In}(\mathrm{I})$ derivatives. 48

## Equation 1.11: Synthesis of $(\mathrm{ArOTl})_{2}$ and (ArOIn) ${ }_{2}$

These compounds represent the first structurally characterised examples of twocoordination at thallium and indium.

A C-F bond activation has been noticed in an attempted synthesis of ( ArO$)_{3} \mathrm{Bi}$ by reaction of $\mathrm{BiCl}_{3}$ with NaOAr in THF. Instead, this led to the formation of a highly crowded condensation product arising from the coupling of the ArO units with elimination of three ortho-fluorine atoms (Equation 1.12). 44

$$
\mathrm{BiCl}_{3}+3 / 2\left[\mathrm{NaOAr} .(\mathrm{THF})_{2}\right] \quad \longrightarrow \quad 6 \mathrm{THF}+6 \mathrm{NaCl}+\mathrm{Bi}(\mathrm{OAr})_{3}
$$

Equation 1.12: Attempted synthesis of $(\mathrm{ArO})_{3} \mathrm{Bi}$

2,4,6-tris(trifluoromethyl)phenol can also react with the lanthanide compounds $\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)_{3} \mathrm{Ln}$ $(\mathrm{Ln}=\mathrm{Nd}, \mathrm{Sm}, \mathrm{Yb})$ to give the mononuclear bis(cyclopentadienyl)lanthanide alkoxides $\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)_{2} \mathrm{Ln}$ (THF)(OAr). ${ }^{49}$

Another precursor is the thiol ArSH , which was first prepared by Chambers et al, ${ }^{7}$ by treatment of ArLi with elemental sulfur.

$$
\mathrm{ArLi}+\mathrm{S}_{8} \longrightarrow \mathrm{ArSH}
$$

Like ArOH , ArSH can be used to prepare various main group and transition metal derivatives. Two main routes are used to synthesise these compounds: 50

- metathesis reactions between NaSAr and metal halides
- protolysis of metal bis(trimethylsilyl)amides with ArSH.

For example:

| $\mathrm{ZnCl}_{2}+2 \mathrm{NaSAr}$ |  |  |
| :--- | :--- | :--- |
| $\mathrm{PbAr}_{2}+2 \mathrm{ArSH}$ | $\xrightarrow{\mathrm{Et}_{2} \mathrm{O}}$ | $\mathrm{Zn}(\mathrm{SAr})_{2}+2 \mathrm{NaCl}$ |
| $\mathrm{n}_{2}$ hexane |  |  |$\quad$| $\mathrm{Pb}(\mathrm{SAr})_{2}+2 \mathrm{ArH}$ |
| :--- |
| $\mathrm{PbCl}_{2}+2 \mathrm{NaSAr} \xrightarrow{\mathrm{Et}_{2} \mathrm{O}}$ |

$$
\mathrm{Mn}\left(\left(\mathrm{NSiMe}_{3}\right)_{2}\right)_{2} \cdot \mathrm{THF}+2 \mathrm{ArSH} \xrightarrow{\text { toluene }} \quad \mathrm{Mn}(\mathrm{SAr})_{2} \cdot \mathrm{THF}+2 \mathrm{HN}\left(\mathrm{SiMe}_{3}\right)_{2}
$$

Some thallium and indium derivatives have also been described. 51

Coordination of three fluoromes ligands has been observed in the indium derivative $(\mathrm{ArS})_{3} \operatorname{In}\left(\mathrm{Et}_{2} \mathrm{O}\right)$.

Like the phenol ligand, ArSH reacts with lanthanide compounds such as $\mathrm{Yb}\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)_{3}$ in THF to give $\left(\mathrm{C}_{5} \mathrm{H}_{5}\right)_{2} \mathrm{Yb}$ (thf)(SAr). ${ }^{25}$

Selenium also provides a rich field in fluoromes chemistry. Selenium may be inserted into ArLi to give the intermediate ArSeLi, which appears to be highly air-sensitive. Complete air-oxidation of ArSeLi leads to the formation of ArSe-SeAr. 52

$$
\begin{aligned}
\mathrm{ArLi}+1 / 8 \mathrm{Se}_{8} & \longrightarrow \mathrm{ArSeLi} \\
\mathrm{ArSeLi}+2 \mathrm{H}_{3} \mathrm{O}^{+}+1 / 2 \mathrm{O}_{2} & \longrightarrow\left[\mathrm{ArSe}_{2}+2 \mathrm{Li}^{+}+3 \mathrm{H}_{2} \mathrm{O}\right.
\end{aligned}
$$

[ ArSe$]_{2}$ is cleaved by $\mathrm{Cl}_{2}$ or $\mathrm{Br}_{2}$ to produce ArSeCl or ArSeBr respectively. These halogeno-compounds have served as starting materials to form new selenium-nitrogen bonds:

| $[\mathrm{ArSe}]_{2}+\mathrm{X}_{2}$ | 2 ArSeX | $(\mathrm{X}=\mathrm{Cl}, \mathrm{Br})$ |
| :---: | :---: | :---: |
| $2 \mathrm{ArSeX}+\left(\mathrm{Me}_{3} \mathrm{SiN}\right)_{2} \mathrm{~S}$ | $[\mathrm{ArSeN}$ | $\mathrm{SiMe}_{3}$ |
| ArSeX $+\mathrm{Me}_{3} \mathrm{SiNSO}$ | ArSeNS | $\mathrm{SiMe}_{3}$ |

The discovery of the stable selenol ArSeH allowed the formation of various main group and transition metal selenolate derivatives containing the ArSe moiety. The synthetic method involves the reaction of metal bis(trimethylsilyl)amides with appropriate amounts of $\operatorname{ArSeH}(\mathrm{M}=\mathrm{Mn}, \mathrm{Zn}, \mathrm{Cd}, \mathrm{Hg}, \mathrm{Ge}, \mathrm{Sn}, \mathrm{Pb}): 50$

$$
\mathrm{M}\left[\mathrm{~N}\left(\mathrm{SiMe}_{3}\right)_{2}\right]_{2}+2 \mathrm{ArSeH} \longrightarrow \mathrm{M}\left(\mathrm{SeAr}_{2}+2 \mathrm{HN}\left(\mathrm{SiMe}_{3}\right)_{2}\right.
$$

Indium, antimony and bismuth ArSe derivatives are prepared by reacting metal halides with the corresponding alkali metal selenophenolates:

$$
\mathrm{MCl}_{3}+3 \mathrm{NaSeAr} \longrightarrow \mathrm{M}(\mathrm{SeAr})_{3}+3 \mathrm{NaCl}
$$

Recently, Edelmann and co-workers 39 reported the synthesis of a tin(IV) complex $\mathrm{Sn}(\mathrm{SeAr})_{4}$. The latter was obtained by treatment of the tin(II) complex of bis[bis(trimethylsilyl)amide] with ArSeH

$$
2 \mathrm{Sn}\left[\mathrm{~N}\left(\mathrm{SiMe}_{3}\right)_{2}\right]_{2}+4 \mathrm{ArSeH} \longrightarrow \mathrm{Sn}(\mathrm{SeAr})_{4}+\mathrm{Sn}^{0}+4 \mathrm{HN}\left(\mathrm{SiMe}_{3}\right)_{2}
$$

Insertion reactions of carbenes and carbene fragments have been studied. ArSe-SeAr reacts with diazomethane to give rise to $\mathrm{ArSe}-\mathrm{CH}_{2}-\mathrm{SeAr}$. Complexes containing $\mathrm{Sm}-\mathrm{E}$ bonds $(\mathrm{E}=\mathrm{S}, \mathrm{Se}, \mathrm{Te})$ have also been synthesised by reaction of $[\mathrm{ArSe}]_{2}$ with $\mathrm{Cp}_{2}{ }^{*} \operatorname{Sm}(\mathrm{THF})_{2} .{ }^{53}$

## Equation 1.13: Synthesis of $\mathrm{ArSe}\left(\mathrm{Cp}_{2}{ }^{*} \mathrm{Sm}(T H F)\right)$

The chemistry of tellurium compounds is not well developed. ${ }^{25}$ It was found that ArLi does not react directly with elemental tellurium to form the corresponding ArTeLi. However, this intermediate is formed when $\mathrm{Bu}^{\mathrm{n}}{ }_{3} \mathrm{PTe}$ is used as a soluble tellurium source. ArTeLi is readily oxidised to form $[\mathrm{ArTe}]_{2}$. $[\mathrm{ArTe}]_{2}$ decomposes under the influence of heat or light to form $\mathrm{Ar}_{2} \mathrm{Te}: 39$

$$
\begin{aligned}
\mathrm{ArLi}+\mathrm{Bu}_{3} \mathrm{PTe} & \longrightarrow \mathrm{ArTeli}+\mathrm{Bu}_{3} \mathrm{P} \\
2 \mathrm{ArTeLi}+\mathrm{O}_{2} & \longrightarrow \mathrm{Ar}_{2} \mathrm{Te}_{2}+\mathrm{Li}_{2} \mathrm{O} \\
\mathrm{Te}_{2} \mathrm{Ar}_{2} & \longrightarrow \mathrm{Ar}_{2} \mathrm{Te}+\mathrm{Te}
\end{aligned}
$$

- Transition and other metal derivatives

The chemistry of transition metal containing $\sigma$-bonded fluoromes ligand remains an open field. Because of the possibility of short $\mathrm{M}---\mathrm{F}$ interactions involving the $o-\mathrm{CF}_{3}$ groups, the Ar ligand was thought to be an interesting ligand for transition metals. Several points of interest can arise with fluoromes ligand:

- crowding restricts rotation around M-C bonds;
- $\quad \mathrm{M}--\mathrm{F}$ interactions are frequently found in Ar complexes involving o- $\mathrm{CF}_{3}$;
- fluoromes should give a high degree of axial protection in a square planar configuration.

Initial studies have indicated that Ar is not likely to be a good ligand for early transition metals. Treatment of $\mathrm{NbCl}_{5}$ or $\mathrm{WCl}_{6}$ with various equivalents of ArLi did not produce any isolable compounds. ${ }^{25}$ The preparation of $\mathrm{ArReO}_{3}$ has been reported by reaction of $\mathrm{Ar}_{2} \mathrm{Zn}$ with $\mathrm{Re}_{2} \mathrm{O}_{7} .{ }^{25}$ More recently, Gibson and co-workers ${ }^{54}$ reported the synthesis of vanadium complexes obtained by treatment of ArLi with $\left[\mathrm{VCl}_{3}(\mathrm{thf})_{3}\right]$. Group 6 transition metal ( Cr or Mo ) complexes containing $\sigma$-bonded fluoromes ligand have also been described. 55,56 These compounds contain M---F secondary interactions, which play a significant role in stabilising the structures of Ar complexes of group 6 transition metals. These interactions seem to lengthen the C ipso- C ortho distances.

Figure 1.4: Interactions between the metal and the fluorine atoms

Some complexes containing group 9 and 10 elements have been reported: $\mathrm{Ar}_{2} \mathrm{Co}$, $\mathrm{Ar}_{2} \mathrm{Ni}^{57}$ and $\mathrm{Ar}_{2} \mathrm{Ni}\left(\mathrm{MeOCH}_{2} \mathrm{CH}_{2} \mathrm{OMe}\right) .58$ Variable temperature NMR studies of the latter Ni complex have shown that only two of the fluorines in $o-\mathrm{CF}_{3}$ groups interact with the Ni centre. Some palladium complexes have been prepared by treatment of ArLi with a variety of chloro complexes of palladium(II). ${ }^{59}$ The coordination of two bulky Ar groups on $\mathrm{Pd}(\mathrm{II})$ led to the formation of very crowded square planar complexes.

Few examples have been given with group 11 elements. A complex containing $\mathrm{Cu}(\mathrm{I})$ has been mentioned. Recently, Espinet et al reported the first Ar derivatives of $\mathrm{Au}(\mathrm{I})$ and $\mathrm{Au}(\mathrm{III}) .{ }^{60}$

$$
\mathrm{ArLi}+[\mathrm{AuCl}(\mathrm{tht})] \longrightarrow[\mathrm{AuAr}(\mathrm{tht})]
$$

$[\operatorname{AuAr}(t h t)]^{*}$ is a general precursor for various gold complexes. (tht) can easily be replaced by others ligands such as $\mathrm{PPh}_{3}$ or $\mathrm{P}(o \text {-tol })_{3}$.

2

Equation 1.14: Synthesis of $\mathrm{Ar}_{2} M(M=\mathrm{Zn}, \mathrm{Cd}, \mathrm{Hg})$

Significant results have been obtained with Ar derivatives of the group 12 elements. ArLi reacts with anhydrous $\mathrm{ZnCl}_{2}$ to give $\mathrm{Ar}_{2} \mathrm{Zn}$. ${ }^{61}$

The corresponding cadmium and mercury ${ }^{7}$ compounds were prepared analogously from cadmium diiodide or mercury dichloride. The two-coordinate monomeric structure of $\mathrm{Ar}_{2} \mathrm{Zn}$ represents a new structural type for zinc diaryls.

[^0]Using the Metal Vapour Synthesis method (MVS), Sequeira ${ }^{62}$ prepared a series of $\pi$-complexes containing 1,3,5-tris(trifluoromethyl)benzene as a ligand.: $\mathrm{M}\left(\eta^{6}-\mathrm{ArH}\right)_{2}$ with $\mathrm{M}=\mathrm{Cr}, \mathrm{V}, \mathrm{Nb}, \mathrm{Ru}$. The ArH ligand has demonstrated the ability to bind to metals in a $\eta^{6}$ arene fashion.

Equation 1.15: Synthesis of $M\left(\eta^{6}-A r H\right)_{2}$

- Conclusion

In most of the Ar main group element compounds, structural analyses have shown that the M-C bond distance is longer than in the mesityl analogues, reflecting the large steric demands of the Ar ligands. However, in some cases, this is also due to electrostatic ligand-ligand repulsions, which lead to a lengthening of the bond rather than a widening of angles.
M---F intramolecular interactions between the central atom and some of the fluorines of the ortho- $\mathrm{CF}_{3}$ groups are also responsible for the stabilisation of complexes containing the fluoromes ligand. The potential of forming weak M---F interactions means that the Ar group is capable of inhibiting oligomerisation, which is shown, for example, by its ability to stabilise a diaryl stannylene. ${ }^{28}$

### 1.1.3 1,3-bis(trifluoromethyl)benzene (FluoroxylH, Ar'H)

### 1.1.3.1 Properties

Fluoroxyl groups are quite similar to fluoromes. Instead of containing three $\mathrm{CF}_{3}$ groups, they only have two. This substituent can easily be bonded to main group elements via a lithiated product. Like fluoromes, fluoroxyl is strongly electron-withdrawing. This is particularly caused by the position of the $\mathrm{CF}_{3}$ groups, which can be both in the ortho, or one in the ortho and one in the para position. The boiling point of 1,3bis(trifluoromethyl)benzene is $116^{\circ} \mathrm{C}$

Figure 1.5: 1,3-bis(trifluoromethyl)benzene

### 1.1.3.2 Comparison between ArH and $\mathrm{Ar}^{\prime} \mathrm{H}$

Fluoromesityl and fluoroxyl are both bulky and strongly electron-withdrawing substituents, due to the presence of $\mathrm{CF}_{3}$ groups in the ortho position. The greatest differences between them are the number of bulky trifluoromethyl groups, and then the number of reaction sites. In fluoromesityl, there is only one reaction site available, resulting in two $\mathrm{CF}_{3}$ groups in ortho positions and one $\mathrm{CF}_{3}$ group in the para position (site A, Figure 1.6). Fluoroxyl has three different reaction sites (Figure 1.6):

- two $\mathrm{CF}_{3}$ groups in the ortho position (site B )
- one $\mathrm{CF}_{3}$ group in the ortho position and one in the para (site C )
- two $\mathrm{CF}_{3}$ groups in the meta position (site D )

Fluoromes

Fluoroxyl

Figure 1.6: Substitution sites in Fluoromes and Fluoroxyl

The reaction site D is the least likely site in the reaction with BuLi because of the absence of $\mathrm{CF}_{3}$ groups in the ortho position, which play an important role in the stabilisation of the molecule. D is also disfavoured because the activated sites for Li substitution are the positions ortho and para to $\mathrm{CF}_{3}$ groups.
Like ArH, Ar'H reacts easily with BuLi to form a lithiated compound. The lithiation of fluoromes leads to only one product. In fluoroxyl, due to the directional functionality of the $\mathrm{CF}_{3}$ groups, the ortho and para positions will become electron-deficient, and then the hydrogen atom will be susceptible to nucleopilic attack by the butyl group.

Ar'Li

Ar"Li

Figure 1.7: Probable lithiation sites for Fluoroxyl

With two ortho $-\mathrm{CF}_{3}$ groups in the Ar 'Li compound, the lithiated site is sterically hindered. An interaction between Li and some of the fluorine atoms is therefore probable. In the Ar "Li compound, one $\mathrm{CF}_{3}$ group only hinders the lithiated site and $\mathrm{Li}--\mathrm{F}$ interactions may thus be fewer than in Ar'Li. The reaction of a metal chloride $\mathrm{MX}_{3}$ (for a group 13 or 15 element) with lithiated compounds can lead to mono and di-substituted products. (Figure 1.8)

Figure 1.8: Different products of the reaction of $A^{\prime} L i / A r$ 'Li with $M X_{3}$

### 1.1.3.3 Reaction with heavier main group elements or transition metals

To date, little has been published about the $2,6-\left(\mathrm{CF}_{3}\right)_{2} \mathrm{C}_{6} \mathrm{H}_{3}$ group as a substituent, partly because of the complications in the chemistry of the precursor 1,3bis(trifluoromethyl)benzene, Ar'H. As explained earlier, this can lithiate in two positions, giving rise to a mixture of $2,6-\left(\mathrm{CF}_{3}\right)_{2} \mathrm{C}_{6} \mathrm{H}_{3}\left(\mathrm{Ar} \text { ') and 2,4-( } \mathrm{CF}_{3}\right)_{2} \mathrm{C}_{6} \mathrm{H}_{3}\left(\mathrm{Ar}{ }^{\prime \prime}\right)$ derivatives.

- Group 14 derivatives

Xue ${ }^{22}$ synthesised a series of Si and Ge derivatives, which are symmetrical molecules containing two $\mathrm{Ar} "$ moieties; $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{SiCl}_{2}$ and $\mathrm{Ar}_{2}{ }_{2} \mathrm{GeCl}_{2}$. They were prepared by reaction of the mixture $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ with $\mathrm{SiCl}_{4}$ or $\mathrm{GeCl}_{4}$ respectively and were characterised by elemental analyses, ${ }^{19}$ F NMR spectroscopy and single crystal X-Ray diffraction.

Equation 1.16: Synthesis of $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{MCl}_{2}$

Tin compounds were the first derivatives containing a fluoroxyl ligand reported. $\mathrm{Ar}^{\prime} \mathrm{SnMe}_{3}$ and $\mathrm{Ar}{ }^{\prime} \mathrm{SnMe}_{3}$ were prepared from $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ with $\mathrm{Me}_{3} \mathrm{SnCl}$. The lithiated mixture reacts with $\mathrm{SnCl}_{2}$ to give a $\operatorname{tin}$ (II) derivative $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{Sn} .63$

$$
2 \text { Ar'Li. TMED }+\mathrm{SnCl}_{2} \longrightarrow \mathrm{Ar}_{2} \mathrm{Sn}
$$

$\mathrm{Ar}^{\prime}{ }_{2} \mathrm{Sn}$ can be a precursor for the preparation of other tin derivatives containing a fluoroxyl ligand.

$$
\mathrm{Ar}_{2}^{\prime} \mathrm{Sn}+\mathrm{MeOH} \xrightarrow{\text { benzene }} \quad \mathrm{Ar} \text { 'Sn-OMe }+\mathrm{Ar}^{\prime} \mathrm{H}
$$

Xue ${ }^{22}$ synthesised some $\operatorname{tin}(I V)$ derivatives. Reaction of $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}^{\prime \prime} \mathrm{Li}$ with $\mathrm{SnCl}_{4}$ led to the formation of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$, which was characterised crystallographically.

## - Group 15 derivatives

The first chlorophosphine containing Ar' has been described by Escudié et al. ${ }^{36}$

Roden ${ }^{37}$ has prepared a series of phosphorus derivatives containing fluoroxyl. Treatment of the mixture $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}$ ' Li with an appropriate amount of $\mathrm{PCl}_{3}$ gave rise to a mixture of three different products: $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}, \mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ and the unsymmetrical disubstituted molecule Ar'Ar" ${ }^{\prime} \mathrm{PCl}$ (Figure1.9). ${ }^{64}$

$\mathbf{A r}^{\prime} \mathbf{P C l}_{2}$
Ar" $\mathbf{P C l}_{2}$

Ar'Ar" ${ }^{\prime}$ PCl

Figure 1.9: Different products of the reaction between $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ and $\mathrm{PCl}_{3}$

Ar ${ }^{\prime} \mathrm{PBr}_{2}$ and $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ can be prepared from $\mathrm{PBr}_{3}$. Reduction of the chloride compounds with $\mathrm{Bu}_{3} \mathrm{SnH}$ or $\mathrm{LiAlH}_{4}$ leads to the formation of the hydride derivatives. Fluorination with $\mathrm{SbF}_{3}$ affords the fluoride substituents.

Treatment of the $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime \prime} \mathrm{Li}$ mixture with $\mathrm{PF}_{2} \mathrm{Cl}$ yields $\mathrm{Ar}^{\prime \prime} \mathrm{PF}_{2}$ and $\mathrm{Ar}^{\prime}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{PF}$, the first disubstituted compounds containing fluoroxyl ligands described in the literature. 65 The ${ }^{19} \mathrm{~F}$ NMR spectra of $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PCl}$ or $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PF}$ showed a broad singlet for the two $\mathrm{CF}_{3}$ groups of the Ar' moiety, reflecting the inequivalence of the trifluoromethyl groups. Some multiple-bond compounds, such as $\mathrm{Ar}^{\prime} \mathrm{P}=\mathrm{PAr}$ ', have also been described; this compound has had its X-ray structure ascertained. ${ }^{66}$

Some preliminary work on the synthesis of arsenic derivatives has been attempted by Xue. ${ }^{22}$

No examples have been published with antimony or bismuth.

## - Transition metal derivatives

The only example of a transition metal complex containing the Ar' ligand is a chromacene. This compound contains the Ar' ligand in a sandwich complex with chromium. 67

### 1.2 Diphosphenes

Simple substituted diphosphene derivatives, $\mathrm{RP}=\mathrm{PR}$ ( $\mathrm{R}=\mathrm{Alkyl}$, aryl) are usually highly unstable. In 1981, Yoshifuji et al 68 reported the synthesis of the first stable diphosphene
(by reaction between $\mathrm{Ar}^{*} \mathrm{PCl}_{2}$ and Mg metal) containing a bulky electron-withdrawing substituent as a protecting group (2,4,6-tris-butylphenyl) (supermes or $\mathrm{Ar}^{*}$ ).

## Equation 1.17: Synthesis of $A r^{*} P=P A r^{*}$

Therefore, it has been thought that substituents like 2,4,6-tris(trifluoromethyl)phenyl or 2,6-bis(trifluoromethyl)phenyl could be good ligands to stabilise such species.

### 1.2.1 Fluoromes

### 1.2.1.1 Synthetic route

The first diphosphene containing the Ar ligand was obtained by reaction of $\mathrm{ArPCl}_{2}$ with $\mathrm{ArPH}_{2}$ in the presence of a base (DBU): $8,11,69$

Equation 1.18: Synthesis of $A r P=P A r$

This diphosphene can also be prepared via the Mg route, and via a reaction of dechlorination with a base, 1,3,1', $3^{\prime}$,-tetraethyl-2,2'-bis(imidazolidine). ${ }^{\prime}, 70$

Another synthetic route to the diphosphenes was discovered by Dillon, Gibson and Sequeira: ${ }^{71}$ transition metal-catalysed metathesis of double bonds. They used the highly reducing nature and labile coordination sphere of the zerovalent tungsten complex, $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$, as an efficient chloride ion abstractor. Dichlorophosphines react with $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ in benzene smoothly over several hours to give the diphosphene $\mathrm{RP}=\mathrm{PR}$ [R:2,4,6-tris-butylphenyl, 2,4,6-tris(trifluoromethyl)phenyl, 2,6tris(trifluoromethyl)phenyl]. The proposed mechanism is shown below (Equation 1.19).

Equation 1.19: Synthesis of $A r^{*} P=P A r^{*}$ with $W\left(P M e_{3}\right)_{6}$

### 1.2.1.2 Coordination chemistry

$\mathrm{ArP}=\mathrm{PAr}$ is surprisingly an air- and moisture stable solid at room temperature and binds less strongly to transition metals than its hydrocarbon analogues.

Several modes of coordination are possible with diphosphenes. They can coordinate to suitable acceptors either in a $\eta^{1}$-fashion, via a lone pair on phosphorus, or in a $\eta^{2}$-mode, via the $\pi$ system of the double bond, or by combination of these modes.

$\eta^{1}$

$\eta^{2}$

Figure 1.10: Coordination chemistry of diphosphene

Although the reactivity of $\mathrm{ArP}=\mathrm{PAr}$ is apparently low, the synthesis of a few stable carbonyl complexes have been mentioned: $(\mathrm{ArP}=\mathrm{PAr}) \mathrm{ML}_{\mathrm{n}}\left(\mathrm{ML}_{\mathrm{n}}=\mathrm{Fe}(\mathrm{CO})_{4}, \mathrm{Cr}(\mathrm{CO})_{5}\right.$, $\left.\mathrm{Mo}(\mathrm{CO})_{5}\right)^{25}$ Dillon and Goodwin reported the synthesis of $\mathrm{ArP}=\mathrm{PAr} \cdot \mathrm{Mo}(\mathrm{CO})_{5}$, $\operatorname{ArP}=\mathrm{PAr} . \mathrm{W}(\mathrm{CO})_{s}$, and of $c i s-\left[\mathrm{Pt}(\mathrm{ArP}=\mathrm{PAr})\left(\mathrm{PEt}_{3}\right) \mathrm{Cl}_{2}\right] .69$
The synthesis of the first complexes containing $\eta^{2}$-bonded $\mathrm{ArP}=\mathrm{PAr}$ has been described more recently. ${ }^{72}$
$\mathrm{ArPCl}_{2}$ served as the starting material for the synthesis of a number of interesting diphosphenyl metal complexes, ${ }^{73,74}$ such as $\mathrm{Cp}^{*}(\mathrm{CO})_{2} \mathrm{Fe}-\mathrm{P}=\mathrm{P}=$ Ar. Apparently, no attempts have been made to synthesise multiple-bonded compounds with heavier group 15 elements containing fluoromes such as ArAs=AsAr.

### 1.2.2 Fluoroxyl

The first diphosphene containing the $\mathrm{Ar}^{\prime}$ group ( $\mathrm{Ar}^{\prime} \mathrm{P}=\mathrm{PAr}$ ) was synthesised by Escudié et al. ${ }^{66}$ The behaviour of this compound was unexpected, and very different from that previously reported for other diphosphenes: such derivatives react with electrophiles, nucleophiles or transition metals. ${ }^{75}$ However, no addition reactions to the $\mathrm{P}=\mathrm{P}$ double bond of $\mathrm{Ar}^{\prime} \mathrm{P}=\mathrm{Ar} \mathrm{'}^{\mathrm{P}}$ have been observed.

## Chapter 2

## Group 13 Derivatives

In this work, we have been especially interested in the reactions between fluoromes or fluoroxyl compounds and boron trihalides. Attempts have also been made to prepare aluminium derivatives, but without success so far.

### 2.1 Introduction

There are three important methods to prepare alkyl (or aryl) boron dihalides or dialkyl (or diaryl) boron halides. 1,2

- Interaction of organometallic compounds with boron halides or substituted boron halides:

$$
\begin{aligned}
\mathrm{Zn}\left(\mathrm{C}_{6} \mathrm{H}_{5}\right)_{2}+\mathrm{BF}_{3} & \longrightarrow \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{ZnF}+\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{BF}_{2} \\
\mathrm{ArHgX}+\mathrm{BX}_{3} & \longrightarrow \mathrm{ArBX}_{2}+\mathrm{HgX}_{2} \\
\mathrm{Al}(\mathrm{Me})_{3}+3 \mathrm{BBr}_{3} & \longrightarrow 3 \mathrm{MeBBr}_{2}+\mathrm{AlBr}_{3} \\
\mathrm{Me}_{3} \mathrm{SnC}_{6} \mathrm{~F}_{5}+2 \mathrm{BCl}_{3} & \longrightarrow \mathrm{Me}_{2} \mathrm{SnCl}_{2}+\mathrm{MeBCl}_{2}+\mathrm{C}_{6} \mathrm{~F}_{5} \mathrm{BCl}_{2}
\end{aligned}
$$

- Reaction of triarylborons or aminodialkyl borons with a halogenating agent:

$$
\mathrm{B}\left(\mathrm{Bu}_{3}\right)+\mathrm{HBr} \xrightarrow{-\mathrm{BuH}} \mathrm{Bu}_{2} \mathrm{BBr}
$$

- Reaction of trimethyl boroxine with boron halides:

$$
(\mathrm{MeBO})_{3}+2 \mathrm{BF}_{3} \longrightarrow 3 \mathrm{MeBF}_{2}+\mathrm{B}_{2} \mathrm{O}_{3}
$$

## - Arylhalogenoboranes

The chemistry of arylhalogenoboranes $\mathrm{ArBX}_{2}(\mathrm{X}=\mathrm{F}, \mathrm{Cl}, \mathrm{Br}, \mathrm{I})$ is well-established. However, there are few communications concerning fluoro-containing aryldifluoroboranes ${ }^{3,4}$. Recently, Frohn et al ${ }^{5}$, reported the preparation and NMR studies of some fluoroaryldifluoroboranes. The possible routes for the preparation of $\mathrm{C}_{6} \mathrm{~F}_{5} \mathrm{BCl}_{2}$ or $\mathrm{C}_{6} \mathrm{~F}_{5} \mathrm{BF}_{2}$ are as follow:

$$
\begin{aligned}
& \mathrm{C}_{6} \mathrm{~F}_{5} \mathrm{HgEt}+\mathrm{BCl}_{3} \longrightarrow \mathrm{C}_{6} \mathrm{~F}_{5} \mathrm{BCl}_{2}+\mathrm{EtHgCl} \\
& \mathrm{C}_{6} \mathrm{~F}_{5} \mathrm{BCl}_{2}+2 \mathrm{HF} \longrightarrow \mathrm{C}_{6} \mathrm{~F}_{5} \mathrm{BF}_{2}+2 \mathrm{HCl}
\end{aligned}
$$

In the last decades, few examples have been published of boron compounds containing bulky and/or electron-withdrawing ligands such as mesityl ${ }^{6}$ or very recently fluoromesityl. ${ }^{7}$

Boron trihalides $\left(\mathrm{BX}_{3}\right)$ can undergo rapid scrambling or redistribution reactions on being mixed, with formation of mixed halides $\mathrm{BX}_{2} \mathrm{Y}$ and $\mathrm{BXY}_{2}$. The related systems $\mathrm{RBX}_{2} / \mathrm{R}^{\prime} \mathrm{BY}_{2}$ (and $\mathrm{ArBX}_{2} / \mathrm{Ar}^{\prime} \mathrm{BY}_{2}$ ) also exchange X and Y but not R or $\mathrm{Ar}^{8}{ }^{8}$ Goodwin ${ }^{9}$ has also observed some fluorine/chlorine exchange in the reaction of $\mathrm{BCl}_{3}$ with ArLi .

- Triarylboranes

The chemistry and particularly the conformation of triarylboranes have been studied; ${ }^{10,11}$ their main features are the propeller-shaped conformations, and stereodynamics via the flip of aryl rings. The interest was to investigate the effect of bulky substituents such as mesityl or naphthyl groups on the conformation. More recently, Goodwin ${ }^{9}$ synthesised $\mathrm{Ar}_{3} \mathrm{~B}$ (Ar: 2,4,6-tris(trifluoromethyl)phenyl) but no structure has been determined so far for this compound. Additionally, the structure of tris-[3,5-bis(trifluoromethyl)phenyl]borane has been briefly mentioned, 12 and structural
and dynamic NMR studies of tris[2-(trifluoromethyl)phenyl]borane have been carried out. ${ }^{13}$

Usually, in organoborane compounds the carbon link has a largely single $\sigma \mathrm{B}-\mathrm{C}$ bond. Tri-coordinate organoboranes have a trigonal planar structure, with the potential for back bonding to the empty boron orbital from adjacent groups containing an unshared electron pair or a conjugated $\pi$-bond. ${ }^{14}$

### 2.2 Reaction with 2,4,6-tris(trifluoromethyl)phenyl lithium (ArLi)

This reaction was carried out following the method of Goodwin. ${ }^{9}$ ArLi was added slowly to a $\mathrm{BCl}_{3} . \mathrm{Et}_{2} \mathrm{O}$ solution at room temperature. The ${ }^{19} \mathrm{~F}$ NMR spectra showed a number of peaks, including a doublet at $-57.3 \mathrm{ppm}\left({ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 14.3 \mathrm{~Hz}\right)$ suggesting the presence of $\mathrm{Ar}_{2} \mathrm{BF}$. The ${ }^{11}$ B NMR yielded signals at 45.1 and 26.0 ppm . ArLi was then added gradually into the solution, and ${ }^{19} \mathrm{~F}$ and ${ }^{11} \mathrm{~B}$ NMR spectra were recorded after each addition. The reaction was carried out until no further changes were observed in the NMR spectra. The final spectra exhibit the presence of a mixture of four different species: $\mathrm{ArBCl}_{2}, \mathrm{ArBF}_{2}$, $\mathrm{Ar}_{2} \mathrm{BF}$ and $\mathrm{Ar}_{3} \mathrm{~B}$. NMR data are listed in Table 2.1. $\mathrm{ArBF}_{2}$ and $\mathrm{Ar}_{3} \mathrm{~B}$ could not be isolated, although $\mathrm{ArBCl}_{2}$ was isolated by distillation under vacuum $\left(\mathrm{Bp} 60^{\circ} \mathrm{C}\right)$ as a yellow oil and $\mathrm{Ar}_{2} \mathrm{BF}$ as a white solid. In addition, some typical boron halide species were observed in solution ( $\mathrm{BFCl}_{2} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{BF}_{2} \mathrm{Cl}^{2} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ ) (Table 2.2), confirming that halogen exchange had occurred. These values agree with the shifts found by Goodwin. ${ }^{9}$

|  | $\delta{ }^{19} \mathrm{~F}(\mathrm{ppm})$ | $\delta^{11} \mathrm{~B}(\mathrm{ppm})$ |
| :---: | :---: | :---: |

| $\mathrm{BCl}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ | $-114.3\left(\mathrm{q},{ }^{1} \mathrm{~J}_{\mathrm{B}-\mathrm{F}} 57.6 \mathrm{~Hz}\right)$ | $7.9\left(\mathrm{~d},{ }^{1} \mathrm{~J}_{\mathrm{B}-\mathrm{F}} 58.1 \mathrm{~Hz}\right)$ |
|  |  | 10.7 |

Table 2.2: $N M R$ Data for $\mathrm{BF}_{n} \mathrm{Cl}_{3-n}$. $\mathrm{Et}_{2} \mathrm{O}$ adducts ( $3 \leq n \leq 0$ ).

[^1]The signal at -57.3 ppm was confirmed as a doublet by recording the spectra were at different frequencies ( 188.16 and 376.35 MHz ). This conclusion disagrees with the statements made by Goodwin ${ }^{9}$ and Gibson et al, ${ }^{15}$ where these signals were assigned to two different singlets for the $o-\mathrm{CF}_{3}$ groups, due to non-equivalence of the aryl rings.
The presence of $\mathrm{ArBF}_{2}$ and $\mathrm{Ar}_{2} \mathrm{BF}$ can be explained by a chlorine/fluorine exchange while the reaction is taking place. The only sources of fluorine atoms in the solution are the $\mathrm{CF}_{3}$ groups in the ArLi compound. The mechanism proposed for this exchange could be as shown below:

Equation 1.1: Proposed mechanism for the fluorine/chlorine exchange.

In order to identify the different species arising from the $\mathrm{F} / \mathrm{Cl}$ exchange, a reaction between $\mathrm{BCl}_{3} . \mathrm{Et}_{2} \mathrm{O}$ and $\mathrm{BF}_{3} . \mathrm{Et}_{2} \mathrm{O}$ was carried out. ${ }^{19} \mathrm{~F}$ and ${ }^{11} \mathrm{~B}$ NMR spectra show the presence of $\mathrm{BCl}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{BF}_{2} \mathrm{Cl}^{2} \cdot \mathrm{Et}_{2} \mathrm{O}$ and $\mathrm{BFCl}_{2} \cdot \mathrm{Et}_{2} \mathrm{O}$. NMR data are listed in Table 2.2.

- X-ray structure of $\mathrm{Ar}_{2} \mathrm{BF}$ :
$\mathrm{Ar}_{2} \mathrm{BF}$ was isolated as a white solid which was purified by recrystallisation from dichloromethane. Crystals were submitted for X-ray diffraction. The structure was determined at 120 K by A.L. Thompson and is shown in Figure 2.1.

Figure 2.1: Molecular structure of $A r_{2} B F$
$\mathrm{Ar}_{2} \mathrm{BF}$ crystallises in the monoclinic space group $\mathrm{P} 21 / \mathrm{n}$ with $\mathrm{Z}=4$. Selected bond distances and angles are listed in Table 2.3 below:

| Bond distance $(\AA)$ |  | Angles $\left(^{\circ}\right)$ |  |
| :---: | :---: | :---: | :---: |
| $\mathrm{B}(1)-\mathrm{C}(21)$ | $1.588(4)$ | $\mathrm{F}(1)-\mathrm{B}(1)-\mathrm{C}(10)$ | $115.2(2)$ |
| $\mathrm{B}(1)-\mathrm{C}(11)$ | $1.594(4)$ | $\mathrm{F}(1)-\mathrm{B}(1)-\mathrm{C}(21)$ | $116.0(2)$ |
| $\mathrm{B}(1)-\mathrm{F}(1)$ | $1.313(3)$ |  |  |
| $\mathrm{B}(1)-\mathrm{F}(13)$ | 2.763 | $\mathrm{C}(21)-\mathrm{B}(1)-\mathrm{C}(11)$ | $128.5(2)$ |
| $\mathrm{B}(1)-\mathrm{F}(19)$ | 2.792 |  |  |

| $\mathrm{~F}(1)-\mathrm{F}(29)$ | 2.711 |  |  |

Table 2.3: Selected Bond Distances and Angles for $A r_{2} B F$

The $\mathrm{B}(1)-\mathrm{C}$ distances are $1.588(4)$ and $1.594(4) \AA$. Angles $\mathrm{F}(1)-\mathrm{B}(1)-\mathrm{C}(10)$ and $\mathrm{F}(1)-\mathrm{B}(1)-\mathrm{C}(21)$ are $115.2(2)$ and $116.0(2)^{\circ}$ respectively. The two para-trifluoromethyl groups appear to be disordered, as often observed in compounds containing these substituents, for example $\mathrm{Ar}_{2} \mathrm{AsCl}, \mathrm{Ar}_{2} \mathrm{SbCl},{ }^{16} \mathrm{Ar}_{2} \mathrm{BiCl}$ and $\mathrm{Ar}_{3} \mathrm{Bi}^{1}{ }^{17}$

The B-C distances are slightly shorter than those found in $\mathrm{Ar}_{2} \mathrm{BN}_{3}$ (1.62 $\AA$ ) and $\mathrm{Ar}_{2} \mathrm{~B}(\mathrm{OH})(1.60 \AA)^{7}$ the only structures containing B and Ar published so far. The C-B-C angle in $2,6-\left(\mathrm{F}_{2} \mathrm{C}_{6} \mathrm{H}_{3}\right)_{2} \mathrm{BCl}$ is $123.1(2)^{\circ},{ }^{7}$ compared with $128.5(2)^{\circ}$ for $\mathrm{Ar}_{2} \mathrm{BF}$. The latter is bigger due to the presence of the bulky $\mathrm{CF}_{3}$ substituents in the ortho position.

Four short contacts between B---F are observed, for $F(13), F(19), F(23)$ and $F(28)$ (Table 2.3) at an average interatomic distance of ca. $2.78 \AA$. This value is shorter than the sum of van der Waals radii of $B$ (ca. $2.08 \AA$ ) and F (ca. $1.40 \AA$ ). 18 Moreover, some of the $F(1)$-F distances are found to be shorter than others, reflecting possible F---F interactions between some of the fluorines of the trifluoromethyl groups and the fluorine atom directly bonded to the central boron atom (Table 2.3 ).

### 2.3 Reaction with a 2,6-bis(trifluoromethyl)phenyl lithium / 2,4bis(trifluoromethyl)phenyl lithium mixture (Ar'Li/Ar"Li)

A solution of $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}^{\prime \prime} \mathrm{Li}^{*}$ was added to a $\mathrm{BCl}_{3}$ solution in diethyl ether. The ${ }^{19} \mathrm{~F}$ and ${ }^{11} \mathrm{~B}$ NMR spectra indicated different species in solution ( $\mathrm{Ar}^{\prime} \mathrm{BCl}_{2}, \mathrm{Ar}^{\prime}{ }_{2} \mathrm{BF}, \mathrm{Ar}{ }_{3} \mathrm{~B}$ ), and some species arising from direct fluorine/chlorine exchange $\left(\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{BFCl}_{2} \cdot \mathrm{Et}_{2} \mathrm{O}\right.$, $\mathrm{BF}_{2} \mathrm{Cl}^{2} \mathrm{Et}_{2} \mathrm{O}$ ), for which data are listed in Table 2.2. Compounds were separated by distillation under reduced pressure ( 0.05 Torr).

- $\mathrm{Ar}^{\prime} \mathrm{BCl}_{2}$

Equation 2.2: Synthesis of $\mathrm{Ar}^{\prime} \mathrm{BCl}_{2}$

This fraction was collected at $48^{\circ} \mathrm{C}$ as a yellow oil. The ${ }^{19} \mathrm{~F}$ NMR spectrum showed a singlet at -56.8 ppm corresponding to two ortho $-\mathrm{CF}_{3}$ groups. The ${ }^{11} \mathrm{~B}$ NMR consisted of one singlet at 57.5 ppm .

- $\mathrm{Ar}{ }_{2}{ }_{2} \mathrm{BF}$

Equation 2.3: Synthesis of $A r{ }^{\prime \prime}{ }_{2} B F$

[^2]The ${ }^{19} \mathrm{~F}$ NMR spectrum of the fraction collected at $92^{\circ} \mathrm{C}$ showed a doublet at $-57.2\left({ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}}\right.$ $14.7 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), a singlet at $-63.3\left(6 \mathrm{~F}, p-\mathrm{CF}_{3}\right)$, and a multiplet at $-86.6 \mathrm{ppm}(1 \mathrm{~F}, \mathrm{~B}-$ F). The ${ }^{11} \mathrm{~B}$ NMR exhibited a broad singlet at 47.8 ppm .

- $\mathrm{Ar}^{\prime}{ }_{3} \mathrm{~B}$

Equation 2.4: Synthesis of $A r{ }^{\prime}{ }_{3} B$

After distillation, a white solid remained in the flask. This was washed three times with hexanes and dried under vacuum. The ${ }^{19} \mathrm{~F}$ NMR spectrum consisted of a singlet at -56.6 ( $9 \mathrm{~F}, o-\mathrm{CF}_{3}$ ) and a singlet at -63.8 ( $9 \mathrm{~F}, p-\mathrm{CF}_{3}$ ) ppm.
In order to investigate the rotation of the ring around the boron atom, ${ }^{19} \mathrm{~F}$ NMR spectra of $\mathrm{Ar}{ }_{3}{ }_{3} \mathrm{~B}$ were recorded between $10^{\circ} \mathrm{C}$ and $-80^{\circ} \mathrm{C}$. No changes were observed until $-40^{\circ} \mathrm{C}$ where a new set of signals started to appear. The spectrum at $-80^{\circ} \mathrm{C}$ showed the signal corresponding to $\mathrm{Ar}{ }_{3} \mathrm{~B}$ (e.g. two singlets at -56.6 and -63.8 ppm ) and two singlets at -56.2 and $-62.2 \mathrm{ppm} . \mathrm{Ar}_{3}{ }_{3} \mathrm{~B}$ can exist in two different conformations as shown in Figure 2.3 , so the second set of singlets could be explained by the rotation of an aryl ring to be in conformation B . However, these two sets of signals are in a 5.5:1 ratio (Figure 2.2). For conformation B , two sets of $o-\mathrm{CF}_{3}$ signals and two sets for $p-\mathrm{CF}_{3}$ signals are expected, both in a $2: 1$ intensity ratio, whereas for conformation A only one $o-\mathrm{CF}_{3}$ and one $p-\mathrm{CF}_{3}$
signal would be expected, giving an overall $3: 3 o / p$ ratio. It therefore seems probable that the chemical shifts coincide for all three aryl rings in conformation A and for two of the rings in conformation B . Equal populations of both conformations would then lead to two $o-\mathrm{CF}_{3}$ and two $p-\mathrm{CF}_{3}$, in a 5:1 ratio for each set. The calculated energy difference between the two conformations is only $0.5 \mathrm{kcal} / \mathrm{mol}$ (value calculated by Dr M.A. Fox using the Gaussian 98 package) so this provides a reasonable explanation for the lowtemperature results.

Figure 2.2: Variable temperature ${ }^{19} F N M R$ spectra of $A r "{ }_{3} B$

In their studies on tris[2-(trifluoromethyl)phenyl]borane, Toyota et al ${ }^{13}$ noticed that the singlet observed at room temperature was decoalesced at $-100^{\circ} \mathrm{C}$ and separated into two singlets at $-117^{\circ} \mathrm{C}$. Unfortunately, due to solvent restrictions, it has not been possible to study $\mathrm{Ar}{ }_{3} \mathrm{~B}$ at a temperature below $-80^{\circ} \mathrm{C}$.

Conformation A

Conformation B

Figure 2.3: Different conformations for $A r{ }^{\prime}{ }_{3} B$

The chemical shift in the ${ }^{11} \mathrm{~B}$ NMR is 73.6 ppm and is within the typical range for tricoordinated boron atoms with three aryl substituents. ${ }^{19}$

A ${ }^{13} \mathrm{C}$ NMR spectrum was recorded at room temperature. Table 2.3 shows the assignments for each carbon.

Figure 2.4: Lettering scheme for Carbon Assignments in $\mathrm{Ar}_{3}{ }^{\prime \prime} B$

| Carbon | $\delta(\mathrm{ppm})$ | $\mathrm{J}(\mathrm{Hz})$ |
| :---: | :---: | :---: |
| A | 143.7 |  |
| B | 133.5 | broad singlet |

Table 2.5: $\delta^{l} H(p p m)$ for $A r^{\prime \prime}{ }_{3} B$

- X-ray structure of $\mathrm{Ar}^{\prime}{ }_{3} \mathrm{~B}$

Crystals were grown by recrystallisation from dichloromethane. The molecular structure at 120 K , as determined by A.L Thompson, is shown in Figure 2.6.

Figure 2.6: Molecular structure of $A r{ }^{\prime \prime}{ }_{3} B$

Ar" ${ }_{3} \mathrm{~B}$ crystallises in the triclinic $\mathrm{P}-1$ space group with $\mathrm{Z}=2$. Like $\mathrm{Ph}_{3} \mathrm{~B}^{11}$ and $\mathrm{Mes}_{3} \mathrm{~B}^{10}$, Ar" ${ }_{3} \mathrm{~B}$ exists in a propeller-like conformation in the ground state, with the three aryl groups twisted out of the plane defined by the three carbons attached to boron. The three rings are twisted by $46.7^{\circ}, 53.7^{\circ}$ and $68.9^{\circ}$ towards the reference plane made by the three carbons bonded to the boron atom, $\mathrm{C}(11), \mathrm{C}(21)$ and $\mathrm{C}(31)$. These angles are larger than those observed in triphenylborane ( $28.3^{\circ}$ ) and are more comparable to those found in mesitylborane $\left(40^{\circ}-60^{\circ}\right)^{11}$ and tris-[2-(trifluoromethyl)phenyl)]borane $\left(40^{\circ}-55^{\circ}\right)^{13}$, reflecting the steric size of the ortho substituents.
B-C distances are 1.582(4) $\AA$ and are similar to those found in $\mathrm{Ar}_{2} \mathrm{BF}$ (1.59 $\AA$ ).
The C-B-C angles are $117.6^{\circ}, 117.0^{\circ}$ and $124.7^{\circ}$ respectively for $\mathrm{C}(11)-\mathrm{B}(1)-\mathrm{C}(21)$, $\mathrm{C}(21)-\mathrm{B}(1)-\mathrm{C}(31)$ and $\mathrm{C}(1)-\mathrm{B}(1)-\mathrm{C}(31)$, reflecting the trigonal geometry of the boron atom. As in $\mathrm{Ar}_{2} \mathrm{BF}$, some short $\mathrm{B}-\ldots \mathrm{F}$ contacts are observed with the fluorines of the ortho- $\mathrm{CF}_{3}$ groups: $\mathrm{F}(13), \mathrm{F}(32)$ and $\mathrm{F}(23)$ with an average interatomic distance of ca. $2.8 \AA$ (Table 2.7). The average distance is very similar to that found in tris-[2(trifluoromethyl)phenyl]borane (see Table 2.7). ${ }^{13}$ The distance $\mathrm{F}(32)--\mathrm{F}(23)$ of $2.688 \AA$ is shorter than the other $\mathrm{F}--\mathrm{F}$ distances $(3.921 \AA$ for $\mathrm{F}(32)-\mathrm{F}(21), 3.125 \AA$ for $\mathrm{F}(11)-\mathrm{F}(33)$, $4.601 \AA$ for $F(31)-F(21)$ and $4.179 \AA$ for $F(31)-F(23)$ ). These short distances can be explained by a smaller C-B-C angle, which allows closer F---F interactions.

Another interesting feature is the bond angles at $\mathrm{C}(11), \mathrm{C}(21)$, and $\mathrm{C}(31)$ : a significant bending deformation, for example $\mathrm{C}(12)-\mathrm{C}(11)-\mathrm{B}(1) 126.7^{\circ}$ and $\mathrm{C}(16)-\mathrm{C}(11)-\mathrm{B}(1)$ $116.8(2)^{\circ}$, results from the avoidance of steric interaction between B and the $\mathrm{CF}_{3}$ moieties.

Table 2.6 shows selected bond lengths ( $\AA$ ) and angles ( ${ }^{\circ}$ ) for $\mathrm{Ph}_{3} \mathrm{~B}^{11} \mathrm{Mes}_{3} \mathrm{~B},{ }^{10}$ (2$\left.\mathrm{CF}_{3} \mathrm{C}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{~B}^{13}$ and $\mathrm{Ar}{ }^{\prime \prime} \mathrm{B}$. The bonds and angles appear to be very similar, even though the presence of a more bulky group should bring more steric hindrance.

The molecular structure shows the molecule in conformation B (Figures 2.3 and 2.6) which is the more stable conformation. The short F---F interactions help to stabilise the molecule.

Table 2.7 lists short B---F contacts in $\left(2-\mathrm{CF}_{3} \mathrm{C}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{~B}$ and $\mathrm{Ar}{ }_{3} \mathrm{~B}$. The intramolecular $\mathrm{B}---$ $F$ distances are similar, which is not surprising, the only difference between those two compounds being the presence of para- $\mathrm{CF}_{3}$ groups in $\mathrm{Ar}_{3}{ }_{3} \mathrm{~B}$ which do not interact with the boron central atom.

### 2.4 Boronic Acids

Over the last decade, boronic acids have been found to be very good catalysts in the Suzuki-Miyaura cross-coupling reaction. Arylboronic acids containing electronwithdrawing substituents such as 2,4,6-tris(trifluoromethyl)phenyl or 3,5bis(trifluoromethyl)phenyl groups act as highly efficient catalysts in the amidation of carboxylic acids by amines. ${ }^{20}$

2,4-Bis(trifluoromethyl)phenyl boronic acid $\left(\mathrm{Ar}^{\prime \prime} \mathrm{B}(\mathrm{OH})_{2}\right)$ has been used as a powerful catalyst in the catalytic asymmetric allylation of aldehydes with allyltrimethylsilanes. ${ }^{20}$

- $\operatorname{Bis}[2,4,6-t r i s($ trifluoromethyl $)$ phenyl $]$ boronic acid $\left(\mathrm{Ar}_{2} \mathrm{~B}(\mathrm{OH})\right)$ :
$\mathrm{Ar}_{2} \mathrm{~B}(\mathrm{OH})$ was obtained by hydrolysis of $\mathrm{Ar}_{2} \mathrm{BF}$. An NMR tube containing $\mathrm{Ar}_{2} \mathrm{BF}$ was left standing for a few weeks.
- NMR

The ${ }^{19} \mathrm{~F}$ NMR spectrum shows two singlets at $-56.2\left(12 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and $-63.8\left(6 \mathrm{~F}, p-\mathrm{CF}_{3}\right)$ ppm. Unfortunately, the ${ }^{11} \mathrm{~B}$ NMR could not be recorded, since the sample was not concentrated enough.

- X-ray structure of $\mathrm{Ar}_{2} \mathrm{~B}(\mathrm{OH})$

Crystals were grown by slow hydrolysis of $\mathrm{Ar}_{2} \mathrm{BF}$. Long exposure of an NMR tube containing $\mathrm{Ar}_{2} \mathrm{BF}$ to the air afforded white crystals of $\mathrm{Ar}_{2} \mathrm{~B}(\mathrm{OH})$ suitable for X-ray diffraction. The molecular structure of $\mathrm{Ar}_{2} \mathrm{~B}(\mathrm{OH})$ at 120 K was determined by A.L Thompson and is shown in Figure 2.7:

Figure 2.7: Molecular structure of $A r_{2} B(O H)$

The structure of $\mathrm{Ar}_{2} \mathrm{~B}(\mathrm{OH})$ at 200 K has already been determined by Fraenk et al ${ }^{7}$ where it was obtained as a partially hydrolysed product, $\mathrm{Ar}_{2} \mathrm{BN}_{3}$ and $\mathrm{Ar}_{2} \mathrm{BOH}$. Their results are very similar to those obtained at 120 K in the present work; the discussion below refers to the data at 120 K . Selected bond distances and angles are included in Table 2.10.

The B-C distances average $1.61 \AA$ and are similar to those found in $\mathrm{Ar}_{2} \mathrm{BF}$. The $\mathrm{O}(1)-\mathrm{B}(1)-\mathrm{C}(21)$ angle is $112.65^{\circ}$, whereas $\mathrm{O}(1)-\mathrm{B}(1)-\mathrm{C}(11)$ is $121.62^{\circ}$ An intramolecular $\mathrm{OH}---\mathrm{F}$ bridge is found for the hydrogen atom of the OH group to one fluorine atom of a $\mathrm{CF}_{3}$ group. The OH distance is $0.84 \AA$, while the $\mathrm{H}(1)--\mathrm{F}(13)$ and $\mathrm{H}(1)---\mathrm{F}(12)$ distances are $2.188 \AA$ and $2.737 \AA$ respectively. As in $\mathrm{Ar}_{2} \mathrm{BF}$ and $\mathrm{Ar}^{\prime}{ }_{3} \mathrm{~B}$, short $\mathrm{B}---\mathrm{F}$ contacts are also observed: $\mathrm{B}(1)-\mathrm{F}(12) 2.914 \AA, \mathrm{~B}(1)-\mathrm{F}(19) 2.816 \AA, \mathrm{~B}(1)-$ $\mathrm{F}(23) 2.823 \AA$ and $\mathrm{B}(1)-\mathrm{F}(28) 2.829 \AA$ (ca. $2.85 \AA$ average).

- 2,6-Bis(trifluoromethyl)phenyl boronic acid $\left(\mathrm{Ar}^{\prime} \mathrm{B}(\mathrm{OH})_{2}\right)$
$\mathrm{Ar}{ }^{\prime} \mathrm{B}(\mathrm{OH})_{2}$ was obtained by slow hydrolysis of $\mathrm{Ar}^{\prime} \mathrm{BCl}_{2}$, leaving the flask exposed to air.
- NMR

The ${ }^{19} \mathrm{~F}$ NMR spectrum exhibited a singlet at $-55.2\left(6 \mathrm{~F}, o-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

- X-ray structure of $\mathrm{Ar}{ }^{\prime} \mathrm{B}(\mathrm{OH})_{2}$

Ar' $\mathrm{B}(\mathrm{OH})_{2}$ crystals were grown in an NMR tube containing a solution of $\mathrm{Ar}^{\prime} \mathrm{BCl}_{2}$ after one month of standing and were submitted for X-ray diffraction. The structure at 120 K was ascertained by A.L Thompson, and is shown in Figure 2.8:

Figure 2.8: Molecular structure of $\mathrm{Ar}^{\prime} \mathrm{B}(\mathrm{OH})_{2}$

Ar' $\mathrm{B}(\mathrm{OH})_{2}$ crystallises in the orthorhombic space group with $\mathrm{Z}=4$. Selected bond distances and angles are included in Table 2.11. The $\mathrm{B}(1)-\mathrm{C}(1)$ distance is $1.597(2) \AA$, and is slightly shorter than the one found in $\mathrm{Ar}_{2} \mathrm{BOH}$ ( $1.613 \AA$ ). The average $\mathrm{B}-\mathrm{O}$ distance is $1.35 \AA$. As in $\mathrm{Ar}_{2} \mathrm{BOH}$, some $\mathrm{H}---\mathrm{F}$ intramolecular contacts were observed: $\mathrm{F}(6)-\mathrm{H}(1 \mathrm{~B}) 2.714 \AA$ and $\mathrm{F}(3)-\mathrm{H}(2 \mathrm{~B}) 2.707 \AA$. Short $\mathrm{B}--\mathrm{F}$ contacts from the $\mathrm{CF}_{3}$ groups in the ortho position were detected as in all other compounds: $\mathrm{B}-\mathrm{F}(2) 2.622$ and $\mathrm{B}-\mathrm{F}(4)$ $2.634 \AA$. Hydrogen atoms of the OH groups appeared to be disordered.

### 2.5 Discussion

### 2.5.1 Comparison of the chemical shifts

The ${ }^{11} \mathrm{~B}$ NMR chemical shifts are listed in Table 2.8:

|  | $\mathbf{A r B C l}_{2}$ | $\mathrm{ArBF}_{2}$ | $\mathbf{A r}_{2} \mathbf{B F}$ | $\mathrm{Ar}_{2} \mathbf{B}(\mathbf{O H})$ | $\mathbf{A r}_{2} \mathbf{B N}{ }^{\text { }}$ | $\mathrm{Ar}_{3} \mathrm{~B}^{9}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\delta^{11} \mathrm{~B}$ (ppm) | 56.8 | 26.0 | 45.1 | - | 49.3 | ? |
|  | $\mathbf{A r}^{\prime} \mathbf{B C l}_{2}$ |  | Ar" ${ }_{2} \mathbf{B F}$ | Ar'B(OH) ${ }_{2}$ |  | $\mathrm{Ar}_{3}{ }_{3} \mathbf{B}$ |
| $\delta^{11} \mathrm{~B}$ (ppm) | 57.5 |  | 47.8 | - |  | 73.6 |
|  |  | MesBF ${ }_{2}{ }^{\text {21 }}$ | $\mathrm{Mes}_{2} \mathbf{B F}{ }^{6}$ | $\mathrm{Mes}_{2} \mathrm{~B}(\mathrm{OH}){ }^{6}$ | $\mathrm{Mes}_{2} \mathrm{BNH}_{2}{ }^{22}$ | $\mathrm{Mes}_{3} \mathrm{~B}^{6}$ |
| $\delta^{11} \mathrm{~B}$ (ppm) |  | 25.7 | 53 | 51.4 | 43.8 | 79.2 |

Table 2.8: ${ }^{\text {II }}$ B NMR chemical shifts for $R B X_{2}$ or $R_{2} B X$ compounds

The chemical shifts for $R_{3} B$ and $R_{2} B X$ are at higher frequency than those for $R B X_{2}$. The overall order is $\mathrm{R}_{3} \mathrm{~B}>\mathrm{R}_{2} \mathrm{BX}>\mathrm{RBX}_{2}$. Trigonal boron is a good $\sigma$ donor and $\pi$ acceptor, whereas halogens are $\sigma$ and $\pi$ donor ligands (Figure 2.9). High electron density around the nucleus and the $\pi$ donor effect causes shielding. The $2 p \pi$ orbital rises in energy with an increase in fluorine substitution, but the combined inductive effect is greater and hence the boron becomes progressively more positively charged. ${ }^{23}$
$\mathrm{Ar}_{3} \mathrm{~B}$ compounds only have $\sigma$ interactions and no $\mathrm{p} \pi$ interactions ( $\mathrm{B}-\mathrm{C}$ bonds); the electron density on boron decreases, causing a deshielding effect. Replacement of an aryl ring by halogens creates a shielding effect due to $\pi$ back donation to the boron, on which the electron density is higher. The more halogens are bonded to the boron, the higher the electron density becomes on boron and thus causes a shielding effect.

Furthermore, the proximity of fluorine atoms from the fluoromes or fluoroxyl ligand to the boron centre (Table 2.10) may allow $\mathrm{p} \pi$ interactions, resulting in the partial occupation of the vacant orbital on boron, and an increase in shielding.

Figure 2.9: Electron donation from fluorine to boron

A series of $a b$ initio calculations has been carried out (at the GIAOHF/6-31G*//HF/631G* level) by M.A Fox using the Gaussian 98 package. ${ }^{24}$ All calculations have been carried out on compounds containing no para-CF3 groups (e.g. Ar or Ar" derivatives). Results are listed in Table 2.9:

| Model Compounds (for calculations) | $\delta^{11} \mathrm{~B}$ calc (ppm) | Compound | $\delta^{11} \mathrm{~B} \exp (\mathrm{ppm})$ |
| :---: | :---: | :---: | :---: |
| tris-(2-CF3 $\mathrm{C}_{6} \mathrm{H}_{4}$ ) | 68.7 | Ar" ${ }_{3} \mathrm{~B}$ | 73.6 |
| Ar' ${ }_{2} \mathrm{BF}$ | 44.1 | $\mathrm{Ar}_{2} \mathrm{BF}$ | 45.1 |
| $\mathrm{Ar}^{2}{ }_{2} \mathrm{~B}(\mathrm{OH})$ | 41.2 | $\mathrm{Ar}^{\prime} \mathrm{B}(\mathrm{OH})$ |  |
| $\mathrm{Ar}^{2}{ }_{2} \mathrm{~B}(\mathrm{OH})$ | 41.2 | $\mathrm{Ar}_{2} \mathrm{~B}(\mathrm{OH})$ |  |
| $\mathrm{Ar}^{\prime} \mathrm{BF}_{2}$ | 22.6 | $\mathrm{ArBF}_{2}$ | 26.0 |
| $\mathrm{Ar}^{\prime} \mathrm{BCl}_{2}$ | 59.3 | $\mathrm{Ar}^{\prime} \mathrm{BCl}_{2}$ | 57.5 |
| $\mathrm{Ar}^{\prime} \mathrm{BCl}_{2}$ | 59.3 | $\mathrm{ArBCl}_{2}$ | 56.8 |
| $\mathrm{Ar}^{\prime} \mathrm{B}(\mathrm{OH})$ | 26.4 | Ar'B(OH) ${ }_{2}$ |  |

Table 2.9: Comparison between $\delta{ }^{11} B$ calculated and experimental

Calculated values are in good agreement with to those found experimentally.

### 2.5.2 Comparison of the molecular structures

Table 2.10 lists selected bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right)$ for $\mathrm{Ar}_{2} \mathrm{BF}, \mathrm{Ar}_{2} \mathrm{BOH}$ and $\mathrm{Ar}_{2} \mathrm{BN}_{3} .7$

The $\mathrm{B}-\mathrm{X}$ distance ( $\mathrm{X}=\mathrm{F}, \mathrm{OH}$ or $\mathrm{N}_{3}$ ) depends on the X substituents. The bigger the group $X$ is, the longer the bonds will be. The same characteristics apply to the B-C distances: $1.620(6) \AA$ for $\mathrm{Ar}_{2} \mathrm{BN}_{3}, 1.61 \AA$ for $\mathrm{Ar}_{2} \mathrm{BOH}$ and $1.59 \AA$ for $\mathrm{Ar}_{2} \mathrm{BF}$. Hence, the ligand X seems to have a direct effect on the B-C bond distances.
This is also observed in $\mathrm{Ar}^{\prime} \mathrm{B}(\mathrm{OH})_{2}$ (Table 2.11), where the B-C distance is intermediate between those in $\mathrm{Ar}_{2} \mathrm{BN}_{3}$ and $\mathrm{Ar}_{2} \mathrm{BF}$.

Table 2.11: Selected Bond Distances ( $\AA$ ) and Angles (') for $A r^{\prime} B(O H)_{2}$ and $A r^{\prime \prime}{ }_{3} B$

### 2.5.3 Short contact distances

In all the compounds, short B---F contacts are observed. The number of contacts depends of the number of $\mathrm{CF}_{3}$ groups in the ortho-position. These are listed in Table 2.12. B---F contacts are shorter in compounds containing only one aryl ring. In $\mathrm{Ar}_{2} \mathrm{~B}(\mathrm{OH})$, the range $2.829-2.914 \AA$ is broader, probably because of the F---H interaction discussed earlier.

|  | $\mathrm{Ar}_{2} \mathrm{BF}$ | $\mathrm{Ar}_{2} \mathrm{~B}(\mathrm{OH})$ | $\mathrm{Ar}^{\prime} \mathrm{B}(\mathrm{OH})_{2}$ | $\mathrm{Ar}^{\prime}{ }^{3} \mathrm{~B}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{~B}-\mathrm{F}$ | $2.763-2.796$ | $2.829-2.914$ | $2.622-2.634$ | $2.800-2.815$ |
| No. of Contacts | 4 | 4 | 2 | 3 |
| No. of ortho- <br> fluorines | 12 | 12 | 6 | 9 |

Table 2.12: Short B---F Contacts (A)

### 2.5.4 Optimised geometry

The geometry of the compounds structurally characterised has been optimised (at the HF/6-31G* level) by M.A. Fox with a Gaussian 98 package ${ }^{24}$. The structure was simulated and bond distances and angles evaluated (Appendix A).

Table 2.13 compares the calculated distances with the experimental data. Values are very similar. In each case, short B---F contacts are found. The optimised values for boronic acids ( $\mathrm{Ar}^{\prime} \mathrm{B}(\mathrm{OH})_{2}$ and $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{~B}(\mathrm{OH})$ ) also show the presence of an intramolecular $\mathrm{F}---\mathrm{H}$ bridge.

### 2.6 Attempted reactions with Aluminium Chloride

Apparently, no previous attempts have been made to synthesise aluminium derivatives containing fluoromes or fluoroxyl ligands

### 2.6.1 Reaction with 2,6-bis(trifluoromethyl)phenyl lithium (Ar'Li) / 2,4bis(trifluoromethyl)phenyl lithium (Ar"Li)

A solution of $\mathrm{Ar}^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ in diethyl ether was added slowly to an $\mathrm{AlCl}_{3}$ solution in diêthyl ether. The ${ }^{19} \mathrm{~F}$ NMR showed a set of signals corresponding to ortho- $\mathrm{CF}_{3}$ and para $-\mathrm{CF}_{3}$ but none of them has been assigned. This reaction appears to give rise to a mixture of mono- and di-substituted compounds.

### 2.6.2 Reaction with 2,4,6-tris(trifluoromethyl)phenyl lithium (Ar'Li)

A solution of ArLi was added to an $\mathrm{AlCl}_{3}$ solution in diethyl ether at $0^{\circ} \mathrm{C}$. A number of signals corresponding to $o-\mathrm{CF}_{3}$ and $p-\mathrm{CF}_{3}$ were observed, indicated the presence of a mixture of different products in solution. However, a peak of high intensity corresponding to the starting material ArLi showed that aluminium chloride does not react very well with ArLi.

Table 2.13: Comparison between optimised and experimental structural data*

### 2.7 Experimental

### 2.7.1 Introduction

- NMR spectroscopy

All manipulations, including NMR sample preparation, were carried out either under an inert atmosphere of dry nitrogen or in vacuo, using standard Schlenk procedures or a glovebox. Chemicals of the best available commercial grades were used, in general without further purification. ${ }^{19}$ F NMR spectra were recorded on a Varian Mercury 200, Varian VXR 400, or Varian Inova 500 Fourier-transform spectrometer at 188.18, 376.35, and 470.26 MHz respectively. ${ }^{11} \mathrm{~B}$ NMR spectra were recorded on the Varian Mercury 300 or Varian Inova 500 spectrometer at 96.22 and 160.35 MHz respectively. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on the Varian VXR 400 instrument at 400 and 100.57 MHz respectively. Chemical shifts were measured relative to external $\mathrm{CFCl}_{3}\left({ }^{19} \mathrm{~F}\right)$ or $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ $\left({ }^{11} \mathrm{~B}\right)$, with the higher frequency direction taken as positive.

- C,H,N analysis

Microanalyses were performed by the microanalytical services of the Department of Chemistry, using micro-combustion on a Perrkin Elmer CE 440 Elemental Analyser.

- X-ray Crystallography

Single crystal structure determinations were carried out from data collected at 120 K , using graphite monochromated Mo $\mathrm{K} \alpha$ radiation $(\lambda=0.71073 \AA)$ on a Bruker SMARTCCD detector diffractometer equipped with a Cryostream $\mathrm{N}_{2}$ flow cooling device. ${ }^{25}$ In each case, series of narrow $\omega$-scans $\left(0.3^{\circ}\right)$ were performed at several $\varphi$-settings in such a way as to cover a sphere of data to a maximum resolution between 0.70 and $0.77 \AA$. Cell parameters were determined and refined using the SMART software, ${ }^{26}$ and raw frame data were integrated using the SAINT program. ${ }^{27}$ The structures were solved using direct methods and refined by full-matrix least squares on $\mathrm{F}^{2}$ using SHELXTL. 28

## - Computation section

All $a b$ initio computations were carried out with the Gaussian 98 package. ${ }^{24}$ The geometries discussed here were optimised at the HF/6-31G* level with no symmetry constraints. Frequency calculations were computed on these optimised geometries at the HF/6-31G* level for imaginary frequencies. Theoretical ${ }^{11} \mathrm{~B}$ chemical shifts at the GIAO$\mathrm{HF} / 6-31 \mathrm{G}^{*} / / \mathrm{HF} / 6-31 \mathrm{G}^{*}$ level have been referenced to $\mathrm{B}_{2} \mathrm{H}_{6}\left(16.6 \mathrm{ppm}^{29}\right)$ and converted to the usual $\mathrm{BF}_{3}$. $\mathrm{OEt}_{2}$ scale: $\delta{ }^{11} \mathrm{~B}=123.4-\sigma\left({ }^{11} \mathrm{~B}\right)$.

### 2.7.2 Synthesis of ArH

The vacuum line used for this reaction was specifically designed for the use and manipulation of $\mathrm{SF}_{4}$. The inside of the line was coated with Teflon to prevent corrosion of the steel from the highly reactive gas. The vacuum system is outlined below (see figure)
An upper reservoir of known volume ( $425 \mathrm{~cm}^{3}$ ) was filled over a period of 15 min with $\mathrm{SF}_{4}$ from a cylinder. The mass of this gas was equal to approximately 150 g . This was subsequently transferred to a small sample bottle (Teflon lined steel), using vacuum transfer methods. From the initial tare of the bottle the quantity of $\mathrm{SF}_{4}$ transferred could be determined. This process was then repeated until the desired quantity of $\mathrm{SF}_{4}(550 \mathrm{~g}, 5.1$ moles) had been obtained. The bottle was then allowed to warm to room temperature

Figure 2.11 Steel Vacuum Line for $\mathrm{SF}_{4}$ Transfer

## Figure 2.11: Autoclave for $\mathrm{SF}_{4}$ Fluorination Reactions

Trimesic acid (benzene-1,3,5-tricarboxylic acid) ( $126 \mathrm{~g}, 0.6$ moles) was introduced into a $1000 \mathrm{~cm}^{3}$ bomb. It was then evacuated and cooled to 76 K in liquid air.
The contents of the steel bottle were then carefully condensed into the bomb and the tare of the bottle checked to ensure that all the $\mathrm{SF}_{4}$ had been transferred. The bomb was then place in a furnace, and heated with the help of thermocouples to a temperature of $150^{\circ} \mathrm{C}$, which was maintained for the duration of the reaction ( 12 hours). The reaction was then allowed to cool to room temperature and the bomb was transferred to a fume cupboard.

The by-products of the reaction are $\mathrm{SO}_{2}, \mathrm{HF}$, and any unreacted $\mathrm{SF}_{4}$. These gases need to be scrubbed, neutralised, and not allowed into the atmosphere. The gases were slowly passed over a funnel, which was placed in a big beaker filled with water.

After scrubbing the gases, the contents of the bomb were then tipped onto crushed ice to remove any unreacted trimesic acid and HF. The mixture was then filtered, and the filtrate washed three times with NaOH . The oily yellow compound was then separated and dried overnight over anhydrous magnesium sulphate.

The product was then purified by distillation using a fractionating column to yield a colourless oil (Bp 114 ${ }^{\circ}$ ). Yield 95g (75.4\%)
${ }^{19}$ F NMR $\left(\mathrm{CDCl}_{3}\right): \delta-63.5$ (singlet) $\mathrm{ppm} ;{ }^{1} \mathbf{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 8.1$ (singlet) ppm.

### 2.7.3 Preparation of ArLi

BuLi ( $41.75 \mathrm{ml}, 1.6 \mathrm{M}$ in hexanes, 78 mmol ) was added dropwise over 10 min to a solution of $\mathrm{ArH}(78 \mathrm{mmol})$ in diethyl ether at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature and stirred for 4 hours, giving a brown solution.
${ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-53.6\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right), \delta-63.6\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right)$

### 2.7.4 Preparation of $\mathbf{A r}{ }^{\prime} \mathbf{L i} / \mathbf{A r}{ }^{\prime} \mathbf{L i}$

BuLi ( $57 \mathrm{ml}, 1.6 \mathrm{M}$ in hexanes, 91.2 mmol ) was added dropwise over 10 min to a solution of Ar'H ( 91.2 mmol ) in diethyl ether ( 200 ml ) at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature and stirred for 4 hours, giving a dark brown solution.
${ }^{19}$ F NMR $\left(\mathrm{CDCl}_{3}\right): \underline{\text { Ar'Li }} \delta$-63.9 (s); $\underline{\text { Ar"Li }} \delta$-62.4 (s), $63.2(\mathrm{~s}) \mathrm{ppm}$.

### 2.7.5 Synthesis of $\mathbf{A r B C l}_{\mathbf{2}}$

A solution of $\mathrm{ArLi}(50 \mathrm{ml}, 20 \mathrm{mmol})$ was added dropwise to a $\mathrm{BCl}_{3}$ solution ( $20 \mathrm{ml}, 1 \mathrm{M}$ in p-xylene, 20 mmol ) in diethyl ether at $-78^{\circ} \mathrm{C}$. A white precipate of LiCl immediately formed. The solution was stirred for 5 hours, giving a yellow solution. The solution was then filtered and solvents were removed under vacuum ( 0.01 Torr), leaving a yellow oil, which was distilled; a yellow oil was collected at $60^{\circ} \mathrm{C}$.
${ }^{19}$ F NMR $\left(\mathrm{CDCl}_{3}\right): \delta-56.3\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.9\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm} ;{ }^{11} \mathbf{B}$ NMR $\left(\mathrm{CDCl}_{3}\right):$ $\delta 56.8 \mathrm{ppm}$ (s).

### 2.7.6 Synthesis of $\mathrm{Ar}_{2} \mathbf{B F}$

In the synthesis described previously for $\mathrm{ArBCl}_{2}$, another product of the reaction is $\mathrm{Ar}_{2} \mathrm{BF}$. When the solvents were removed, a yellow oil and a white solid appeared. The latter was filtered off and washed three times with hexanes and dried in vacuo. Crystals were obtained by recrystallisation from dichloromethane. Yield 1.5 g ( $13 \%$ ).

Elemental analysis for $\mathrm{C}_{18} \mathrm{H}_{4} \mathrm{BF}_{19}$ (592.02): Calc C 36.56, H $0.68 \%$; Found C 35.04 , H $0.98 \%$.
${ }^{19}$ F NMR: $\delta-57.3\left(\mathrm{~d}^{5}{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 14.3 \mathrm{~Hz}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-64.0\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right),-131.5(\mathrm{~m}, 1 \mathrm{~F}, \mathrm{~B}-\mathrm{F})$ $\mathrm{ppm} ;{ }^{11} \mathrm{~B}$ NMR: $\delta 45.1 \mathrm{ppm}(\mathrm{s})$.

### 2.7.7 Synthesis of $\mathbf{A r}^{\prime} \mathbf{B C l}_{\mathbf{2}}$

A solution of $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ mixture in $\mathrm{Et}_{2} \mathrm{O}(100 \mathrm{ml}, 45.6 \mathrm{mmol})$ was added dropwise to a solution of $\mathrm{BCl}_{3}\left(22.8 \mathrm{ml}, 1 \mathrm{M}\right.$ in $p$-xylene, 22.8 mmol ) at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature for 3 hours leaving a brown solution. A white solid of LiCl formed. The solution was filtered and the solvents removed under vacuum, leaving a brown oil, which was distilled under reduced pressure ( 0.05 Torr). A fraction was collected at $48^{\circ} \mathrm{C}$.
${ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-56.8\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right) \mathrm{ppm} ;{ }^{11} \mathbf{B}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 57.5 \mathrm{ppm}$.

### 2.7.8 Synthesis of Ar" ${ }_{2} \mathrm{BF}$

In the synthesis of $\mathrm{Ar}^{\prime} \mathrm{BCl}_{2}$ described previously, another product of the reaction is $\mathrm{Ar}{ }_{2}{ }_{2} \mathrm{BF}$. Using the same reaction, this compound was distilled under reduced pressure yielding a colourless oil $\left[\mathrm{Bp}=92^{\circ} \mathrm{C}\right.$ ( 0.05 Torr) $]$.
${ }^{19}$ F NMR $\left(\mathrm{CDCl}_{3}\right): \delta-57.2\left(\mathrm{~d},{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 14.7 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.3\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right),-86.6(\mathrm{~m}$, 1F, B-F) ppm; ${ }^{11} \mathbf{B}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 47.8 \mathrm{ppm}$.

### 2.7.9 Synthesis of $\mathbf{A r}{ }_{3} \mathbf{B}$

In the synthesis of $\mathrm{Ar}^{\prime} \mathrm{BCl}_{2}$ described previously, a by-product of the reaction is $\mathrm{Ar}^{\prime}{ }_{3} \mathrm{~B}$. After distillation, a white solid remained in the flask. This solid was washed 5 times with dichloromethane and purified by sublimation under vacuum. This afforded some white crystals.
${ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-56.6\left(\mathrm{~s}, 9 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.8\left(\mathrm{~s}, 9 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm} ;{ }^{11} \mathbf{B}$ NMR $\left(\mathrm{CDCl}_{3}\right)$ : $\delta 73.6 \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 143.79$ (broad singlet), $135.2(\mathrm{~s}), 133.6\left(\mathrm{q},{ }^{2} \mathrm{~J}_{\mathrm{C}-\mathrm{F}} 33.7\right)$, $133.5\left(\mathrm{q},{ }^{2} \mathrm{~J}_{\mathrm{C} \text { - }} 33.7\right.$ ) 127.3 (d, J 3.6), 123,1 ( $\mathrm{q}, \mathrm{J}_{\mathrm{C}-\mathrm{F}} 274.2$ ), $122.9\left(\mathrm{q}, \mathrm{J}_{\mathrm{C}-\mathrm{F}} 274.2\right.$ ), (121.1 (broad singlet) ppm; ${ }^{1} \mathbf{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 8.0(\mathrm{~s}), 7.8\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 7.75\right), 7.4\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 7.8\right)$ ppm

# Chapter 3 Group 14 Derivatives 

### 3.1 Introduction

Steric encumbrance in substituents bound to main group elements has led to kinetic stability in complexes. A number of bulky organic substituents has been used to stabilize compounds of group 14 elements, such as mesityl, t-butyl, bis(trimethylsilyl)methyl, tris(trimethylsilyl)methyl, 2,4,6-tri(t-butyl)phenyl and 2,4,6-tri(i-propyl)phenyl. 1,2 Surprisingly, little has been published about group 14 species containing fluoromes or fluoroxyl substituents. In this chapter, the preparation of a series of tetravalent group 14 derivatives ( $\mathrm{Si}, \mathrm{Ge}$ and Sn ) is described.

### 3.1.1 Organosilicons

Organosilicon compounds have a considerable stability due to the strength of the $\mathrm{Si}-\mathrm{C}$ bond. There are three general methods to form organosilicon compounds:

- reaction of $\mathrm{SiCl}_{4}$ with organolithium, organoaluminium, or Grignard reagents:

| $\mathrm{RLi}+\mathrm{SiCl}_{4}$ | $\longrightarrow$ | $\mathrm{RSiCl}_{3}+\mathrm{LiCl}$ |
| :--- | :--- | :--- |
| $\mathrm{R} 3 \mathrm{Al}+3 \mathrm{SiCl}_{4}$ | $\longrightarrow$ | RSiCl <br> 3$+\mathrm{AlCl}_{3}$ |
| $\mathrm{RMgX}+\mathrm{SiCl}_{4}$ | $\longrightarrow$ | $\mathrm{RSiCl}_{3}+\mathrm{MgClX}$ |

- hydrosilation of alkenes

Catalytic addition of Si-H across $\mathrm{C}=\mathrm{C}$ double bonds (except for methyl and phenyl silanes)

$$
\mathrm{RCH}=\mathrm{CH}_{2}+\mathrm{HSiR}_{3} \longrightarrow \mathrm{RCH}_{2} \mathrm{CH}_{2} \mathrm{SiR}_{3}
$$

- direct reaction of RX or ArX with silicon in the presence of Cu as a catalyst (industrial method) ${ }^{3}$

$$
2 \mathrm{MeCl}+\mathrm{Si} \xrightarrow[300^{\circ} \mathrm{C}]{\text { Cu powder }} \mathrm{Me}_{2} \mathrm{SiCl}_{2}
$$

### 3.1.2 Organogermanium derivatives

Preparative routes to organogermanium compounds parallel those for organosilicon compounds (see equations above), via an organolithium or Grignard reagent. Most of the several known organogermanium compounds can be considered as derivatives of $\mathrm{R}_{\mathrm{n}} \mathrm{GeX}_{4-\mathrm{n}}$ or $\mathrm{Ar}_{\mathrm{n}} \mathrm{GeX}_{4-\mathrm{n}}$ where $\mathrm{X}=$ hydrogen, halogen, $\mathrm{OR}, \ldots$

### 3.1.3 Organotin compounds ${ }^{4,5}$

Organotin chemistry has been much more extensively investigated that those of germanium or silicon.

There are three synthetic routes:

- reaction with a Grignard reagent:

$$
4 \mathrm{RMgCl}+\mathrm{SnCl}_{4} \longrightarrow \mathrm{SnR}_{4}+4 \mathrm{MgCl}_{2} \quad \text { ( also with } \mathrm{ArMgCl} \text { ) }
$$

- reaction with an organoaluminium compound:

$$
4 \mathrm{AlR}_{3}+3 \mathrm{SnCl}_{4} \longrightarrow 3 \mathrm{SnR}_{4}+4 \mathrm{AlCl}_{3}
$$

- direct reaction of RX with the element:

$$
2 \mathrm{RX}+\mathrm{Sn} \longrightarrow \mathrm{R}_{2} \mathrm{SnX}_{2}\left(\text { and } \mathrm{R}_{\mathrm{n}} \mathrm{SnX}_{4-\mathrm{n}}\right) \quad \text { (alkyl only) }
$$

A few examples containing the fluoromes substituent attached to group 14 elements have been reported in the literature: $\mathrm{ArSiMe}_{3},{ }^{6} \mathrm{Ar}_{2} \mathrm{SiF}_{2},{ }^{7} \mathrm{Ar}_{2} \mathrm{SiHF}, \mathrm{Ar}_{2} \mathrm{SiH}_{2}{ }^{8}$ and $\mathrm{Ar}_{2} \mathrm{GeH}_{2},{ }^{9}$ which was synthesised from the precursor $\mathrm{Ar}_{2} \mathrm{Ge}$. The reaction of ArLi with $\mathrm{Ph}_{3} \mathrm{SnCl}$ gave $\mathrm{ArSnPh}_{3} .{ }^{10} \mathrm{Ar}_{2} \mathrm{Sn}$ can undergo oxidation reactions to lead to $\operatorname{tin}(\mathrm{IV})$ compounds. Thus, $\mathrm{Ar}_{2} \mathrm{SnF}_{2}$ is prepared by reaction of $\mathrm{AsF}_{5}$ with $\mathrm{Ar}_{2} \mathrm{Sn}$. There are two general routes to prepare $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}: 11$

- Chlorination of $\mathrm{Ar}_{2} \mathrm{Sn}$ :

$$
\mathrm{Ar}_{2} \mathrm{Sn}+\mathrm{Cl}_{2} \longrightarrow \mathrm{Ar}_{2} \mathrm{SnCl}_{2}
$$

- Reaction of ArLi with $\mathrm{SnCl}_{4}$

$$
2 \mathrm{ArLi}+\mathrm{SnCl}_{4} \longrightarrow \mathrm{Ar}_{2} \mathrm{SnCl}_{2}+2 \mathrm{LiCl}
$$

The only examples containing Ar ' or Ar ' are tin derivatives: $\mathrm{Ar}^{\prime} \mathrm{SnMe}_{3},{ }^{12}, 13$ Ar" ${ }^{\prime}$ SnMe $_{3} 12,13$ and $\mathrm{Ar}_{2}{ }_{2} \mathrm{Sn} .{ }^{14}$

$$
\begin{aligned}
& 2 \mathrm{ArLi}+\mathrm{SiCl}_{4} \xrightarrow{\mathrm{~F} / \mathrm{Cl} \text { exchange }} \mathrm{Ar}_{2} \mathrm{SiF}_{2} \\
& 2 \mathrm{ArLi}+\mathrm{HSiCl}_{3} \xrightarrow{\mathrm{~F} / \mathrm{Cl} \text { exchange }}
\end{aligned} \mathrm{Ar}_{2} \mathrm{SiHF}, ~+\mathrm{Ar}_{2} \mathrm{SiH}_{2} \mathrm{Cr}
$$

Preliminary work has been done on $\mathrm{Si}, \mathrm{Ge}$ and Sn derivatives by Xue. ${ }^{15}$ A general reaction between ArLi or $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar} " \mathrm{Li}$ with $\mathrm{ECl}_{4}(\mathrm{E}=\mathrm{Si}, \mathrm{Ge}, \mathrm{Sn})$ was used. Tetravalent derivatives $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiCl}_{2}, \mathrm{ArGeCl}_{3}, \mathrm{Ar}_{2}{ }_{2} \mathrm{GeCl}_{2}, \mathrm{Ar}_{2} \mathrm{SnCl}_{2}$ and $\mathrm{Ar}^{\prime} \mathrm{SnCl}_{2}$ were structurally characterised.

### 3.2 Silicon derivatives

### 3.2.1 Reaction of $\mathrm{SiCl}_{4}$ with 2,4,6-tris(trifluoromethyl)phenyl lithium

## Equation 3.1: Synthesis of $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$

The reaction was carried out following the general method of reacting the lithiated compound ArLi with silicon tetrachloride $\mathrm{SiCl}_{4}$.
ArLi was added slowly to a $\mathrm{SiCl}_{4}$ solution in hexanes at $-78^{\circ} \mathrm{C}$. The ${ }^{19} \mathrm{~F}$ NMR spectrum showed a triplet at $-57.3\left({ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 12.8 \mathrm{~Hz}\right)$, a singlet at -64.2 and a multiplet at $-124.5\left({ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}}\right.$ $12.8 \mathrm{~Hz}) \mathrm{ppm}$. The presence of a triplet at the chemical shift corresponding to the $o-\mathrm{CF}_{3}$ suggests F-F coupling. This is confirmed by a multiplet at -124.5 ppm , assigned to the fluorines bonded directly to silicon. These signals suggest that only $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$ can be isolated from the reaction. This has already been reported by Buijink et al. ${ }^{7}$ The compound was isolated as a yellow oil ( $\mathrm{Bp} 85^{\circ}$ at 0.01 Torr).
The presence of $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$ can be explained by a $\mathrm{Cl} / \mathrm{F}$ exchange while the reaction takes place. This phenomenon has also been observed with the reaction with boron trichloride (Chapter 2), where a similar mechanism to the following has been proposed:

Scheme 3.1: Possible mechanism of the formation of $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$

In order to check when the exchange occurs, an NMR tube reaction between ArH and $\mathrm{SiCl}_{4}$ was attempted. The ${ }^{19} \mathrm{~F}$ NMR spectrum only exhibited the presence of the starting material ArH at -63.5 ppm . This proves that the halogen exchange takes place once the Si (or B) atom is bonded to the ligand.

### 3.2.2 Reaction of $\mathrm{SiCl}_{4}$ with a 2,6-bis(trifluoromethyl)phenyl lithium / 2,4bis(trifluoromethyl)phenyl lithium mixture (Ar'Li/Ar"Li)

The mixture $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ was added to $\mathrm{SiCl}_{4}$ in hexanes at $-78^{\circ} \mathrm{C}$. The ${ }^{19} \mathrm{~F}$ NMR spectrum indicated the presence of different species in solution: $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiCl}_{2}, \mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiCl}_{2}$, $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiF}_{2}$ and $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$ (Figure 3.1). Only $\mathrm{Ar}_{2}{ }_{2} \mathrm{SiCl}_{2}$ and $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$ have been isolated, as a yellow oil and a white solid respectively. Table 3.1 lists the chemical shifts of the different products of the reaction.

Scheme 3.2: Different products of the reaction between Ar'Li/Ar"Li and SiCl ${ }_{4}$

Figure 3.1: ${ }^{19} \mathrm{~F}$ NMR spectrum of the reaction between Ar ' $\mathrm{Li} / \mathrm{Ar}{ }^{\prime \prime} \mathrm{Li}^{2}$ and $\mathrm{SiCl}_{4}$

| Compound | $\delta$ for $o-\mathrm{CF}_{3}(\mathrm{ppm})$ | $\delta$ for $p-\mathrm{CF}_{3}(\mathrm{ppm})$ | $\delta$ for Si-F (ppm) |
| :---: | :---: | :---: | :---: |
| Ar" ${ }_{2} \mathrm{SiCl}_{2}$ | -57.95 s (6F) | -64.2 s (6F) |  |
| $\mathrm{Ar}^{\prime} \mathrm{SiCl}_{2}$ | -58.9 s (12F) |  |  |
| Ar" ${ }_{2} \mathrm{SiF}_{2}$ | $-59.2 \mathrm{t},{ }^{5} \mathrm{~J}_{\mathrm{FFF}} 12.4 \mathrm{~Hz}$ <br> (6F) | -64.1 s (6F) | $\begin{gathered} -133.0 \text { septet, } \\ { }_{\mathrm{J}_{\mathrm{F}-\mathrm{F}} 12.3 \mathrm{~Hz}(2 \mathrm{~F})} \end{gathered}$ |
| Ar' ${ }_{2} \mathrm{SiF}_{2}$ | $-57.5 \mathrm{t},{ }^{5} \mathrm{~J}_{\mathrm{FF}} 12.3 \mathrm{~Hz}$ <br> (12F) |  | $-125.5 \mathrm{~m},{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 12.5 \mathrm{~Hz}$ <br> (2F) |

Table 3.1: $\delta^{19} \mathrm{~F}$ for the different products of the reaction between $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime \prime} \mathrm{Li}^{2}$ and $\mathrm{SiCl}_{4}$

Figure 3.2: ${ }^{19} \mathrm{~F}$ NMR region for the $\mathrm{Si}-\mathrm{F}_{2}$ signals in $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiF}_{2}$ and $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{SiF}_{2}$

- $\mathrm{Ar}{ }_{2} \mathrm{SiCl}_{2}$

Crystals were obtained by recrytallisation from pentane by Xue. ${ }^{15}$ The crystal structure has been determined by A.S. Batsanov (Figure 3.3).

Figure 3.3: Molecular structure of $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{SiCl}_{2}$

- $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiF}_{2}$
$\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiF}_{2}$ was isolated as a white solid and purified by sublimation under vacuum $\left(110^{\circ}\right.$, 0.02 Torr). Crystals were submitted for X-ray diffraction. The structure was determined at 120 K by A.L. Thompson and is shown in Figure 3.4:

Figure 3.4: Molecular structure of $\mathrm{Ar}^{2}{ }_{2} \mathrm{SiF}_{2}$
$\mathrm{Ar}_{2} \mathrm{SiF}_{2}$ crystallises in the triclinic $\mathrm{P}-1$ space group with $\mathrm{Z}=2$. The compound exhibits an approximate tetrahedral geometry at the silicon with a $\mathrm{C}(11)-\mathrm{Si}-\mathrm{C}(21)$ angle of $115.53(8)^{\circ} \mathrm{C}$. This angle is larger than normal for Si , and is due to the steric bulk of the aryl substituents. It is similar to the angle found in $\mathrm{Ar}_{2} \mathrm{SiHF}\left(115.8(11)^{\circ}\right),{ }^{8}$ and smaller than the one reported for $\mathrm{Ar}_{2} \mathrm{SiF}_{2}\left(119.1(2)^{\circ}\right)$. The $\mathrm{F}-\mathrm{Si}-\mathrm{F}$ angle in $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$ was $105.8(2)^{\circ}$, and is $104.06(6)^{\circ}$ in $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiF}_{2}$. The Si-C distances, $\mathrm{Si}-\mathrm{C}(11) 1.895(2) \AA, \mathrm{Si}-$ $\mathrm{C}(21) 1.8991(19) \AA$, are similar to those found in $\mathrm{Ar}_{2} \mathrm{SiHF}$ and $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$, and are within the range of values observed for other tetracoordinate silicon compounds (Si-C values in diarylsilicon dihalides reported to lie between $1.872(17)$ and $\left.1.895(15) \AA^{16}\right)$.
The Si-F distances are $1.5790(3)$ and $1.5694(11) \AA$ and are slightly longer than those found in $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$. Table 3.2 lists selected bond distances $(\AA)$ for $\mathrm{Ar}_{2} \mathrm{SiHF},{ }^{8} \mathrm{Ar}_{2} \mathrm{SiF}_{2}{ }^{7}$ and $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$.
As found in $\mathrm{Ar}_{2} \mathrm{SiHF}$ and $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$, four short $\mathrm{Si}--\mathrm{F}$ contacts are observed in $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$, within the range 2.745-3.073 $\AA$, at an average interatomic distance of ca. 2.9162 $\AA$. This value is shorter than the sum of van der Waals radii of $3.57 \AA .{ }^{17}$

Figure 3.6 shows the Si---F short contacts (covalent bonds are shown by a solid line and weaker interactions are designated by a dashed line).
Figure 3.7 shows the environment around the central atom.
This reveals a (4+4) coordination environment, which approaches a distorted tetracapped tetrahedron. The four Si---F contacts occupy approximate faces of the tetrahedron defined by the bonded atoms $\mathrm{C}(11), \mathrm{C}(21), \mathrm{F}(1)$ and $\mathrm{F}(2)$. This was also found for $\mathrm{Ar}_{2} \mathrm{SiF}_{2}{ }^{8}$ and $\mathrm{Ar}_{2} \mathrm{SiHF}$ as well as for bis[2,6-(dimethylaminomethyl)]silane, where the lone pair of each N was coordinated to $\mathrm{Si}^{1}{ }^{18}$

| $\mathrm{Ar}_{2} \mathrm{SiHF}$ |  | $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$ |  | Ar' $2^{\text {SiF }}{ }_{2}$ |  |

Table 3.2: Selected Bond Distances ( $\AA$ ) and Angles ( ${ }^{\circ}$ ) for $\mathrm{Ar}_{2} \mathrm{SiHF}, \mathrm{Ar}_{2} \mathrm{SiF}_{2}$ and $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$

Figure 3.5: Si---F Short Contacts (covalent bonds are shown by a solid line and weaker interactions are designated by a red line)

Figure 3.6: Coordination Environment around Silicon

### 3.3 Germanium derivatives

### 3.3.1 Reaction of $\mathrm{GeCl}_{4}$ with 2,4,6-tris(trifluoromethyl)phenyl lithium (ArLi)

ArLi was added to a solution of $\mathrm{GeCl}_{4}$ in hexanes. The ${ }^{19} \mathrm{~F}$ NMR spectrum showed the presence of two species in solutions: $\mathrm{ArGeCl}_{3}$ and $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$. These were isolated as an oil and a solid respectively.

- $\mathrm{ArGeCl}_{3}$

Equation 3.2: Synthesis of $\mathrm{ArGeCl}_{3}$

This compound was purified by distillation under vacuum, leaving a yellow oil which crystallises on standing.
The ${ }^{19} \mathrm{~F}$ NMR spectrum of $\mathrm{ArGeCl}_{3}$ showed a singlet (6F) at -52.9 ppm for the ortho- $\mathrm{CF}_{3}$ and a singlet ( 3 F ) at -63.5 ppm corresponding to the para- $\mathrm{CF}_{3}$ groups.
$\mathrm{ArGeCl}_{3}$ was previously synthesised by Xue, ${ }^{15}$ and its crystal structure determined by A.S. Batsanov (Figure 3.7).

Figure 3.7: Molecular structure of $\mathrm{ArGeCl}_{3}$

The geometry of the germanium atom is close to tetrahedral. There is a mirror plane through the molecule, with two of the chlorines and the $o-\mathrm{CF}_{3}$ groups on the phenyl ring being symmetry-related. There is some asymmetry in the $\mathrm{Cl}-\mathrm{Ge}-\mathrm{Cl}$ bond angles which range from $99.82(3)^{\circ}$ to $108.46(17)^{\circ}$. This probably arises from the Ge-F interactions with the fluorines in the ortho $\mathrm{CF}_{3}$ groups. The $\mathrm{Ge}-\mathrm{C}$ bond ( $\mathrm{Ge}-\mathrm{C}(1) 1.981(2)$ ) distance is within the literature range for $\mathrm{Ge}-\mathrm{C}$ bonds in $\mathrm{Ar}-\mathrm{Ge}$ derivatives (1.942(1)-2.081(3) $\AA) .{ }^{9}, 19$ The $p-\mathrm{CF}_{3}$ groups are found to be disordered.

- $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$

Equation 3.3: Synthesis of $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$
$\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ was isolated as a beige solid, which was purified by recrystallisation from dichloromethane. The ${ }^{19}$ F NMR spectrum exhibited two singlets at -54.4 (12F) and $-64.1(6 \mathrm{~F}) \mathrm{ppm}$ respectively, corresponding to the $o-\mathrm{CF}_{3}$ and $p-\mathrm{CF}_{3}$ groups.

## - X-ray structure of $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$

$\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ was isolated as a beige solid and recrystallised from dichloromethame. Crystals were submitted for X-ray diffraction. The structure was determined at 120 K by A.L. Thompson, and is shown in Figure 3.8:

Figure 3.8: Molecular structure of $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$
$\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ crystallises in the monoclinic $\mathrm{P} 2(1) / \mathrm{c}$ space group with $\mathrm{Z}=4$. One of the para $\mathrm{CF}_{3}$ group is disordered. A distortion from tetrahedral geometry is observed, with a C-$\mathrm{Ge}-\mathrm{C}$ angle of $120.07^{\circ}$. The $\mathrm{Ge}-\mathrm{C}$ bond lengths are 1.997 (3) $\AA$ for $\mathrm{Ge}-\mathrm{C}(21)$ and 2.072(3) $\AA$ for $\mathrm{Ge}-\mathrm{C}(11)$. These distances are similar to those found in $\mathrm{Ar}_{2} \mathrm{Ge}$ (2.081(3) and $2.072(3) \AA)^{19}$ and are slightly longer than those in $\mathrm{ArGeCl}_{3}: 15 \mathrm{Ge}-\mathrm{C}(1) 1.981(2) \AA$. This is probably due to the steric hindrance imposed by a second fluoromes ligand. The $\mathrm{Ge}-\mathrm{Cl}$ distances are in the same range as those found in $\mathrm{ArGeCl}_{3}$ and slightly shorter than those
in $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{GeCl}_{2} .{ }^{15}$ However, this compound shows some asymmetry in the $\mathrm{Ge}-\mathrm{Cl}$ distances, of $2.1174(9) \AA$ and $2.1513(9) \AA$. Selected bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right)$ for $\mathrm{ArGeCl}_{3}$, $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ and $\mathrm{Ar}_{2}{ }_{2} \mathrm{GeCl}_{2}$ are listed in Table 3.3 and Table 3.4. The four $\mathrm{C}-\mathrm{Ge}-\mathrm{Cl}$ angles in the disubstituted compounds vary between $96.65(9)^{\circ}$ and $118.17(9)^{\circ}$.

| Bond Distance ( $\AA$ ) |  | Angle ( ${ }^{\circ}$ ) |  |
| :---: | :---: | :---: | :---: |
| $\mathrm{Ge}-\mathrm{C}(1)$ | $1.981(2)$ | $\mathrm{C}(1)-\mathrm{Ge}-\mathrm{Cl}(2)$ | $111.89(6)$ |
| $\mathrm{Ge}-\mathrm{Cl}(12)$ | $2.1117(8)$ | $\mathrm{C}(1)-\mathrm{Ge}-\mathrm{Cl}(1)$ | $113.72(4)$ |
| $\mathrm{Ge}-\mathrm{Cl}(1)$ | $2.1277(4)$ | $\mathrm{Cl}(2)-\mathrm{Ge}-\mathrm{Cl}(1)$ | $108.461(17)$ |
| $\mathrm{Ge}-\mathrm{Cl}(1) \# 1$ | $2.1277(4)$ | $\mathrm{C}(1)-\mathrm{Ge}-\mathrm{Cl}(1) \# 1$ | $113.72(4)$ |
|  |  | $\mathrm{Cl}(2)-\mathrm{Ge}-\mathrm{Cl}(1) \# 1$ | $108.461(17)$ |
|  |  | $\mathrm{Cl}(1)-\mathrm{Ge}-\mathrm{Cl}(1) \# 1$ | $99.82(3)$ |

Table 3.3: Selected Bond distances ( $\AA$ ) and Angles ( ${ }^{\circ}$ ) for $\mathrm{ArGeCl}_{3}{ }^{15}$

| Bond Distance ( $\AA$ ) |  |  |  | Angle ( ${ }^{\circ}$ ) |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ | $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ |  | $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ | $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ |
| $\mathrm{Ge}(1)-\mathrm{C}(1)$ | $2.017(3)$ | $1.957(2)$ | $\mathrm{C}(1)-\mathrm{Ge}(1)-\mathrm{C}(11)$ | $120.07(12)$ | $119.93(10)$ |
| $\mathrm{Ge}(1)-\mathrm{C}(11)$ | $1.997(3)$ | $1.958(2)$ | $\mathrm{C}(1)-\mathrm{Ge}(1)-\mathrm{Cl}(1)$ | $96.65(9)$ | $108.30(7)$ |
| $\mathrm{Ge}(1)-\mathrm{Cl}(1)$ | $2.1513(9)$ | $2.1483(8)$ | $\mathrm{C}(1)-\mathrm{Ge}(1)-\mathrm{Cl}(2)$ | $118.17(9)$ | $108.19(7)$ |
| $\mathrm{Ge}(1)-\mathrm{Cl}(2)$ | $2.1174(9)$ | $2.1497(10)$ | $\mathrm{C}(11)-\mathrm{Ge}(1)-\mathrm{Cl}(1)$ | $113.46(9)$ | $107.76(7)$ |

Table 3.4: Selected Bond Distances (A) and Angles ( ${ }^{\circ}$ ) in $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ and $\mathrm{Ar"}^{2} 2 \mathrm{GeCl}_{2} 15$

Three short Ge---F interactions are observed within the range 2.757-3.009 $\AA$, with an average interatomic distance of ca. $2.88 \AA$. The distance is shorter than the sum of van der Waals radii of $3.66 \AA .17$

### 3.3.2 Reaction of $\mathrm{GeCl}_{4}$ with a 2,6-bis(trifluoromethyl)phenyl lithium / 2,4bis(trifluoromethyl)phenyl lithium mixture (Ar'Li/Ar"Li)

Ar'Li/Ar'Li was added to a solution of $\mathrm{GeCl}_{4}$ in hexanes. The ${ }^{19} \mathrm{~F}$ NMR spectrum showed predominantly the presence of $\mathrm{Ar}_{2}{ }_{2} \mathrm{GeCl}_{2}$, with two singlets at $-58.7\left(6 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and $-64.1 \mathrm{ppm}\left(6 \mathrm{~F}, p-\mathrm{CF}_{3}\right)$. A single resonance at -53.8 ppm was assigned to the symmetrical molecule $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{GeCl}_{2}$, since there were no signals of corresponding intensity for the $p-\mathrm{CF}_{3}$. There were other low intensity peaks present in the spectrum however, and the signal at -53.8 ppm could possibly arise from $\mathrm{ArGeCl}_{3}$, which should also give a single ${ }^{19} \mathrm{~F}$ resonance (Figure 3.9).

Figure 3.9: ${ }^{19} \mathrm{~F}$ NMR spectrum of the reaction between $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}$ "Li with $\mathrm{GeCl}_{4}$

### 3.4 Tin derivatives

### 3.4.1 Reaction of $\mathrm{SnCl}_{4}$ with 2,4,6-tris(trifluoromethyl)phenyl lithium (ArLi)

A solution of ArLi was added to a $\mathrm{SnCl}_{4}$ solution in hexanes. The ${ }^{19} \mathrm{~F}$ NMR spectrum indicated the presence of $\mathrm{ArSnCl}_{3}$ and $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$.

- $\mathrm{ArSnCl}_{3}$

Equation 3.4: Synthesis of $\mathrm{ArSnCl}_{3}$

This compound was isolated as an oil and purified by distillation under reduced pressure (0.01 Torr) (Bp $85^{\circ} \mathrm{C}$ ).

The ${ }^{19} \mathrm{~F}$ NMR spectrum consisted of two singlets, one with Sn satellites at $-55.9\left({ }^{4} \mathrm{~J}_{\mathrm{Sn}-\mathrm{F}}\right.$ $\left.19.2 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and one at $-63.0\left(3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$. The ${ }^{119} \mathrm{Sn}$ NMR spectrum showed a singlet at -140.7 ppm .

- $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$

Equation 3.5: Synthesis of $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$
$\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$ was isolated as a solid and recrystallised from diethyl ether.
The ${ }^{19} \mathrm{~F}$ NMR spectrum exhibited singlets at -56.9 (with Sn satellites, ${ }^{4} \mathrm{~J}_{\mathrm{Sn}-\mathrm{F}} 10.0 \mathrm{~Hz}, 12 \mathrm{~F}$, $\left.o-\mathrm{CF}_{3}\right)$ and $-63.9\left(6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$. The ${ }^{119} \mathrm{Sn}$ NMR spectrum consisted of a singlet at -146.7 ppm.
$\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$ has already been synthesised by Xue, ${ }^{15}$ and its crystal structure ascertained by A.E Goeta (Figure 3.10).

Figure 3.10: Molecular structure of $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$

The $\mathrm{Sn}-\mathrm{Cl}$ bond lengths are similar (2.2977(17) and $2.3259(18) \AA$ ) to the values found for the only ArSnCl compound which has been structurally characterised, $\mathrm{Ar}_{2} \mathrm{ClSn}\left(\mu_{2}-\right.$ O) $\mathrm{SnClAr}_{2}$, of 2.310 (1) and 2.319 (2) $\AA .{ }^{20}$

### 3.4.2 Reaction of $\mathrm{SnCl}_{4}$ with a 2,6-bis(trifluoromethyl)phenyl lithium / 2,4bis(trifluoromethyl)phenyl lithium mixture (Ar'Li/Ar"Li)

An $\mathrm{Ar}^{\prime} \mathrm{Li} / \mathrm{Ar}^{\prime \prime} \mathrm{Li}$ solution in diethyl ether was added to a solution of $\mathrm{SnCl}_{4}$ in hexanes at room temperature. The ${ }^{19} \mathrm{~F}$ NMR spectrum showed the presence of two species in solution: $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$ and $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$ (Figure 3.11)

Figure 3.11: ${ }^{19} \mathrm{~F}$ NMR spectrum of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2} / \mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{SnCl}_{2}$

- $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$

Equation 3.6: Synthesis of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$
$\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$ was isolated as a beige solid and recrystallised from pentane and diethyl ether.

One singlet with Sn satellites was observed in the ${ }^{19} \mathrm{~F}$ NMR spectrum at $-56.7 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{Sn}-\mathrm{F}}\right.$ $10.0 \mathrm{~Hz}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}$ ). The ${ }^{119} \mathrm{Sn}$ NMR spectrum showed a singlet at -141.1 ppm .
The X-ray structure of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$ has been determined by A. E. Goeta from previous work by Xue (Figure 3.12). ${ }^{15}$

Figure 3.12: Molecular structure of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$

The $\mathrm{Sn}-\mathrm{C}$ bond distance (2.176(2)) is slightly shorter than in $\mathrm{ArSn}(\mathrm{IV})$ and $\mathrm{ArSn}(\mathrm{II})$ derivative, which range from $2.179(6)$ to $2.316(9) \AA .21-23 \cdot 10,20,24-26$

- $\mathrm{Ar}_{2}{ }_{2} \mathrm{SnCl}_{2}$

Equation 3.7: Synthesis of $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{SnCl}_{2}$

This compound was synthesized as an oil, which was purified by distillation under reduced pressure. The ${ }^{19} \mathrm{~F}$ NMR spectrum consisted of two singlets at -58.9 ( $6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ) and $-63.8\left(6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$. The ${ }^{119} \mathrm{Sn}$ spectrum showed a signal at -97.4 ppm .

### 3.5 Discussion

### 3.5.1 Solution-state NMR Spectroscopy

${ }^{19} \mathrm{~F}$ NMR data for all the silicon derivatives are given in Table 3.5.

| Compound | $\delta$ for $o-\mathrm{CF}_{3}(\mathrm{ppm})$ | $\delta$ for $p-\mathrm{CF}_{3}(\mathrm{ppm})$ | $\delta$ for Si-F (ppm) |
| :---: | :---: | :---: | :---: |
| $\mathrm{Ar}{ }_{2} \mathrm{SiCl}_{2}$ | -57.9, s (6F) | -64.2, s (6F) |  |
| Ar' ${ }_{2} \mathrm{SiCl}_{2}$ | -58.9, s (12F) |  |  |
| Ar" ${ }_{2} \mathrm{SiF}_{2}$ | $-59.2, \mathrm{t},{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 12.4 \mathrm{~Hz}$ <br> (6F) | -64.1, s (6F) | $\begin{gathered} -133.0, \text { septet }{ }^{5}{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} \\ 12.3 \mathrm{~Hz}(2 \mathrm{~F}) \end{gathered}$ |
| Ar' ${ }_{2} \mathrm{SiF}_{2}$ | $-57.5, \mathrm{t},{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 12.3 \mathrm{~Hz}$ <br> (12F) |  | $-125.5 \mathrm{~m},{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 12.5 \mathrm{~Hz}$ <br> (2F) |
| $\mathrm{Ar}_{2} \mathrm{SiF}_{2}{ }^{7}$ | $-57.3, \mathrm{t},{ }^{5} \mathrm{~J}_{\mathrm{FF}} 12.8 \mathrm{~Hz}$ <br> (12F) | -64.2, s (6F) | $-124.5 \mathrm{~m},{ }^{5} \mathrm{~J}_{\mathrm{FF}} 12.8 \mathrm{H}$ <br> (2F) |

Table 3.5: ${ }^{19}$ F NMR data for Silicon (IV) Compounds

With either ArLi or the mixture $\mathrm{Ar}^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ a $\mathrm{Cl} / \mathrm{F}$ exchange is observed. However, this exchange appeared to be slower for fluoroxyl since chloride compounds such as $\mathrm{Ar}{ }_{2} \mathrm{SiCl}_{2}$ and $\mathrm{Ar}{ }_{2} \mathrm{SiCl}_{2}$ could be identified in the ${ }^{19} \mathrm{~F}$ NMR spectrum. Interestingly, there was more of the less sterically hindered chloride, $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{SiCl}_{2}$ present than $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiCl}_{2}$, but more $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiF}_{2}$ than $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiF}_{2}$ (Figure 3.1). This possibly indicates that $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiCl}_{2}$
undergoes faster chlorine/fluorine exchange than $\mathrm{Ar}_{2}{ }_{2} \mathrm{SiCl}_{2}$. The overall order of exchange rate could then be: $\mathrm{Ar}_{2} \mathrm{SiCl}_{2}>\mathrm{Ar}^{\prime} \mathrm{SiCl}_{2}>\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiCl}_{2}$.
No halogen exchange has been observed for Ge or Sn derivatives.
Table 3.6 lists the NMR data ( ${ }^{19} \mathrm{~F}$ and ${ }^{119} \mathrm{Sn}$ ) for Ge and Sn derivatives:

| Compound | $\delta{ }^{19} \mathrm{~F}(\mathrm{ppm})$ for $o-\mathrm{CF}_{3}$ | $\delta{ }^{19} \mathrm{~F}(\mathrm{ppm})$ for $p-\mathrm{CF}_{3}$ | $\delta^{119} \mathrm{Sn}$ |
| :---: | :---: | :---: | :---: |
| $\mathrm{ArGeCl}_{3}$ | $-52.9 \mathrm{~s}(6 \mathrm{~F})$ | $-63.5 \mathrm{~s}(3 \mathrm{~F})$ |  |
| $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ | $-54.4 \mathrm{~s}(12 \mathrm{~F})$ | $-64.1 \mathrm{~s}(6 \mathrm{~F})$ |  |
| $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{GeCl}_{2}$ | $-58.7 \mathrm{~s}(6 \mathrm{~F})$ | $-64.1 \mathrm{~s}(6 \mathrm{~F})$ |  |
| $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{GeCl}_{2}$ | $-53.8 \mathrm{~s}(12 \mathrm{~F})^{\mathrm{a}}$ |  |  |
| $\mathrm{ArSnCl}_{3}$ | -55.9 s with sats, ${ }^{4} \mathrm{~J}_{\mathrm{Sn}-\mathrm{F}} 19.2 \mathrm{~Hz}(6 \mathrm{~F})$ | $-63.0 \mathrm{~s}(3 \mathrm{~F})$ | -140.7 |
| $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$ | -56.9 s with sats, ${ }^{4} \mathrm{~J}_{\mathrm{Sn}-\mathrm{F}} 10.0 \mathrm{~Hz}(12 \mathrm{~F})$ | $-63.9 \mathrm{~s}(6 \mathrm{~F})$ | -146.7 |
| $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$ | -56.7 s with sats, ${ }^{4} \mathrm{~J}_{\mathrm{Sn}-\mathrm{F}} 10.0 \mathrm{~Hz}$ |  | -141.1 |
| $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$ | $-58.9 \mathrm{~s}(6 \mathrm{~F})^{\mathrm{b}}$ | $-63.8 \mathrm{~s}(6 \mathrm{~F})$ | -97.4 |

Table 3.6: ${ }^{19}$ F NMR and ${ }^{119}$ Sn NMR data for Germanium (IV) and Tin (IV) Compounds

The $\delta{ }^{19} \mathrm{~F}$ values are all in the same range for the three elements studied ( $\mathrm{Si}, \mathrm{Ge}, \mathrm{Sn}$ ) and correspond to the shifts found in all compounds containing ortho and para $\mathrm{CF}_{3}$ group. When these elements are reacted with the fluoroxyl mixture, the less sterically hindered compound $\mathrm{Ar}{ }_{2}{ }_{2} \mathrm{ECl}_{2}$ is found to be predominant with $\mathrm{E}=\mathrm{Si}$ or Ge . However, with Sn , the solution contains mainly the more sterically hindered disubstituted product $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$.

[^3]The larger size of the tin atom relative to silicon or germanium will reduce the steric hindrance between ligands in these $\psi$-tetrahedral structures, and probably explains the reversal in isomeric ratio between $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{ECl}_{2}$ and $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{ECl}_{2}$.

### 3.5.2 X-ray Crystallography

$\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ and $\mathrm{Ar}_{2} \mathrm{SnCl}_{2} 15$ are isostructural. $\mathrm{Ar}_{2}{ }_{2} \mathrm{GeCl}_{2}$ and $\mathrm{Ar}_{2}{ }_{2} \mathrm{SiCl}_{2} 15$ have also been found to be isostructural. $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ and $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$ both have a very marked distortion from tetrahedral geometry as reflected in the C-E-C and C-E-Cl angles (Table 3.7). The largest angle around the E central atom is the C-E-C angle, being $120.07(12)^{\circ}$ for $\mathrm{C}(11)-$ $\mathrm{Ge}-\mathrm{C}(21)$ and $120.3(2)^{\circ}$ for $\mathrm{C}(1)-\mathrm{Sn}-\mathrm{C}(11)$. In $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$, the $\mathrm{C}-\mathrm{Ge}-\mathrm{Cl}$ angles vary from $96.65(9)$ to $118.17(9)^{\circ}$, a variation of more than $21^{\circ}$. Similarly, in $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$ the $\mathrm{C}-\mathrm{Sn}-\mathrm{Cl}$ angles vary between 96.14 and $118.94^{\circ}$.

The structures of compounds containing fluoroxyl ligand have shown some disordered para- $\mathrm{CF}_{3}$ groups.

Close E-F contacts are found to two or more fluorine atoms in all synthesised compounds, and are listed in Table 3.8. They are all shorter than the expected sum of the van der Waals radii for E and F . Similar secondary interactions between group 14 elements and fluorines in $o-\mathrm{CF}_{3}$ groups have been described in the literature. In the case of $\mathrm{Ar}_{2} \mathrm{SiF}_{2}, \mathrm{Ar}_{2} \mathrm{SiHF}$, and $\mathrm{Ar}^{\prime} \mathrm{SiF}_{2}$, four secondary $\mathrm{Si}--\mathrm{F}$ interactions are observed between 2.715 and $3.056 \AA, 2.713$ and $3.075 \AA$, and 2.745 and $3.073 \AA$ (Table 3.8) respectively. The coordination environment approaches a distorted tetracapped tetrahedron. Such a structure does not apply for tin or germanium compounds, which exhibit only three E---F short contacts, although in all instances there are further fluorines at longer distances. The secondary bonding appears to play a crucial role in determining the overall geometry of the compounds, and can lead to considerable distortion of the bond angles in the $\Psi$-tetrahedron.
Table 3.7: Selected Bond Distances( $\mathcal{A}$ ) and Angles ( $)$ ) for $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ and $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$

| Compound | Range $(\AA)$ | No of contacts | No of $o$-Fluorines |
| :---: | :---: | :---: | :---: |
| $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiCl}_{2} 15$ | $2.882-2.901$ | 2 | 6 |
| $\mathrm{Ar}^{\prime} \mathrm{SiF}_{2}$ | $2.745-3.073$ | 4 | 12 |
| $\mathrm{ArGeCl}_{3} 15$ | 2.909 | 2 | 6 |
| $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ | $2.757-3.009$ | 3 | 12 |
| $\mathrm{Ar}_{2}{ }_{2} \mathrm{GeCl}_{2} 15$ | $2.848-2.860$ | 2 | 6 |
| $\mathrm{Ar}_{2} \mathrm{SnCl}_{2} 15$ | $2.722-3.014$ | 3 | 12 |
| $\mathrm{Ar}_{2} \mathrm{SnCl}_{2} 15$ | $2.688-3.002$ | 3 | 12 |

Table 3.8: Short E---F contacts

### 3.6 Experimental

### 3.6.1 Introduction

- NMR spectroscopy
${ }^{119} \mathrm{Sn}$ NMR spectra were recorded on the Varian Inova 500 spectrometer at 186.37 MHz . Chemical shifts were measured relative to external $\mathrm{Me}_{4} \mathrm{Sn}$, with the higher frequency direction taken as positive.
- X-ray Crystallography

Single crystal structure determinations were carried out from data collected at 120 K , using graphite monochromated Mo K $\alpha$ radiation ( $\lambda=0.71073 \AA$ ) on a Bruker SMARTCCD detector diffractometer equipped with a Cryostream $\mathrm{N}_{2}$ flow cooling device. ${ }^{27}$ In each case, series of narrow $\omega$-scans ( $0.3^{\circ}$ ) were performed at several $\varphi$-settings in such a way as to cover a sphere of data to a maximum resolution between 0.70 and $0.77 \AA$. Cell parameters were determined and refined using the SMART software, ${ }^{28}$ and raw frame data were integrated using the SAINT program. ${ }^{29}$ The structures were solved using direct methods and refined by full-matrix least squares on $\mathrm{F}^{2}$ using SHELXTL. 30

### 3.6.2 Synthesis of $\mathbf{A r}_{\mathbf{2}} \mathbf{S i F}_{\mathbf{2}}$

A solution of $\operatorname{ArLi}(100 \mathrm{ml}, 30 \mathrm{mmol})$ in diethyl ether was added dropwise to a solution of $\mathrm{SiCl}_{4}(2.5 \mathrm{~g}, 1.72 \mathrm{ml}, 15 \mathrm{mmol})$ in hexanes at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature and stirred for 5 hours. A white precipitate formed. The solution was filtered and solvents were removed under vacuum, leaving a yellow oil. This oil was distilled under reduced pressure ( 0.01 Torr), giving a yellow oil, $\mathrm{Bp} 85^{\circ} \mathrm{C}$.

Elemental analysis for $\mathrm{C}_{18} \mathrm{H}_{4} \mathrm{~F}_{20} \mathrm{Si}$ (628.28), Calc: C 34.41 , H $0.64 \%$; Found: C 32.9 , H $0.75 \%$.
${ }^{19} \mathrm{~F}$ NMR $\left.\left(\mathrm{CDCl}_{3}\right): \delta-57.3\left(\mathrm{t},{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 12.8 \mathrm{~Hz}\right), 12 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-64.2\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right),-124.5(\mathrm{~m}$, $\left.{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 12.8 \mathrm{~Hz}, 2 \mathrm{~F}\right)$.

### 3.6.3 Synthesis of $\mathbf{A r}{ }_{2} \mathbf{S i C l}_{\mathbf{2}}$

An Ar'Li/Ar"Li ( $50 \mathrm{ml}, 20 \mathrm{mmol}$ ) solution in diethyl ether was added dropwise to a solution of $\mathrm{SiCl}_{4}(1.7 \mathrm{~g}, 10 \mathrm{mmol})$ in pentane at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature and stirred for 3 hours. A precipitate of LiCl formed. This was filtered off and the solvents and excess $\mathrm{SiCl}_{4}$ were removed under vacuum, leaving a yellow sticky oil which was distilled under reduced pressure ( 0.01 Torr). A fraction was collected at $120^{\circ} \mathrm{C}$. $\mathrm{Ar}_{2}{ }_{2} \mathrm{SiCl}_{2}$ was purified by recrystallisation from pentane. Yield: 1.8 g (32.4\%).

Elemental analysis for $\mathrm{C}_{16} \mathrm{H}_{6} \mathrm{Cl}_{2} \mathrm{~F}_{12} \mathrm{Si}$ (525.20), Calc C 36.6, H 1.15\%; Found C 36.8, H 1.24\%
${ }^{19}$ F NMR $\left(\mathrm{CDCl}_{3}\right): \delta-57.9\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-64.2\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 3.6.4 Synthesis of $\mathrm{Ar}^{\prime}{ }_{2} \mathbf{S i F}_{2}$

An Ar'Li/Ar"Li ( $50 \mathrm{ml}, 40 \mathrm{mmol}$ ) solution in diethyl ether was added dropwise to a solution of $\mathrm{SiCl}_{4}(3.39 \mathrm{~g}, 2.3 \mathrm{ml}, 20 \mathrm{mmol})$ in hexanes at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature and stirred for 3 hours. A precipitate of LiCl formed. This was filtered off and the solvents and excess $\mathrm{SiCl}_{4}$ were removed under vacuum, leaving a yellow oil $\left(\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiCl}_{2}\right)$ and a white solid ( $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SiF}_{2}$ ). This solid was washed three times with hexanes and purified by sublimation under vacuum, giving white crystals. Yield: 2.5 g (12.7\%).

Elemental analysis for $\mathrm{C}_{16} \mathrm{H}_{6} \mathrm{~F}_{14} \mathrm{Si}$ (492.29), Calc C 39.04, H 1.23\%; Found C 38.3, H 1.24\%
${ }^{19}$ F NMR $\left(\mathrm{CDCl}_{3}\right): \delta-57.5\left(\mathrm{t},{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 12.3 \mathrm{~Hz}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-125.5\left(\mathrm{~m},{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{F}} 12.5 \mathrm{~Hz}, 2 \mathrm{~F}, \mathrm{Si}-\right.$ F)

### 3.6.5 Synthesis of $\mathrm{ArGeCl}_{3}$

An $\operatorname{ArLi}(50 \mathrm{ml}, 30 \mathrm{mmol})$ solution in diethyl ether was added dropwise to a $\mathrm{GeCl}_{4}$ solution ( $3.2 \mathrm{~g}, 1.71 \mathrm{ml}, 15 \mathrm{mmol}$ ) in hexanes at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature and stirred for 4 hours. A white precipitate of LiCl appeared which
was filtered off. The solvents and excess $\mathrm{GeCl}_{4}$ were removed under vacuum, leaving a yellow oil and a white solid. The yellow oil was filtered and then distilled under reduced pressure ( 0.01 Torr), giving a colourless oil of $\mathrm{ArGeCl}_{3}$, bp $85^{\circ} \mathrm{C}$. After one month, fine crystals formed. Yield: 2.6 g (19\%)

Elemental analysis for $\mathrm{C}_{9} \mathrm{H}_{2} \mathrm{Cl}_{3} \mathrm{Fg}_{9} \mathrm{Ge}$ (460.07), Calc C 23.50 , H $0.44 \%$, Found C $24.1, \mathrm{H}$ 1.16\%
${ }^{19}$ F NMR $\left(\mathrm{CDCl}_{3}\right): \delta-52.9\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.5\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 3.6.6 Synthesis of $\mathbf{A r}_{\mathbf{2}} \mathbf{G e C l}_{\mathbf{2}}$

An $\operatorname{ArLi}(50 \mathrm{ml}, 30 \mathrm{mmol})$ solution in diethyl ether was added dropwise to a $\mathrm{GeCl}_{4}$ solution ( $3.2 \mathrm{~g}, 1.71 \mathrm{ml}, 15 \mathrm{mmol}$ ) in hexanes at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature and stirred for 4 hours. A white precipitate of LiCl appeared which was filtered off. The solvents and excess $\mathrm{GeCl}_{4}$ were removed under vacuum, leaving a yellow oil and a white solid. The white solid was filtered off and washed 3 times with hexanes. Yield: 3.17 g (30\%). Crystals were grown by recrystallisation from dichloromethane.

Elemental analysis for $\mathrm{C}_{18} \mathrm{H}_{4} \mathrm{Cl}_{2} \mathrm{~F}_{18} \mathrm{Ge}$ (705.72), Calc C 30.64, H 0.57\%, Found C 30.59, H 0.58\%
${ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-54.4\left(\mathrm{~s}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-64.1\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 3.6.7 Synthesis of $\mathbf{A r " ~}_{\mathbf{2}} \mathbf{G e C l}_{\mathbf{2}}$

A solution of $\operatorname{Ar}{ }^{\prime} \mathrm{Li} / \operatorname{Ar}{ }^{\prime} \mathrm{Li}(60 \mathrm{ml}, 40 \mathrm{mmol})$ in diethyl ether was added dropwise to a solution of $\mathrm{GeCl}_{4}(4.29 \mathrm{~g}, 2.6 \mathrm{ml}, 20 \mathrm{mmol})$ in diethyl ether at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature and stirred for 2 hours. A white precipitate of LiCl formed. The solution was filtered and the solvents were removed under vacuum, leaving a black oil. This oil was distilled under reduced pressure ( 0.01 Torr ) and a fraction was collected at $80-90^{\circ} \mathrm{C}$. Yield: $5.8 \mathrm{~g}(51 \%)$. After one week, small crystals formed.
Elemental analysis for $\mathrm{C}_{16} \mathrm{H}_{6} \mathrm{Cl}_{2} \mathrm{~F}_{12} \mathrm{Ge}$ (569.72), Calc: C 33.7, H 1.06, Cl 12.45\%; Found: C 32.4\%, H 1.53, Cl 12.8\%.
${ }^{19} \mathrm{~F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-58.7\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-64.1\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 3.6.8 $\quad$ Synthesis of $\mathbf{A r S n C l} 3 / \mathbf{A r}_{2} \mathbf{S n C l}_{2}$

An ArLi ( $50 \mathrm{ml}, 30 \mathrm{mmol}$ ) solution in diethyl ether was added slowly to a solution of $\mathrm{SnCl}_{4}(3.90 \mathrm{~g}, 2.75 \mathrm{ml}, 15 \mathrm{mmol})$ in hexanes at $-78^{\circ} \mathrm{C}$. The solution was then allowed to warm to room temperature and stirred for 5 hours. A white precipitate of LiCl appeared. The solution was filtered and the solvents were removed under vacuum, leaving a brown
oil and a solid. The oil was filtered and distilled under reduced pressure (0.01 Torr), giving a yellow oil of $\mathrm{ArSnCl}_{3}\left(\mathrm{Bp} 85^{\circ} \mathrm{C}\right)$ in a small quantity. The solid was washed 3 times with hexanes and dried under vacuum $\left(\mathrm{Ar}_{2} \mathrm{SnCl}_{2}\right)$. Crystals were obtained by recrystallisation from diethyl ether. Yield 3.8 g (51\%).

Elemental analysis for $\mathrm{C}_{18} \mathrm{H}_{4} \mathrm{Cl}_{2} \mathrm{~F}_{18} \mathrm{Sn}$ (751.82), Calc: C 28.76, H $0.54 \%$; Found: C 28.60, H 0.78\%
${ }^{19}{ }^{\mathrm{F}}$ NMR $\left(\mathrm{CDCl}_{3}\right): \mathrm{ArSnCl}_{3}: \delta-55.9$ (s with Sn satellites, $\left.{ }^{4} \mathrm{~J}_{\mathrm{Sn}-\mathrm{F}} 19.2 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.0$ ( $\mathrm{s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}$ ) ppm; $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}: \delta-56.9$ (s with Sn satellites, ${ }^{4} \mathrm{~J}_{\mathrm{Sn}-\mathrm{F}} 10.0 \mathrm{~Hz}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), -63.9 (s, 6F, $\left.p-\mathrm{CF}_{3}\right) \mathrm{ppm} ;{ }^{119} \mathrm{Sn}$ NMR $\left(\mathrm{CDCl}_{3}\right): \underline{\mathrm{ArSnCl}_{3}}: \delta-140.7 \mathrm{ppm} . \underline{\mathrm{Ar}_{2} \mathrm{SnCl}_{2}}:$ $\delta-146.7 \mathrm{ppm}$.

### 3.6.9 Synthesis of $\mathbf{A r}^{\prime}{ }_{2} \mathbf{S n C l}_{2} / \mathbf{A r}{ }_{2} \mathbf{S n C l}_{\mathbf{2}}$

An $\mathrm{Ar}^{\prime} \mathrm{Li} / \mathrm{Ar}$ 'Li ( $250 \mathrm{ml}, 94 \mathrm{mmol}$ ) solution in diethyl ether was added dropwise to a solution of $\mathrm{SnCl}_{4}(12.24 \mathrm{~g}, 8.63 \mathrm{ml}, 47 \mathrm{mmol})$ at room temperature. The solution was stirred for 4 hours. A white precipitate of LiCl appeared. The brown solution was filtered and solvents and excess $\mathrm{SnCl}_{4}$ were removed under vacuum, leaving a brown sticky oil and a brown solid. The oil was filtered $\left(\mathrm{Ar}_{2} \mathrm{SnCl}_{2}\right)$ and the solid washed with pentane and dichloromethane and dried in vacuo, giving a beige solid ( $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$ ). Crystals were grown by recrystallisation from pentane and diethyl ether.

Yield ( $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SnCl}_{2}$ ) 3.48g (57\%).
Elemental analysis for $\mathrm{C}_{16} \mathrm{H}_{6} \mathrm{Cl}_{2} \mathrm{~F}_{12} \mathrm{Sn}$ (615.82), Calc: C 31.21, H $0.98 \%$; Found C 29.7, H 1.26\%.
${ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \mathrm{Ar}_{2}{ }_{2} \underline{S n C l}_{2}: \delta-56.7$ (s with Sn satellites, ${ }^{4} \mathrm{~J}_{\mathrm{Sn}-\mathrm{F}} 10.0 \mathrm{~Hz}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}$ ) ppm; $\mathrm{Ar}_{2}{ }_{2} \mathrm{SnCl}_{2}: \delta-58.9\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.8\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm} ;{ }^{119} \mathrm{Sn}$ NMR $\left(\mathrm{CDCl}_{3}\right)$ : $\underline{\mathrm{Ar}_{2}{ }_{2} \mathrm{SnCl}_{2}}: \delta-141.1 \mathrm{ppm}, \underline{\mathrm{Ar}_{2}{ }_{2} \mathrm{SnCl}_{2}}: \delta-97.4 \mathrm{ppm}$.

## Chapter 4

## Group 15 Derivatives

### 4.1 Introduction

Many researches have been devoted to low coordinate species of group 15 in the last 30 years. Since the preparation of the first stable diphosphene $\mathrm{Ar}^{*} \mathrm{P}=\mathrm{PAr}^{*}$ ( $\mathrm{Ar}^{*}$ : 2,4,6-tri${ }^{\text {tbutylphenyl}},{ }^{1}$ and phosphaalkyne, $\mathrm{P} \equiv \mathrm{C}^{\mathrm{t}} \mathrm{Bu}^{2}$ in 1981, the field of low coordinate organophosphorus chemistry has rapidly expanded. Low coordination P-chemistry is now a major area of study that has been the subject of numerous reviews ${ }^{3-8}$ and several books. 9,10 Although low coordinate arsenic compounds are generally less stable than their phosphorus analogues, their chemistry has been well-developed, ${ }^{11}$ and both arsenic and phosphorus are now widely used in organo-group 15 chemistry and as ligands in organometallic synthesis. Until recently, the organic chemistry of antimony and bismuth had been little investigated, mainly because of the decrease of stability of these compounds relative to those of P or As. However, some advances have been made in this field over the last five years. ${ }^{12}$

Group 15 elements (E) have three common oxidation states (I, III, V) and are known to have coordination numbers from one $(\mathrm{RC} \equiv \mathrm{E})$ to six $\left(\left[\mathrm{ECl}_{6}\right]^{-}\right)$. Low coordinate species are considered to be those with coordination number three or lower.

- Three coordinate species

There is a vast amount of E (III) chemistry (particularly of phosphorus and arsenic compounds), much of which is based around the derivatisation of $\mathrm{EX}_{3}(\mathrm{X}=\mathrm{Cl}, \mathrm{Br}, \mathrm{I})$ and the formation of E-F and E-H derivatives. A very common reaction is that between an organolithium species and $\mathrm{EX}_{3}$ to form the lithium halide and the desired product $\mathrm{REX}_{2}$.

$$
\mathrm{RLi} \xrightarrow[\text { ether }]{\mathrm{EX}_{3}} \mathrm{REX}_{2}+\mathrm{LiX}
$$

Phosphorus and arsenic can also form $\mathrm{R}_{2} \mathrm{EX}$ and $\mathrm{R}_{3} \mathrm{E}$, depending on the bulk of the R group. For example, $\mathrm{PPh}_{3}$ can be synthesised but $\mathrm{Ar}_{3} \mathrm{P}$ has never been prepared. The only
example containing three Ar ligands is $\mathrm{Ar}_{3} \mathrm{~B},{ }^{13}$ which has a different geometry but which has not been structurally characterised.
The hydride derivatives $\mathrm{REH}_{2}$ or $\mathrm{R}_{2} \mathrm{EH}$ can be prepared by reduction of the chloride compounds with $\mathrm{Bu}_{3} \mathrm{SnH}$ or $\mathrm{LiAlH}_{4}$. Fluorination of $\mathrm{RECl}_{2}$ or $\mathrm{R}_{2} \mathrm{ECl}$ leads to the formation of fluoro-derivatives.

$$
\begin{aligned}
\mathrm{RECl}_{2}+2 \mathrm{Bu}_{3} \mathrm{SnH} & \longrightarrow \mathrm{REH}_{2}+2 \mathrm{Bu}_{3} \mathrm{SnCl} \\
\mathrm{RECl}_{2}+1 / 2 \mathrm{LiAlH}_{4} & \longrightarrow \mathrm{REH}_{2}+1 / 2 \mathrm{LiAlCl}_{4} \\
\mathrm{RECl}_{2}+\mathrm{SbF}_{3} & \longrightarrow \mathrm{REF}_{2}
\end{aligned}
$$

### 4.2 Phosphorus Derivatives

A number of phosphorus derivatives containing the Ar, Ar' or Ar" ligand has been reported in the literature: $\mathrm{ArPCl}_{2},{ }^{14,15} \mathrm{Ar}_{2} \mathrm{PCl},{ }^{14} \mathrm{ArPClF},{ }^{14} \mathrm{ArPF}_{2},{ }^{14} \mathrm{ArPH}_{2}, 14,15$ $\mathrm{Ar}_{2} \mathrm{PH},{ }^{16} \mathrm{Ar}^{\prime} \mathrm{PCl}_{2},{ }^{17} \mathrm{Ar}^{\prime} \mathrm{PH}_{2},{ }^{18} \mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime}{ }^{\mathrm{PPCl},}{ }^{19} \mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime}{ }^{\prime} \mathrm{PF}^{20}$ and $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PF}^{20} \mathrm{~A}$ general method has been used in these syntheses, with $\mathrm{PCl}_{3}$ or $\mathrm{PBr}_{3}$ reacting directly with ArLi or $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ at low temperature with continuous stirring for a few hours.

### 4.2.1 Reaction with 2,4,6-tris(trifluoromethyl)phenyl lithium (ArLi)

4.2.1.1 $\quad \mathrm{ArPCl}_{2}$

Equation 4.1: Synthesis of $\mathrm{ArPCl}_{2}$
$\mathrm{ArPCl}_{2}$ was purified by distillation under reduced pressure $\left(\mathrm{Bp} 60^{\circ} \mathrm{C}\right)$, yielding a colourless liquid. The ${ }^{31} \mathrm{P}$ NMR spectrum gave a septet at $145.6 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 61.3 \mathrm{~Hz}\right.$ ) (Figure 4.1). The ${ }^{19} \mathrm{~F}$ NMR showed a doublet and a singlet at $-53.3\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 61.3 \mathrm{~Hz}, o-\mathrm{CF}_{3}\right.$ ) and at $-64.2 \mathrm{ppm}\left(p-\mathrm{CF}_{3}\right)$ respectively.
These values agreed with those found by Goodwin ${ }^{13}$ and Roden. ${ }^{21}$

Figure 4.1: ${ }^{31} P$ NMR spectrum of $\mathrm{ArPCl}_{2}$

### 4.2.1.2 $\quad \mathrm{Ar}_{2} \mathrm{PCl}$

Equation 4.2: Synthesis of $\mathrm{Ar}_{2} \mathrm{PCl}$

This compound was obtained by reaction of two equivalents of ArLi with $\mathrm{PCl}_{3} . \mathrm{Ar}_{2} \mathrm{PCl}$ was distilled under reduced pressure $\left(\mathrm{Bp} 100^{\circ} \mathrm{C}\right)$ to give a clear yellow oil.

- NMR spectrscopy

The ${ }^{31} \mathrm{P}$ NMR spectrum exhibited a multiplet ( 13 lines) at $74.9 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 41.9 \mathrm{~Hz}, 12 \mathrm{~F}\right.$ ). The ${ }^{19} \mathrm{~F}$ NMR spectrum showed a doublet at $-54.4\left({ }^{4} \mathrm{~J}_{\text {P-F }} 41.2 \mathrm{~Hz}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and a singlet at $-64.1\left(6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

- X-ray crystallography

Crystals were grown by recrystallisation from dichloromethane and submitted for X-ray diffraction. The structure was ascertained by A.L. Thompson at 120 K and is shown in Figure 4.2:

Figure 4.2: Molecular Structure of $\mathrm{Ar}_{2} \mathrm{PCl}$
$\mathrm{Ar}_{2} \mathrm{PCl}$ crystallises in the monoclinic $\mathrm{P} 2(1) / \mathrm{n}$ space group with $\mathrm{Z}=4$. Selected bond lengths $(\AA)$ and angles $\left({ }^{\circ}\right)$ are listed in Table 4.1 below:

| Bond Distances $(\AA)$ |  | Angles $\left(^{\circ}\right)$ |  |
| :---: | :---: | :--- | :---: |
|  |  |  |  |
| $\mathrm{P}(1)-\mathrm{Cl}(1)$ | $2.0628(10)$ | $\mathrm{C}(11)-\mathrm{P}(1)-\mathrm{C}(21)$ | $109.87(12)$ |
| $\mathrm{P}(1)-\mathrm{C}(11)$ | $1.882(3)$ | $\mathrm{C}(11)-\mathrm{P}(1)-\mathrm{Cl}(1)$ | $103.68(9)$ |
| $\mathrm{P}(1)-\mathrm{C}(21)$ | $1.885(5)$ | $\mathrm{C}(21)-\mathrm{P}(1)-\mathrm{Cl}(1)$ | $92.95(9)$ |

Table 4.1: Selected Bond lengths ( $\mathcal{A}$ ) and Angles ( ${ }^{\circ}$ ) for $\mathrm{Ar}_{2} \mathrm{PCl}$

P-C bond distances are slightly longer than those found in $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime}{ }^{\prime} \mathrm{PCl}, 19,21$ the only $\mathrm{Ar}_{2} \mathrm{PCl}$ compound structurally characterised so far [P-C(1) 1.854(2), $\mathrm{P}-\mathrm{C}(11)$ 1.857(2) $\AA]$. This is due to the steric hindrance imposed by the $\mathrm{CF}_{3}$ groups in the ortho position. The $\mathrm{P}-\mathrm{Cl}$ bond length is $2.0628(10) \AA$ and is the similar to the $\mathrm{P}-\mathrm{Cl}$ bond distance in Ar'Ar" $\mathrm{PCl}(2.061(1) \AA)$. However, these $\mathrm{P}-\mathrm{Cl}$ bond distances are relatively short in comparison with previously reported $\mathrm{R}_{2} \mathrm{PCl}$ (where at least one of the R groups is alkyl) structures (CSD). This distance varies from 2.06 to $2.35 \AA$. The P-Cl distance is sensitive to electronic effects from other groups bonded to phosphorus, and its shortening here can be attributed to the electron-withdrawing properties of the $\mathrm{CF}_{3}$ groups on the aromatic rings.

An interesting feature of the crystal structure is the asymmetry in the C-P-Cl bond angles, which differ by more than $10^{\circ}$ (Table 4.1). Similar observations have been reported without comment in the literature for $\mathrm{Ar}_{2} \mathrm{AsCl},{ }^{22} \mathrm{Ar}_{2} \mathrm{SbCl}^{22}$ and $\mathrm{Ar}_{2} \mathrm{BiCl}^{23}$ (Table 4.2). This asymmetry might arise as a consequence of secondary interactions between group 15 elements and fluorines of the ortho- $\mathrm{CF}_{3}$ groups.

In $\mathrm{Ar}_{2} \mathrm{PCl}$, five short contacts are observed between phosphorus and the fluorine atoms of the $o-\mathrm{CF}_{3}$ : P---F(12) 2.843, P---F(13) 3.796, P---F(23) 3.111, P---F(28) 3.001, P---F(29) 2.954

| Compound | $\mathrm{Ar}_{2} \mathrm{PCl}$ | $\mathrm{Ar}_{2} \mathrm{AsCl}$ | $\mathrm{Ar}_{2} \mathrm{SbCl}$ | $\mathrm{Ar}_{2} \mathrm{BiCl}$ |
| :---: | :---: | :---: | :---: | :---: |
| E-Cl | $2.0628(10)$ | $2.1920(12)$ | $2.358(11)$ | $2.463(3)$ |
| E-C(1) | $1.882(3)$ | $2.023(4)$ | $2.22(3)$ | $2.356(8)$ |
| E-C(2) | $1.885(3)$ | $2.016(4)$ | $2.25(3)$ | $2.338(7)$ |
| $\mathrm{C}(1)-\mathrm{E}-\mathrm{C}(2)$ | $109.87(12)$ | $107.53(16)$ | $107.0(12)$ | $101.3(9)$ |
| C(1)-E-Cl | $103.68(9)$ | $100.57(12)$ | $88.4(9)$ | $99.5(2)$ |
| C(2)-E-Cl | $92.95(9)$ | $92.04(11)$ | 22 | $87.8(2)$ |

Table 4.2: Comparison of Key Bond Distances ( $\AA$ ) and Angles ( ${ }^{\circ}$ ) for $\mathrm{Ar}_{2} E C l(E=P, A s, S b$ or Bi$)$

* Data for the orthorhombic modification at 130 K

### 4.2.1.3 $\mathrm{ArPBr}_{2}$

ArLi was added to a $\mathrm{PBr}_{3}$ solution in diethyl ether at $-78^{\circ} \mathrm{C} . \mathrm{ArPBr}_{2}$ was obtained as an orange oil which, after distillation under reduced pressure, gave colourless crystals.

Equation 4.3: Synthesis of $\mathrm{ArPBr}_{2}$

- NMR spectroscopy

The ${ }^{31}$ PNMR spectrum consisted of a septet at $130 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\text {P-F }} 62.3 \mathrm{~Hz}\right)$. The ${ }^{19}$ F NMR spectrum showed a doublet at $-53.1\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 62.4 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and a singlet at $-64.1(3 \mathrm{~F}$, p-CF $\mathrm{C}_{3}$ ppm.

- X-ray crystallography

Crystals were obtained after distillation and submitted for X-ray diffraction without any further purification. The structure was determined by A.S. Batsanov at 110 K and is shown in Figure 4.3:

Figure 4.3: Molecular structure of $\mathrm{ArPBr}_{2}$
$\mathrm{ArPBr}_{2}$ crystallises in the triclinic $\mathrm{P}_{1}$ space group with $\mathrm{Z}=4$. It crystallises with two independent molecules in the asymmetric unit. Selected bond distances and angles are listed in Table 4.3.

| Bond distances <br> $(\AA)$ | $\mathrm{P}(1)-\mathrm{Br}(1)$ | $2.2228(8)$ | $\mathrm{P}(2)-\mathrm{Br}(3)$ | $2.2166(8)$ |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{P}(1)-\mathrm{Br}(2)$ | $2.2153(8)$ | $\mathrm{P}(2)-\mathrm{Br}(4)$ | $2.2194(8)$ |
|  | $\mathrm{C}(1)$ | $1.879(3)$ | $\mathrm{P}(2)-\mathrm{C}(11)$ | $1.887(3)$ |
| Angles $\left(^{\circ}\right)$ | $\mathrm{C}(1)-\mathrm{P}(1)-\mathrm{Br}(1)$ | $102.52(9)$ | $\mathrm{C}(11)-\mathrm{P}(2)-\mathrm{Br}(3)$ | $103.22(8)$ |
|  | $\mathrm{Br}(2)-\mathrm{P}(1)-\mathrm{Br}(1)$ | $105.35(3)$ | $\mathrm{Br}(3)-\mathrm{P}(2)-\mathrm{Br}(4)$ | $104.90(3)$ |

Table 4.3: Selected Bond distances ( $\AA$ ) and Angles ( ${ }^{\circ}$ ) for $\mathrm{ArPBr}_{2}$

The P-C bond length is similar to those found in $\mathrm{Ar}_{2} \mathrm{PCl}$ and $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime} \mathrm{PCl} .{ }^{19}$ These values are also in the same range as those found in other $\mathrm{R}_{2} \mathrm{PBr}$ structures ${ }^{24}$ (where P $\mathrm{C}=1.885(6)$ and $1.891(6))$. The $\mathrm{Br}-\mathrm{P}-\mathrm{Br}$ angles $(\mathrm{Br}(2)-\mathrm{P}(1)-\mathrm{Br}(1) 105.35(3) ; \mathrm{Br}(3)-\mathrm{P}(2)-$ $\operatorname{Br}(4) 104.90(3))$ are slightly larger than the value reported in the literature for $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{C}(\mathrm{Me}) \mathrm{PBr}_{2}, 25 \mathrm{Ph}_{3} \mathrm{P}=\mathrm{C}(\mathrm{Tms}) \mathrm{PBr}_{2},{ }^{25}$ (Table 4.4) and $\mathrm{C}_{5} \mathrm{H}\left(\mathrm{CHMe}_{2}\right)_{4} \mathrm{PBr}_{2}{ }^{26}$ which range from $93.5(1)^{\circ}$ to $96.06(7)^{\circ}$. The sum of the bond angles in $\mathrm{ArPBr}_{2}\left(\mathrm{ca} .310^{\circ}\right)$ is also larger when compared with the first two compounds mentioned above, where it varies from 295.8 to $305.7^{\circ}$, reflecting the greater steric demand of the ortho- $\mathrm{CF}_{3}$ groups.
The $\mathrm{P}-\mathrm{Br}$ bond lengths $2.2228(8), 2.2153(8), 2.2166(8), 2.2194(8)$ are slightly shorter than usually found in organophosphorus bromides (for example values between 2.268(2) and $2.489(3) \AA),{ }^{24-30}$ although shorter distances have been observed in $\mathrm{PBr}_{3}$ complexes
with $\mathrm{Cr}(\mathrm{CO})_{5} 31,32$ and $\mathrm{W}(\mathrm{CO})_{5}^{32}$. This parallels the observation of a shorter $\mathrm{P}-\mathrm{Cl}$ bond in $\mathrm{Ar}_{2} \mathrm{PCl}$ and $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime} \mathrm{PCl} .19$

Short P---F secondary interactions are found in this compound in the range 2.865-3.208 $\AA$ for $\mathrm{P}(1)$ and $2.877-3.217 \AA$ for $\mathrm{P}(2)$. The distance are shorter in all instances than the sum of the empirical van der Waals radii of $\mathrm{P}(1.91 \AA)$ and $\mathrm{F}(1.40 \AA),{ }^{33}$ as well as the theoretical ones (estimated as 2.05 and $1.42 \AA$ respectively ${ }^{34}$ ).

The para- $\mathrm{CF}_{3}$ groups are found to be disordered, as often observed in this kind of compound.

|  | $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{C}(\mathrm{Me}) \mathrm{PBr}_{2}$ |  |  |  | $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{C}(\mathrm{Tms}) \mathrm{PBr}_{2}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{P}(1)-\operatorname{Br}(1)$ | 2.436(2) | $\mathrm{P}(2)-\operatorname{Br}(3)$ | 2.489(3) | $\mathrm{P}-\mathrm{Br}(1)$ | 2.401(2) |
| Bond distances <br> ( $\AA$ ) | $\begin{gathered} \mathrm{P}(1)-\mathrm{Br}(2) \\ \mathrm{P}(1)-\mathrm{C}(1) \end{gathered}$ | $\begin{aligned} & 2.262(3) \\ & 1.678(10) \end{aligned}$ | $\mathrm{P}(2)-\mathrm{Br}(4)$ $\mathrm{P}(2)-\mathrm{C}(1)$ | $2.238(30$ $1.728(9)$ | $\mathrm{P}(1)-\mathrm{Br}(2)$ $\mathrm{P}(1)-\mathrm{C}(1)$ | $2.2282(2)$ $1.718(7)$ |
|  | $\mathrm{Br}(1)-\mathrm{P}-\mathrm{Br}(2)$ | 93.5(1) | $\mathrm{Br}(2)-\mathrm{P}(2)-\mathrm{Br}(3)$ | 94.8(1) | $\operatorname{Br}(1)-\mathrm{P}(1)-\operatorname{Br}(2)$ | 95.2(7) |
|  | $\operatorname{Br}(1)-\mathrm{P}(1)-\mathrm{C}(1)$ | 101.8(4) | $\mathrm{Br}(3)-\mathrm{P}(2)-\mathrm{C}(1)$ | 109.4(3) | $\operatorname{Br}(1)-\mathrm{P}(1)-\mathrm{C}(1)$ | 106.0(2) |

Table 4.4: Selected Bond distances and Angles for $\mathrm{RPBr}_{2}$ compounds ${ }^{25,26}$

### 4.2.1.4 $\mathrm{Ar}_{2} \mathrm{PBr}$

Attempts have been made to form $\mathrm{Ar}_{2} \mathrm{PBr}$ from the reaction of two equivalents of ArLi and $\mathrm{PBr}_{3}$. However, the formation of this product has never been observed in the solution state NMR spectroscopy. This is probably due to the steric hindrance of the Ar ligand and the bromine atom compared with the chlorine.

### 4.2.2 Reaction with 2,6-bis(trifluoromethyl)phenyl lithium (Ar'Li) / 2,4bis(trifluoromethyl)phenyl lithium (Ar"Li)

When the $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ mixture reacts with $\mathrm{PX}_{3}$, it can give rise to a series of five different mono- or disubstituted products.

Scheme 4.1: Different products of the reaction between Ar 'Li/Ar"Li and $\mathrm{PCl}_{3}$

### 4.2.2.1 $\quad \mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$

Equation 4.4: Synthesis of $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$

This compound was synthesised as a yellow oil.
The ${ }^{31} \mathrm{P}$ NMR of this compound consisted of a septet at $\delta 148.4\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}=61.3 \mathrm{~Hz}\right)$. The ${ }^{19} \mathrm{~F}$ NMR spectrum showed a doublet at $\delta-53.2\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}=61.3 \mathrm{~Hz}\right)$, corresponding to the two ortho- $\mathrm{CF}_{3}$ groups.

### 4.2.2.2 $\quad \mathrm{Ar}^{\prime \prime} \mathrm{PCl}_{2}$

Equation 4.5: Synthesis of $\mathrm{Ar}^{\prime \prime} \mathrm{PCl}_{2}$

This product could not be separated from the first substitute $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ because of their very close boiling points, caused by their identical molecular mass.
The ${ }^{31} \mathrm{P}$ NMR exhibited a quartet at $\delta 151.6 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\text {P.F }} 83.8 \mathrm{~Hz}\right.$ ). This coupling constant is different than the one for $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ because of the position of the $\mathrm{CF}_{3}$ groups. In fact, in $\mathrm{Ar}{ }^{\prime} \mathrm{PCl}_{2}$, there is only one $\mathrm{CF}_{3}$ in the ortho-position whereas there are two in $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$. Comparing the coupling constants between both compounds ( $\mathrm{JAr}^{\prime} \mathrm{PCl}_{2}<\mathrm{JAr}^{\prime \prime} \mathrm{PCl}_{2}$ ), it is possible to say that the $o-\mathrm{CF}_{3}$ groups in $\mathrm{Ar}^{\prime \prime} \mathrm{PCl}_{2}$ interacts more with the phosphorus
atom. This could imply that the distance between the phosphorus atoms and the fluorine atom is shorter in $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ than in $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$. The ${ }^{19} \mathrm{~F}$ NMR spectrum showed two signals, a doublet at $-56.5\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 83.8 \mathrm{~Hz}, o-\mathrm{CF}_{3}\right)$ and a singlet at $-63.6\left(p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

Figure 4.4: ${ }^{31} \mathrm{P}$ NMR of the mixture of $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{PCl}_{2}$

### 4.2.2.3 $\mathrm{Ar}{ }_{2} \mathrm{PCl}$

Equation 4.6: Synthesis of $\mathrm{Ar}{ }^{\prime}{ }_{2} \mathrm{PCl}$

- NMR spectroscopy

The ${ }^{31} \mathrm{P}$ NMR spectrum shows a septet at $68.1 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 65.6 \mathrm{~Hz}\right.$ ), implying two $\mathrm{CF}_{3}$ groups in ortho positions.

The ${ }^{19} \mathrm{~F}$ NMR consists of a doublet at $-57.3 \mathrm{ppm}\left(6 \mathrm{~F},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 65.6 \mathrm{~Hz}\right)$ and one singlet at $\delta-63.7 \mathrm{ppm}(6 \mathrm{~F})$, corresponding to the two para- $\mathrm{CF}_{3}$ groups.
The ${ }^{19} \mathrm{~F}$ NMR spectrum of a solution of $\mathrm{Ar}{ }_{2} \mathrm{PCl}$ in toluene- $\mathrm{d}_{8}$ was recorded at $-80^{\circ} \mathrm{C}$ and $+95^{\circ} \mathrm{C}$ for comparison with the spectrum at ambient temperature described above.
Values of $\delta 56.9 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 63.9 \mathrm{~Hz}\right)$ were observed at $-80^{\circ} \mathrm{C}$ and $\delta 57.4 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\text {P-F }} 66.6\right.$ Hz ) at $+95^{\circ} \mathrm{C}$. Only very small changes in either chemical shifts or coupling constants for the doublet were noticed, showing that the two Ar" groups remain equivalent over this temperature range
There is no steric hindrance between them. Ar" groups rotate and, due to the perfect symmetry of the molecule, they are always in an equivalent position. This explains why no changes are observed in the spectra.

The ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum was recorded for a $\mathrm{d}_{8}$-toluene solution at room temperature. Table 4.5 shows the assignments of each carbon. This spectrum only exhibits the existence of one type of ipso carbon, confirming that the molecule is perfectly symmetrical.

Figure 4.5: Lettering scheme for carbon atoms in $\mathrm{Ar}{ }^{\prime \prime}{ }_{2} \mathrm{PCl}$

| Carbon | $\delta(\mathrm{ppm})$ | $\mathrm{J}(\mathrm{Hz})$ |
| :---: | :---: | :---: |
| A | 140.3 | $\mathrm{~d},{ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{C}} 56.8$ |
| B | 133.1 | $\mathrm{q},{ }^{2} \mathrm{~J}_{\mathrm{C}-\mathrm{F}} 33.9$ |
| C | 123.7 | $\mathrm{~s}(\mathrm{broad})$ |
| D | 133.1 | $\mathrm{q},{ }^{2} \mathrm{~J}_{\mathrm{C}-\mathrm{F}} 33.9$ |
| E | 129.1 | s |
| F | 123.6 | $\mathrm{~d},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{C}} 1.9$ |
| G | 123.6 | $\mathrm{q},{ }^{1} \mathrm{~J}_{\mathrm{C}-\mathrm{F}} 275.8$ |
| H | 123.4 | $\mathrm{qd},{ }^{1} \mathrm{~J}_{\mathrm{C}-\mathrm{F}} 273.05,{ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{C}} 1.74$ |

Table 4.5: Signal assignments for ${ }^{13} \mathrm{C}$ spectrum of $\mathrm{Ar}{ }^{\prime}{ }_{2} \mathrm{PCl}$

- X-ray crystallography

Crystals were obtained by recrystallisation from hexanes. The structure was determined at 100 K by A.E. Goeta and is shown in Figure 4.6:

Figure 4.6: Molecular structure of $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{PCl}$

Ar" ${ }_{2} \mathrm{PCl}$ crystallises in the monoclinic I2/a space group with $\mathrm{Z}=8$. Selected bond lengths and angles are listed Table 4.6.

| Bond Distances $(\AA)$ |  | Angles $\left(^{\circ}\right)$ |  |
| :---: | :---: | :---: | :---: |
|  |  |  |  |
| $\mathrm{P}(1)-\mathrm{Cl}(1)$ | $2.0619(9)$ | $\mathrm{C}(1)-\mathrm{P}(1)-\mathrm{C}(11)$ | $100.37(10)$ |
| $\mathrm{P}(1)-\mathrm{C}(1)$ | $1.854(2)$ | $\mathrm{C}(1)-\mathrm{P}(1)-\mathrm{Cl}(1)$ | $97.38(7)$ |
| $\mathrm{P}(1)-\mathrm{C}(11)$ | $1.885(2)$ | $\mathrm{C}(11)-\mathrm{P}(1)-\mathrm{Cl}(1)$ | $100.95(7)$ |

Table 4.6: Selected Bond distances ( $\mathcal{A}$ ) and Angles ( ${ }^{\circ}$ ) for $\mathrm{Ar}{ }^{\prime \prime}{ }_{2} \mathrm{PCl}$
$\mathrm{P}-\mathrm{C}$ and $\mathrm{P}-\mathrm{Cl}$ bond distances are similar to those found in $\mathrm{Ar}_{2} \mathrm{PCl}$, although the P-C bonds are slightly longer in $\mathrm{Ar}_{2} \mathrm{PCl}$, due to the steric demand of the four $\mathrm{CF}_{3}$ groups in ortho positions in comparison to only two in $\mathrm{Ar}{ }^{2}{ }_{2} \mathrm{PCl}$. The same feature applies to the C -P-C angles, being $100.37(10)^{\circ}$ in $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{PCl}$ and $109.87(12)^{\circ}$ in $\mathrm{Ar}_{2} \mathrm{PCl}$. Three P---F short contacts are observed: $\mathrm{P}--\mathrm{F}(10) 2.874 \AA, \mathrm{P}--\mathrm{F}(4) 3.048 \AA, \mathrm{P}--\mathrm{F}(5) 3.124 \AA$. The average
atomic distance is $3.015 \AA$, and is shorter than the sum of the van der Waals radii (3.31 A). ${ }^{33}$

### 4.2.2.4 $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PCl}$

Figure 4.7: The Ar'Ar"PCl molecule

This compound was synthesised and crystallised by Roden. ${ }^{21}$ The ${ }^{31} \mathrm{P}$ NMR spectrum showed a complex multiplet at $\delta 67.3 \mathrm{ppm}$, caused by the presence of three ortho- $\mathrm{CF}_{3}$ groups. (Figure 4.8)
The ${ }^{19} \mathrm{~F}$ spectrum for a toluene solution was expected to be composed of two doublets, (one having double intensity) (from the Ar' group) and one singlet. At ambient temperature, however, a doublet at $\delta-59.3 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 59.1 \mathrm{~Hz}\right.$ ) and two singlets (a broad double intensity line at -55.4 ppm and a sharp peak at -64.1 ppm ) were observed (Figure 4.9)

Figure 4.8: ${ }^{31} \mathrm{PNMR}$ spectrum of $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{PCl}$

Figure 4.9: ${ }^{19}$ F NMR spectrum of $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{PCl}$

The ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum was also recorded for a toluene/ $\mathrm{CDCl}_{3}$ solution at ambient temperature. Probable assignments (Figure 4.10) are shown is Table 4.7, though some of these are necessarily tentative. The carbons to which the $\mathrm{CF}_{3}$ groups were attached could not be assigned with confidence, since these signals were of low intensity and were overlapped with stronger signals. The presence of two distinct ipso carbon signals confirms the asymmetric nature of the $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{PCl}$, as does the observation of three different $\mathrm{CF}_{3}$ signals, one of double intensity.

Figure 4.10: Lettering Scheme for Carbon Atoms in Ar ' Ar ' PCl

| Carbon | $\delta$ (ppm) | J (Hz) |
| :---: | :---: | :---: |
| A | 137.6 | d, ${ }^{1}{ }_{\text {P-C }} 67.9$ |
| B | 136.7 | d, ${ }^{1}{ }_{\text {P-C }} 84.0$ |
| C | $132.11^{\text {a }}$ | S |
| D | 131.1 | $s$ (broad, double intensity) |
| E | 134.2 | d, ${ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{C}} 8.7$ |
| F | 128.0 | d, JP-C 3.4 |
| G | 123.7 | $\mathrm{m},{ }^{3} \mathrm{~J}_{\text {P-C }} 5.0$ |
| K | $123.18{ }^{\text {a }}$ | $\mathrm{q},{ }^{1} \mathrm{~J}_{\mathrm{C}-\mathrm{F}} 275.8$ (double intensity) |
| L | $123.24{ }^{\text {a }}$ | $\mathrm{qd},{ }^{1} \mathrm{~J}_{\text {C-F }} 275.5,{ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{C}} 3.4$ |
| M | 123.1 | $\mathrm{q},{ }^{1} \mathrm{~J}_{\text {C-F }} 272.6$ |
| N | $132.06^{\text {a }}$ | m |
| O | 132.3 | m |
| P | 131.8 | m |

Table 4.7: $\delta^{13} \mathrm{C}$ Assignments

[^4]- X-ray Crystallography

The structure was determined by A.S. Batsanov at 150 K and is shown in Figure 4.11. ${ }^{19,21}$ This compound was the first structurally characterised diarylchlorophosphane.

Figure 4.11: Molecular structure of $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{PCl}^{21}$

The P-C and P-Cl bonds distances (P-Cl 2.061(1), P-C(1) 1.875(1), P-C(9) 1.852(1) $\AA$ ) are similar to those found in $\mathrm{Ar}_{2} \mathrm{PCl}$ and $\mathrm{Ar}_{2}{ }_{2} \mathrm{PCl}$. The P-C(1) bond is longer than that for $\mathrm{P}-\mathrm{C}(9)$, reflecting the steric demand of the two $\mathrm{CF}_{3}$ groups in ortho positions of the Ar ' moiety.

The three covalent bonds around the phosphorus have a pyramidal configuration, complemented by two short intramolecular interactions: P---F(1) 2.890(1) $\AA$ and P---F(8) 2.897 (1) $\AA$. Overall, four short P---F distances are found in the range $2.890-3.25 \AA$. These contacts are shorter than the sum of the van der Waals radii of $3.31 \AA .{ }^{33}$

### 4.2.2.5 $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$

Equation 4.7: Synthesis of $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$

A solution of $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ was added to a $\mathrm{PBr}_{3}$ solution in diethyl ether at $-78^{\circ} \mathrm{C}$. The resulting oil was distilled under reduced pressure $\left(\mathrm{Bp} 60^{\circ} \mathrm{C}\right.$ ) to give a yellow oil. The ${ }^{31} \mathrm{P}$ NMR spectrum showed a septet at $\delta 134.1\left({ }^{4} \mathrm{~J}_{\text {P-F }} 62.8 \mathrm{~Hz}\right) \mathrm{ppm}$. The ${ }^{19} \mathrm{~F}$ NMR spectrum consisted of a doublet $\delta-52.9\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 62.8 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right) \mathrm{ppm}$.
4.2.2.6 $\mathrm{Ar}^{\prime} \mathrm{PPBr}_{2}$

Equation 4.8: Synthesis of $\mathrm{Ar}^{\mathrm{P}} \mathrm{PBr}_{2}$

This product could not be separated from the first substitute $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ because of their very close boiling point, caused by their identical molecular mass.
The ${ }^{31} \mathrm{P}$ NMR consisted of a quartet at $141.0\left({ }^{4} \mathrm{~J}_{\text {P.F }} 85.5 \mathrm{~Hz}\right)$. The ${ }^{19} \mathrm{~F}$ NMR showed a doublet at $-56.9\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 85.8 \mathrm{~Hz}, 3 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and a singlet at $-62.8\left(3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.2.2.7 $\mathrm{Ar}{ }_{2} \mathrm{PBr}$

Equation 4.9: Synthesis of $\mathrm{Ar}{ }^{\prime 2}{ }_{2} \mathrm{PBr}$

Two equivalents of the $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime \prime} \mathrm{Li}$ mixture were added to a solution of $\mathrm{PBr}_{3}$ at $-78^{\circ} \mathrm{C}$ to give an brown oil, which was purified by distillation under reduced pressure ( $\mathrm{Bp} 120^{\circ} \mathrm{C}$ ). This afforded a yellow oil, which crystallised on standing.

- NMR spectroscopy

The ${ }^{31} \mathrm{P}$ NMR spectrum showed a doublet at $57.4\left({ }^{4} \mathrm{~J}_{\text {P-F }} 65.8 \mathrm{~Hz}\right) \mathrm{ppm}$ and the ${ }^{19} \mathrm{~F}$ NMR spectrum consisted of a doublet at $-57.7\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 65.8 \mathrm{~Hz}, o-\mathrm{CF}_{3}\right)$ and a singlet at -63.7 (p$\mathrm{CF}_{3}$ ) ppm.

- X-ray crystallography

Crystals were grown by recrystallisation from hexanes. The structure was determined by A.S. Batsanov at 103 K and is shown in Figure 4.12:

Figure 4.12: Molecular structure of $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{PBr}$

Ar" ${ }_{2} \mathrm{PBr}$ crystallises in the monoclinic $12 / \mathrm{a}$ space group with $\mathrm{Z}=8$.
Selected bond distances and angles are listed in Table 4.8:

| Bond Distances $(\AA)$ |  | Angles $\left(^{\circ}\right)$ |  |
| :---: | :---: | :---: | :---: |
|  |  |  | $100.51(8)$ |
| $\mathrm{P}(1)-\mathrm{Br}(1)$ | $2.2340(5)$ | $\mathrm{C}(1)-\mathrm{P}(1)-\mathrm{C}(11)$ | $96.99(6)$ |
| $\mathrm{P}(1)-\mathrm{C}(1)$ | $1.8572(18)$ | $\mathrm{C}(1)-\mathrm{P}(1)-\mathrm{Br}(1)$ | $101.31(6)$ |
| $\mathrm{P}(1)-\mathrm{C}(11)$ | $1.8591(17)$ | $\mathrm{C}(11)-\mathrm{P}(1)-\mathrm{Br}(1)$ |  |

Table 4.8: Selected Bond Distances ( $\AA$ ) and Angles $\left({ }^{\circ}\right)$ for $\mathrm{Ar}{ }^{\prime \prime}{ }_{2} \mathrm{PBr}$

Bond distances and angles are very similar to those found in the analogous compound $\mathrm{Ar}{ }_{2} \mathrm{PCl}$. The $\mathrm{P}-\mathrm{Br}$ bond distance is in the same range as the $\mathrm{P}-\mathrm{Br}$ bond distances found in $\mathrm{ArPBr}_{2} . \mathrm{Ar}_{2}{ }_{2} \mathrm{PCl}$ and $\mathrm{Ar}{ }_{2}{ }_{2} \mathrm{PBr}$ are isostructural.

As in $\mathrm{ArPBr}_{2}$ and $\mathrm{Ar}_{2}{ }_{2} \mathrm{PCl}$, short P---F contacts are found between the phosphorus and three of the fluorine atoms of the ortho $-\mathrm{CF}_{3}$ groups: $\mathrm{P}--\mathrm{F}(4) 3.067 \AA, \mathrm{P}--\mathrm{F}(5) 3.122 \AA$,

P---F(10) $2.887 \AA$, with an interatomic average distance of ca. $3.025 \AA$. This distance is shorter than the sum of the van der Waals radii ( $3.31 \AA$ ) ${ }^{33}$

### 4.2.2.8 $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime}{ }^{\prime} \mathrm{PBr}$

Equation 4.10: Synthesis of Ar'Ar"PBr

This compound was present in solution as a disubstituted product of the reaction between the $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ mixture and $\mathrm{PBr}_{3}$. Distillation under reduced pressure of the solution gave at $120^{\circ} \mathrm{C}$ an oil, which NMR revealed to be a mixture of $\mathrm{Ar}{ }^{\prime}{ }_{2} \mathrm{PBr}$ and $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PBr}$. Although $\mathrm{Ar}{ }^{2}{ }_{2} \mathrm{PBr}$ could be isolated, $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PBr}$ could not.
The ${ }^{31} \mathrm{P}$ NMR exhibited a multiplet ( 13 lines) at 58.9 ppm . The ${ }^{19} \mathrm{~F}$ NMR showed three different signals: a broad singlet at -55.2 (6F,o-CF ${ }_{3}$ in Ar ), a doublet at $-58.8\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 56.6\right.$ $\mathrm{Hz}, 3 \mathrm{~F}, o-\mathrm{CF}_{3}$ in Ar ") and a singlet at $-63.5\left(3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.2.2.9 Ar" ${ }_{2} \mathrm{PH}$

Equation 4.11: Synthesis of $A r{ }^{\prime \prime}{ }_{2} P H$

Ar" ${ }_{2} \mathrm{PH}$ was obtained by reduction of $\mathrm{Ar}{ }_{2} \mathrm{PCl}$ with $\mathrm{LiAlH}_{4}$, yielding a white solid. The ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ spectrum consisted of a septet at $-48.7\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 36.7 \mathrm{~Hz}\right) \mathrm{ppm}$. The
${ }^{31} \mathrm{P},{ }^{1} \mathrm{H}$ coupled spectrum showed a doublet of septets at $-49.0\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 36.8 \mathrm{~Hz},{ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{H}} 270.4\right.$ Hz ) ppm.
The ${ }^{19} \mathrm{~F}$ NMR spectrum exhibited a doublet at $-60.0\left({ }^{4} \mathrm{~J}_{\mathrm{P} . \mathrm{F}} 37.1 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and a singlet at -63.8 (s, 6F, $p-\mathrm{CF}_{3}$ ) ppm.

Four signals were found in the ${ }^{1} \mathrm{H}$ NMR spectrum. These are listed in Table 4.9 below.

Figure 4.13: Lettering Scheme for $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{PH}$

| Hydrogen | $\delta{ }^{1} \mathrm{H}(\mathrm{ppm})$ | $\mathrm{J}(\mathrm{Hz})$ |
| :---: | :---: | :---: |
| Ha | 7.9 | s |
| Hb | 7.7 | $\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 7.8$ |
| Hc | 7.4 | $\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 7.9$ |
| H | 6.2 | doublet, ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{H}} 274.5$ |

Table 4.9: $\delta^{I} H$ assignments for $A r "{ }_{2} P H$

### 4.2.2.10 Ar'Ar'PH

Equation 4.12: Synthesis of $A r^{\prime} A r^{\prime \prime} P H$

Ar'Ar"PH was prepared by reduction of the chloride $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PCl}$ with $\mathrm{LiAlH}_{4}$. The product was isolated as a white solid.
The proton-decoupled ${ }^{31} \mathrm{P}$ NMR spectrum consisted of a multiplet at -67.2 ppm . The proton-coupled ${ }^{31} \mathrm{P}$ NMR spectrum showed a doublet of multiplets at $-67.6\left({ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{H}} 240.7\right.$ $\mathrm{Hz}) \mathrm{ppm}$. The ${ }^{1} \mathrm{~J}_{\mathrm{P} . \mathrm{H}}$ coupling constant is in the same range as the one found in $\mathrm{Ar}^{\prime} \mathrm{PH}_{2}$ $\left({ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{H}} 216.7 \mathrm{~Hz}\right.$ ). ${ }^{21}$
The ${ }^{19} \mathrm{~F}$ NMR spectrum exhibited a broad singlet at -57.7 ppm ( $6 \mathrm{~F}, o-\mathrm{CF}_{3}$ in Ar ), a doublet at $-61.2\left({ }^{4} \mathrm{~J}_{\mathrm{PF}} 43.7 \mathrm{~Hz}, 3 \mathrm{~F}, o-\mathrm{CF}_{3}\right.$ in Ar ") and a singlet at $-63.4\left(3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$. The ${ }^{1} \mathrm{H}$ NMR spectrum confirmed the presence of a P-H bond with a doublet at 5.7 ppm ( ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{H}} 240.4 \mathrm{~Hz}$ ).
Crystals of Ar'Ar"PH were grown by recrystallisation from pentane. Data were collected, but the structure could not be solved.

### 4.2.2.11 Attempted synthesis of Ar'Ar"PF

Equation 4.13: Attempted Synthesis of Ar'Ar"PF
$\mathrm{SbF}_{3}$ was added to a solution of $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{PCl}$ in dichloromethane. No change was observed in the ${ }^{19} \mathrm{~F}$ or ${ }^{34} \mathrm{P}$ NMR spectra, which showed only the presence of the starting material.

### 4.2.2.12 Attempted synthesis of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PF}$

Equation 4.14: Attempted Synthesis of $A r{ }_{2}{ }_{2} P F$
$\mathrm{SbF}_{3}$ was added to a solution of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PCl}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The mixture was stirred for a few days and then refluxed for two weeks. No change was observed in the ${ }^{19} \mathrm{~F}$ or ${ }^{31} \mathrm{P}$ NMR spectra.

The direct fluorination of the chloride derivatives containing two Ar' or Ar" groups does not seem to occur. Roden ${ }^{21}$ noticed the same results with the reaction between $\mathrm{Ar}_{2} \mathrm{PCl}$
and $\mathrm{SbF}_{3}$, where only a very small amount of $\mathrm{Ar}_{2} \mathrm{PF}$ was obtained. The steric hindrance around the $\mathrm{P}-\mathrm{Cl}$ bond, imposed by two fluoromes or fluoroxyl substituents, makes the substitution reactions difficult.

### 4.2.2.13 ArAr' $\mathrm{PCl} / \mathrm{ArAr}{ }^{\prime} \mathrm{PCl}$

Equation 4.15: Synthesis of $\mathrm{ArAr}{ }^{\prime} \mathrm{PCl} / \mathrm{ArAr}{ }^{\prime \prime} \mathrm{PCl}$

The mixture of the chloro-derivatives was obtained by reaction of $\mathrm{Ar}^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ with ArPCl ${ }_{2}$ in an overall 1:1 molar ratio. The mixture was purified by distillation giving a yellow oil, but the compounds could not be separated. Attempted recrystallisation from hexanes afforded a white powder of the mixture.
The ${ }^{31} \mathrm{P}$ NMR spectrum for $\mathrm{ArAr}{ }^{\prime} \mathrm{PCl}$ showed a multiplet at 76.6 ppm . For $\mathrm{ArAr}{ }^{\prime} \mathrm{PCl}$ a multiplet was also observed at 69.9 ppm . Three signals were observed in the ${ }^{19} \mathrm{~F}$ NMR spectrum of ArAr'PCl: two doublets at $-54.1\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 42.1 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and $-54.3\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}\right.$ $\left.42.1 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right) \mathrm{ppm}$, and a singlet at $-64.0\left(3 \mathrm{~F}, p-\mathrm{CF}_{3}\right)$. The ${ }^{19} \mathrm{~F}$ NMR spectrum of ArAr" PCl consisted of a broad signal at $-55.5\left(6 \mathrm{~F}, o-\mathrm{CF}_{3}\right.$ in Ar$)$, a doublet at $-58.6\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}\right.$ $58.3 \mathrm{~Hz}, 3 \mathrm{~F}, o-\mathrm{CF}_{3}$ in Ar ") and two singlets at $-63.6\left(3 \mathrm{~F}, p-\mathrm{CF}_{3}\right)$ and $-64.1\left(3 \mathrm{~F}, p-\mathrm{CF}_{3}\right)$.
This compound is the first synthesised product containing fluoromes and fluoroxyl ligands within the same molecule. The coupling constant in ArAr"PCl is larger than the
one in ArAr'PCl ( ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 42.1 \mathrm{~Hz}$ in ArAr'PCl, 58.1 Hz in ArAr’PCl). This has been observed in the monosubstituted products $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ and $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$, reflecting the fact that one of the $\mathrm{CF}_{3}$ groups in the ortho position interacts more with the phosphorus than the other one.

No evidence was found for the formation of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PX}$. This is probably due to the steric demand of the two Ar ' substituents containing two $\mathrm{CF}_{3}$ groups in ortho position. However, $\mathrm{Ar}_{2} \mathrm{PX}$ has been isolated. In the case of the reaction with $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime \prime} \mathrm{Li}$ the formation of the less sterically hindered products $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PCl}$ and $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PCl}$ is preferred.

### 4.3 Arsenic Derivatives

Only a few arsenic derivatives containing fluoromes ligands have been reported. The first arsenic derivatives prepared were $\mathrm{Ar}_{2} \mathrm{AsF}^{15}$ by reaction of 2 equivalents of ArLi with $\mathrm{AsF}_{3}$. ArAsF was reduced to $\mathrm{Ar}_{2} \mathrm{AsH}$ via $\mathrm{LiAlH}_{4} .15$ More recently $\mathrm{ArAsCl}_{2}{ }^{35}$ and $\mathrm{Ar}_{2} \mathrm{AsCl}^{27}$ were synthesised. $\mathrm{Ar}_{2} \mathrm{AsCl}$ is the only arsenic derivatives containing Ar to be structurally characterised. No examples of fluoroxyl-containing derivatives have been described. Xue ${ }^{36}$ attempted the reaction between $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime \prime} \mathrm{Li}$ and $\mathrm{AsCl}_{3}$, which afforded a mixture of different mono- and di-substituted products. These could not be separated.

A general method has been used in these syntheses with $\mathrm{AsCl}_{3}$ or $\mathrm{AsBr}_{3}$ reacting directly with ArLi or $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ at low temperature with continuous stirring for a few hours.

### 4.3.1 Reaction with 2,4,6-tris(trifluoromethyl)phenyl lithium (ArLi)

4.3.1.1 $\mathrm{ArAsCl}_{2}$

Equation 4.16: Synthesis of $\mathrm{ArAsCl}_{2}$
$\mathrm{ArAsCl}_{2}$ was isolated as a yellow oil and purified by distillation under reduced pressure (Bp $60^{\circ}$ ). The ${ }^{19} \mathrm{~F}$ NMR showed two singlets at $-53.5\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and at -64.2 (3F, $p$ $\mathrm{CF}_{3}$ ) ppm.

### 4.3.1.2 $\quad \mathrm{Ar}_{2} \mathrm{AsCl}$

Equation 4.17: Synthesis of $\mathrm{Ar}_{2} \mathrm{AsCl}$
$\mathrm{Ar}_{2} \mathrm{AsCl}$ is a di-substituted product from the reaction above. It has been isolated as a white solid.
The ${ }^{19} \mathrm{~F}$ NMR consisted of two singlets at $-54.6\left(12 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and at $-63.9\left(6 \mathrm{~F}, p-\mathrm{CF}_{3}\right)$ ppm respectively. The structure of this compound has recently been determined and reported by Burford et al. 22

### 4.3.1.3 $\mathrm{ArAsBr}_{2}$

## Equation 4.18: Synthesis of $\mathrm{ArAsBr}_{2}$

This compound was isolated as a yellow oil after distillation under reduced pressure ( Bp $120^{\circ} \mathrm{C}$ ). Two different singlets were observed in the ${ }^{19} \mathrm{~F}$ NMR spectrum at $-53.2(6 \mathrm{~F}, o-$ $\mathrm{CF}_{3}$ ) and -63.8 (6F, $p-\mathrm{CF}_{3}$ ) ppm.

### 4.3.1.4 $\mathrm{Ar}_{2} \mathrm{AsBr}$

Equation 4.19: Synthesis of $\mathrm{Ar}_{2} \mathrm{AsBr}$
$\mathrm{Ar}_{2} \mathrm{AsBr}$ is the disubstituted compound arising from the reaction of ArLi with $\mathrm{ArBr}_{3}$ in a 2:1 molecular ratio. The compound was separated from $\mathrm{ArAsBr}_{2}$ by distillation ( Bp $150^{\circ} \mathrm{C}$ ). The ${ }^{19} \mathrm{~F}$ NMR spectrum exhibited two singlets at $-54.4\left(12 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and -63.9 ( $6 \mathrm{~F}, p-\mathrm{CF}_{3}$ ) ppm.

### 4.3.1.5 $\mathrm{ArAsH}_{2}$

Equation 4.20: Synthesis of $\mathrm{ArAsH}_{2}$

ArAsH ${ }_{2}$ was prepared by reduction of $\mathrm{ArAsCl}_{2}$ with $\mathrm{LiAlH}_{4}$. This afforded a yellow oil. The ${ }^{19} \mathrm{~F}$ NMR showed two signals: a triplet at $-61.4\left({ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{H}} 6.4 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and singlet at $-64.2\left(3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$. A broad singlet was observed at 6.2 ppm in the ${ }^{1} \mathrm{H}$ NMR spectrum, assigned to the H bonded to As.

### 4.3.1.6 $\quad \mathrm{Ar}_{2} \mathrm{AsH}$

Equation 4.21: Synthesis of $A r_{2} A s H$

Reduction of $\mathrm{Ar}_{2} \mathrm{AsCl}$ by $\mathrm{LiAlH}_{4}$ gave $\mathrm{Ar}_{2} \mathrm{AsH}$ as a colourless oil. The ${ }^{19} \mathrm{~F}$ NMR consisted of a doublet at $-58.7\left({ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{H}} 3.6 \mathrm{~Hz}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and a singlet $-64.2\left(6 \mathrm{~F}, p-\mathrm{CF}_{3}\right)$ ppm . The ${ }^{1} \mathrm{H}$ NMR spectrum showed a broad singlet $\delta-6.4 \mathrm{ppm}$ corresponding to H bonded to As.

These ${ }^{1} \mathrm{H}$ NMR chemicals shifts correspond to those found previously in the literature for for $\mathrm{Ar}_{2} \mathrm{AsH} .{ }^{15}$ Scholz et al reported ${ }^{19} \mathrm{~F}$ NMR data showing a doublet at -64.1 ppm corresponding to the ${ }^{7} \mathrm{~J}$ coupling between the para- $\mathrm{CF}_{3}$ groups and the hydrogen. ${ }^{15}$ This coupling has not been noticed in the present work.

### 4.3.2 Reaction with 2,6-bis(trifluoromethyl)phenyl lithium (Ar'Li) / 2,4bis(trifluoromethyl)phenyl lithium (Ar"Li)

As for phosphorus compounds, the reaction of $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ with $\mathrm{AsCl}_{3}$ can give rise to a mixture of five different products, two monosubstituted ( $\mathrm{Ar}^{\prime} \mathrm{AsCl}_{2}$ and $\mathrm{Ar}^{\prime \prime} \mathrm{AsCl}_{2}$ ) and three disubstituted ( $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{ArCl}, \mathrm{Ar}^{\prime}{ }_{2} \mathrm{AsCl}$ and $\left.\mathrm{Ar}{ }^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}\right)$.
4.3.2.1 $\mathrm{Ar}^{\prime} \mathrm{AsCl}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}_{2}$

Equation 4.22: Synthesis of $\mathrm{Ar}^{\prime} \mathrm{AsCl}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}_{2}$

These two compounds could not be separated by distillation because of their close boiling points. The mixture was isolated as a yellow oil (Bp $115^{\circ} \mathrm{C}$ ). The ${ }^{19} \mathrm{~F}$ NMR spectrum of Ar' $\mathrm{AsCl}_{2}$ consisted of a singlet at -52.9 ( $6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ) ppm; for $\mathrm{Ar}^{\prime \prime} \mathrm{AsCl}_{2}$ it showed two singlets at $-57.7\left(3 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and $-63.7\left(3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.3.2.2 Ar'Ar"AsCl

Equation 4.23: Synthesis of $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}$

Ar'Ar" AsCl was isolated by distillation under vacuum ( $\mathrm{Bp} 150^{\circ} \mathrm{C}$ ), and purified by recrystallisation from n -hexane.

- NMR spectroscopy

The ${ }^{19}$ F NMR spectrum showed a broad singlet at $-54.8 \mathrm{ppm}(6 \mathrm{~F})$, corresponding to the ortho- $\mathrm{CF}_{3}$ groups of the Ar' moiety, a singlet at -58.8 (3F) for the ortho $-\mathrm{CF}_{3}$ of the Ar " substituent and a singlet at -63.5 (3F, $p-\mathrm{CF}_{3}$ ) (Figure 4.14).

Figure 4.14: ${ }^{19} \mathrm{~F}$ NMR spectrum of $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}$
Data for the ${ }^{1} \mathrm{H}$ NMR are listed in Table 4.10.

Figure 4.15: Lettering scheme for $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}$

| Hydrogen | $\delta^{1} \mathrm{H}(\mathrm{ppm})$ | $\mathrm{J}(\mathrm{Hz})$ |

| Hd | 7.26 | $\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 7.6$ |
| He | 7.7 |  |

Table 4.10: $\delta^{l} H$ Assignments

- X-Ray crystallography

Crystals were grown by recrystallisation from hexane. The structure of $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}$ was ascertained by A.E. Goeta at 100 K and is shown in Figure 4.16.

Figure 4.16: Molecular structure of $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}$

Selected bond distances and angles are listed Table 4.11, with those for $\mathrm{Ar}_{2} \mathrm{AsCl}^{22}$ for comparison.

|  | Bond distance $(\AA)$ |  | Angle $\left({ }^{\circ}\right)$ |  |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{Ar}^{\prime} \mathrm{Ar} " \mathrm{AsCl}$ |  |  |  |  |
|  | $\mathrm{As}(1)-\mathrm{Cl}(1)$ | $2.2074(5)$ | $\mathrm{C}(1)-\mathrm{As}(1)-\mathrm{C}(11)$ | $102.98(7)$ |
|  | $\mathrm{As}(1)-\mathrm{C}(1)$ | $1.9880(18)$ | $\mathrm{C}(1)-\mathrm{As}(1)-\mathrm{Cl}(1)$ | $100.08(6)$ |
|  | $\mathrm{As}(1)-\mathrm{C}(11)$ | $2.0182(17)$ | $\mathrm{C}(11)-\mathrm{As}(1)-\mathrm{Cl}(1)$ | $98.84(5)$ |
| $\mathrm{Ar}_{2} \mathrm{AsCl}^{22}$ | $\mathrm{As}(1)-\mathrm{Cl}$ | $2.1920(12)$ | $\mathrm{C}(1)-\mathrm{As}(1)-\mathrm{C}(2)$ | $107.53(16)$ |
|  | $\mathrm{As}(1)-\mathrm{C}(1)$ | $2.023(4)$ | $\mathrm{C}(1)-\mathrm{As}(1)-\mathrm{Cl}(1)$ | $101.3(9)$ |
|  | $\mathrm{As}(1)-\mathrm{C}(2)$ | $2.016(4)$ | $\mathrm{C}(2)-\mathrm{As}(1)-\mathrm{Cl}(1)$ | $88.4(9)$ |

Table 4.11: Selected Bond Distances ( $\AA$ ) and Angles ( ${ }^{\circ}$ ) in $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}$ and $\mathrm{Ar}_{2} \mathrm{AsCl}^{22}$

The As-Cl bond length of $2.2074(5) \AA$ is similar to that in the orthorhombic modification of $\mathrm{Ar}_{2} \mathrm{AsCl}(2.1920(12) \AA),{ }^{22}$ and slightly shorter than in $\mathrm{AsCl}_{3} 37$ or other organoderivatives with one As-Cl bond. ${ }^{38-40}$ The As-C bond lengths are slightly longer in $\mathrm{Ar}_{2} \mathrm{AsCl}$. Angles are also larger in $\mathrm{Ar}_{2} \mathrm{AsCl}$ than in $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{Cl}$, reflecting the greater steric demand of the Ar ligands in comparison to the Ar" substituents.
Some short As---F contacts are found: As---F(5) $2.701 \AA$, As---F(8) $2.851 \AA$, As---F(9) $3.171 \AA$, As---F(11) $3.292 \AA$, with an average interatomic of ca. $3.003 \AA$. This is shorter than the sum of the van der Waals radii of As $(2.00 \AA)$ and $F(1.40 \AA) .41$

### 4.3.2.3 $\mathrm{Ar}^{\prime} \mathrm{AsBr}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{AsBr}_{2}$

Equation 4.24: Synthesis of $\mathrm{Ar}^{\prime} \mathrm{AsBr}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{AsBr}_{2}$

Ar'Li/Ar'Li was added to a solution of $\mathrm{AsBr}_{3}$ in hexanes. The product was purified by distillation under reduced pressure ( 0.01 Torr), and a yellow oil was collected at $81^{\circ} \mathrm{C}$. $\mathrm{Ar}^{\prime} \mathrm{AsBr}_{2}$ and $\mathrm{Ar}^{\prime \prime} \mathrm{AsBr}_{2}$ could not be separated. The ${ }^{19} \mathrm{~F}$ NMR exhibited a singlet at -52.7 ( $6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ) for $\mathrm{Ar}^{\prime} \mathrm{AsBr}_{2}$. For $\mathrm{Ar}^{\prime \prime} \mathrm{AsBr}_{2}$ two singlets were observed at $\delta-58.5\left(3 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and -62.8 (3F, $\left.p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.3.2.4 Ar'Ar"AsBr

Equation 4.25: Synthesis of Ar 'Ar" $^{\prime \prime}$ AsBr
$\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsBr}$ was isolated by distillation $\left(\mathrm{Bp} 110^{\circ} \mathrm{C}\right)$ as a mixture with $\mathrm{Ar}{ }^{\prime}{ }_{2} \mathrm{AsBr}$. The mixture was dissolved in hexanes and left in the freezer where, after a month, crystals of $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsBr}$ appeared.

- NMR spectroscopy

As found in the analogous compound $\mathrm{Ar}^{3} \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}$, three signals were observed in the ${ }^{19} \mathrm{~F}$ NMR spectrum: a broad signal at $-54.9(6 \mathrm{~F})$ corresponding to the ortho $-\mathrm{CF}_{3}$ groups of the Ar ' ligand; the $o-\mathrm{CF}_{3}$ group of the Ar " moiety has a shift of $-58.8(3 \mathrm{~F}) \mathrm{ppm}$, while a singlet at $-63.5(3 \mathrm{~F}) \mathrm{ppm}$ corresponds to the $\mathrm{CF}_{3}$ group in the para position.

- X-ray crystallography

Crystals were formed by recrystallisation from hexanes. The structure was ascertained at 120 K by A.L. Thompson, and is shown in Figure 4.17.

Figure 4.17: Molecular structure of $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsBr}$

The As-Br bond distance of 2.3530 (3) $\AA$ is similar to those found in the literature, lying between the values of $2.31 \AA$ for $\mathrm{AsBr}_{3} 42$ and 2.40 (1) $\AA$ for $\mathrm{Ph}_{2} \mathrm{AsBr} .{ }^{43}$. It is similar to the corresponding bond length in $\mathrm{Mes}_{2} \mathrm{AsBr}$ of 2.34(2) $\AA$ at low temperature and $2.3846(4) \AA$ at higher temperature. ${ }^{44}$

The As-C bond lengths are similar to the ones found in $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}$, and the angles are in the same range too. Four short As---F contacts have been observed in this molecule: As--$-F(16) 2.707 \AA$, As---F(22) $3.277 \AA$, As---F(24) $3.157 \AA$, As---F(26) $2.840 \AA$, with an average interatomic distance of ca. $2.99 \AA$. This is shorter than the sum of the van der Waals radii $(3.40 \AA) .{ }^{41}$ These intramolecular interactions are similar to those found in Ar'Ar" ${ }^{\prime} \mathrm{AsCl}$.
4.3.2.5 $\mathrm{Ar}{ }_{2} \mathrm{AsBr}$

Equation 4.26: Synthesis of $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{AsBr}$
$\mathrm{Ar}{ }_{2}{ }_{2} \mathrm{AsBr}$ is a product of the reaction of two equivalents of the $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime \prime} \mathrm{Li}$ mixture with $\mathrm{AsBr}_{3}$. This compound was obtained in a mixture with $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime}{ }^{\prime}{ }^{\prime} \mathrm{ABr}$. $\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{AsBr}$ was isolated as a yellow oil after recrystallisation of Ar'Ar"AsBr. The ${ }^{19}$ F NMR spectrum showed two singlets at $-58.4\left(6 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and $-63.6\left(6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.3.2.6 Ar'Ar"AsH

## Equation 4.27: Synthesis of $A r$ 'Ar"AsH

Reduction of $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}$ by $\mathrm{LiAlH}_{4}$ afforded a white solid of $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsH}$.

- NMR Spectroscopy

Three signals were observed in the ${ }^{19} \mathrm{~F}$ NMR spectrum: the ortho $-\mathrm{CF}_{3}$ groups of the Ar ' moiety appeared as a broad singlet at $-58.2\left({ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{H}} 7.1 \mathrm{~Hz}, 6 \mathrm{~F}\right) \mathrm{ppm}$. The Ar" substituents showed two different signals, a singlet at $-61.2(3 \mathrm{~F}) \mathrm{ppm}$ corresponding to the ortho $-\mathrm{CF}_{3}$ and a singlet at $-63.8(3 \mathrm{~F})$ ppm assigned to the para $-\mathrm{CF}_{3}$ groups.

Data for the ${ }^{1} \mathrm{H}$ NMR spectrum in $\mathrm{d}_{8}$-toluene are listed in Table 4.12:

Figure 4.18: Lettering scheme for $A r^{\prime} A r$ " $A s H$

| Hydrogen | $\delta^{1} \mathrm{H}(\mathrm{ppm})$ | $\mathrm{J}(\mathrm{Hz})$ |
| :---: | :---: | :---: |
| Ha | 8.06 | $\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 8$ |
| Hb | 7.7 | $\mathrm{t},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 8$ |
| Hc | 6.9 | $\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 7.6$ |
| Hd | 7.4 | $\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 8$ |
| He | 7.9 | s |
| H | 5.99 | broad singlet, As-H |

Table 4.12: $\delta^{\prime} \mathrm{H}$ assignments for $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}$

- X-ray crystallography

Crystals suitable for X-ray diffraction were obtained by sublimation under vacuum. The structure of $\mathrm{Ar}^{\prime} \mathrm{Ar}$ "AsH was determined at 120 K by A.L. Thompson, and is shown in Figure 4.19:

Figure 4.19: Molecular structure of $A r^{\prime} A r{ }^{\prime \prime} A s H$

There are two distinct molecules in each asymmetric unit, one of which has the arsenic disordered over two almost equally-populated sites ( $55 \%$ and $45 \%$ occupation respectively). Data for the non disordered $\mathrm{As}(1)$ atom are quoted in Table 4.13.

| $\operatorname{Bond}$ distance $(\AA)$ |  | Angle $\left(^{\circ}\right)$ |  |
| :---: | :---: | :---: | :---: |
| $\mathrm{As}(1)-\mathrm{H}(11)$ | $1.37(6)$ | $\mathrm{C}(11)-\mathrm{As}(1)-\mathrm{C}(21)$ | $98.11(18)$ |
| $\mathrm{As}(1)-\mathrm{C}(11)$ | $1.980(5)$ | $\mathrm{C}(11)-\mathrm{As}(1)-\mathrm{H}(11)$ | $102(2)$ |
| $\mathrm{As}(1)-\mathrm{C}(21)$ | $1.995(5)$ | $\mathrm{C}(21)-\mathrm{As}(1)-\mathrm{H}(11)$ | $126(2)$ |
| $\mathrm{As}(31)-\mathrm{H}(31)$ | $1.63(12)$ | $\mathrm{C}(31)-\mathrm{As}(31)-\mathrm{C}(41)$ | $96.5(2)$ |
| $\mathrm{As}(31)-\mathrm{C}(31)$ | $2.007(6)$ | $\mathrm{C}(31)-\mathrm{As}(31)-\mathrm{H}(31)$ | $97(4)$ |
| $\mathrm{As}(31)-\mathrm{C}(41)$ | $2.006(6)$ | $\mathrm{C}(41)-\mathrm{As}(31)-\mathrm{H}(31)$ | $94(4)$ |
| $\mathrm{As}(32)-\mathrm{H}(32)$ | $1.42(10)$ | $\mathrm{C}(31)-\mathrm{As}(32)-\mathrm{C}(41)$ | $97.9(2)$ |
| $\mathrm{As}(32)-\mathrm{C}(31)$ | $1.984(5)$ | $\mathrm{C}(31)-\mathrm{As}(32)-\mathrm{H}(32)$ | $94(4)$ |
| $\mathrm{As}(32)-\mathrm{C}(41)$ | $1.983(5)$ | $\mathrm{C}(41)-\mathrm{As}(32)-\mathrm{H}(32)$ | $116(4)$ |

Table 4.13: Selected Bond distances ( $\mathcal{A}$ ) and Angles ( ${ }^{\circ}$ ) for Ar 'Ar"AsH

The As-C distances are similar to those found in the analogous compounds, $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}$ and $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsBr}$, ranging from $1.980(4)$ to $2.007(6) \AA$. It is not possible to be precise about distances and bond angles involving the H atom attached to As. The As(1)- $\mathrm{H}(11)$ bond length is 1.37(6) $\AA$ and in the disordered molecule $1.42(10) \AA$ for $\mathrm{As}(32)-\mathrm{H}(32)$ and 1.63(12) $\AA$ for $\mathrm{As}(31)-\mathrm{H}(31)$. The As-H bond distances found for $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}$ ' AsH are within the range of the values found for some structurally characterised compounds containing an As-H bond: $1.484(18) \AA$ in a primary organoarsine, ${ }^{45} 1.519 \AA$ in $\mathrm{AsH}_{3}, 461.520 \AA$ in $\left[\mathrm{Cp} * \mathrm{Mn}(\mathrm{CO})_{2}\right] \mathrm{AsH}^{47}$ and $1.5(2)$ in $\mathrm{Cp}_{2} \mathrm{Nb}\left(\mathrm{HAsEt}_{2}\right)\left(\mathrm{H}_{3} \mathrm{BAsEt}_{2}\right) .{ }^{48}$ As in $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}$ and $\mathrm{Ar}^{\prime} \mathrm{Ar}$ "AsBr, four short contacts between the As atom and some of the fluorines of
the ortho $-\mathrm{CF}_{3}$ groups are found, lying between 2.934 and $3.186 \AA$ for $\mathrm{As}(1), 2.859$ and $3.326 \AA$ for $\operatorname{As}(31)$, and between 2.880 and $3.247 \AA$ for $\operatorname{As}(32)$.

### 4.4 Antimony and bismuth derivatives

Although the chemistry of low-coordinate phosphorus and arsenic is well developed, it has been little extended to low-coordinate organo-antimony or bismuth compounds. Only two Sb derivatives containing the fluoromes ligand are known: $\mathrm{ArSbCl}_{2} 14,22,49$ and $\mathrm{Ar}_{2} \mathrm{SbCl} .{ }^{22}$ The bismuth atom has proved large enough to be able to bear three aryl rings; $\mathrm{Ar}_{2} \mathrm{BiCl}^{23}$ and $\mathrm{Ar}_{3} \mathrm{Bi}^{23}$ have been reported.

### 4.4.1 Antimony derivatives

The $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}$ 'Li mixture was added to a solution of $\mathrm{SbCl}_{3}$ in hexanes at room temperature in a $2: 1$ molecular ratio. Solution-state spectroscopy showed a mixture of five different products, which was separated by distillation under reduced pressure.
4.4.1.1 $\mathrm{Ar}^{\prime} \mathrm{SbCl}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{SbCl}_{2}$

Equation 4.28: Synthesis of $\mathrm{Ar}^{\prime} \mathrm{SbCl}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{SbCl}_{2}$

An orange oil was collected at $95^{\circ} \mathrm{C}$. The ${ }^{19} \mathrm{~F}$ NMR spectrum showed the presence of two products, which could not be separated. $\mathrm{Ar}^{\prime} \mathrm{SbCl}_{2}$ exhibited a singlet at $\delta-53.2\left(6 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ ppm . The spectrum of $\mathrm{Ar}^{\prime} \mathrm{SbCl}_{2}$ showed two singlets at $\delta-54.9\left(3 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and $-63.6(3 \mathrm{~F}$, $p-\mathrm{CF}_{3}$ ) ppm.

### 4.4.1.2 $\mathrm{Ar}{ }^{\prime}{ }_{2} \mathrm{SbCl} / \mathrm{Ar}{ }_{2}{ }_{2} \mathrm{SbCl}$

Equation 4.29: Synthesis of $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SbCl} / \mathrm{Ar}{ }^{2}{ }_{2} \mathrm{SbCl}$

Another fraction was collected at $120^{\circ} \mathrm{C}$ as a yellow oil. This oil was dissolved in hexanes and cooled down to $-30^{\circ} \mathrm{C}$ overnight. A white solid formed. The ${ }^{19} \mathrm{~F}$ NMR spectrum of this solid showed the presence of two products.
A singlet at $-55.1\left(12 \mathrm{~F}, o-\mathrm{CF}_{3}\right) \mathrm{ppm}$ was observed for $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SbCl}$. Two other singlets were found at $-58.4\left(6 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$ and $-63.7\left(6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$, assigned to $\mathrm{Ar}{ }_{2} \mathrm{SbCl}$.

### 4.4.1.3 Ar'Ar" ${ }_{2} \mathrm{Sb}$

Equation 4.30: Synthesis of $A r^{\prime} A r{ }^{\prime}{ }_{2} S b$
$\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{Sb}$ appeared as a sticky solid, which was purified by recrystallisation from dichloromethane. This is the first antimony compound containing three fluoroxyl ligands prepared so far.

- NMR spectroscopy

The ${ }^{19} \mathrm{~F}$ NMR spectrum exhibited three singlets at -55.5 ( $6 \mathrm{~F}, o-\mathrm{CF}_{3}$ in Ar ), $-58.4(\mathrm{~s}, 6 \mathrm{~F}$, $o-\mathrm{CF}_{3}$ in $\mathrm{Ar}^{\prime \prime}$ ) and -63.6 (s, 6F, $p-\mathrm{CF}_{3}$ ) ppm.
Variable temperature ${ }^{19} \mathrm{~F}$ NMR spectra were recorded at $-50^{\circ} \mathrm{C}$ and $100^{\circ} \mathrm{C}$, but no change was observed within the temperature range. As discussed for $\mathrm{Ar}^{\prime}{ }_{3} \mathrm{~B}$ (Chapter 2), any exchange probably occurs at a lower temperature. Because of solvent restrictions, a lower range of temperatures could not be run.

A ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectrum was recorded in $\mathrm{d}_{8}$-toluene. Data are quoted in Table 4.14

Figure 4.20: Lettering scheme for $A r^{\prime} A r{ }^{\prime \prime}{ }_{2} S b$

| Carbon | $\delta$ (ppm) | J (Hz) |
| :---: | :---: | :---: |
| A | 139.9 | broad singlet |
| B | 142.8 | broad singlet, double intensity |

Table 4.14: $\delta^{13} \mathrm{C}$ for $\mathrm{Ar}{ }^{\prime} A r^{\prime \prime}{ }_{2} \mathrm{Sb}$

- X-ray crystallography

Crystals of $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime}{ }_{2} \mathrm{Sb}$ were obtained by recrystallisation from dichloromethane. The structure was determined at 120 K by A.E. Goeta, and is shown in Figure 4.21:

Figure 4.21: Molecular structure of $A r^{\prime} A r^{\prime \prime}{ }_{2} S b$

The molecule crystallises in the monoclinic $\mathrm{P} 2(1) / \mathrm{c}$ space group with $\mathrm{Z}=4$. The Sb atom exhibits a trigonal geometry with the $\mathrm{C}-\mathrm{Sb}-\mathrm{C}$ angles ranging from 92.46 (10) to $108.31(10)^{\circ}$. This difference $\left(\sim 16^{\circ} \mathrm{C}\right)$ is probably due to the unsymmetrical character of Ar'Ar" ${ }_{2} \mathrm{Sb}$ and the presence of bulky $\mathrm{CF}_{3}$ groups in the ortho position. The $\mathrm{C}-\mathrm{Sb}-\mathrm{C}$ bond angles for triaryl antimony compounds described in the literature, range from $105.3^{\circ}$ in $\mathrm{Mes}_{3} \mathrm{Sb},{ }^{50} 104.7^{\circ}$ in (2,6-dimethylphenyl) $)_{3} \mathrm{Sb}, 5197.3^{\circ}$ in ( $p$-toly) $)_{3} \mathrm{Sb}, 5297.4^{\circ}$ in ( $o$ tolyl) $)_{3} \mathrm{Sb},{ }^{53}$ to $95^{\circ}$ in $\mathrm{Ph}_{3} \mathrm{Sb} .{ }^{54}$ Asymmetry in the bond angle was observed, which seems to occur with the $\mathrm{Ar}, \mathrm{Ar}^{\prime}$ or Ar " substituents. This can be explained by the presence of short $\mathrm{Sb}--\mathrm{F}$ contacts between the fluorine of the $\mathrm{CF}_{3}$ in the ortho position and the central Sb atom. Three intramolecular interactions are observed (Table 4.15) with an interatomic
average distance of ca. $2.94 \AA$, which is shorter than the sum of the van der Waals radii of $3.74 \AA .41$ These values are similar to those found in $\mathrm{Ar}_{2} \mathrm{SbCl}^{22}$

The geometry of the antimony atom (sum of the bond angles at $\mathrm{Sb}: 296.03^{\circ}$ ) is comparable to those observed in $\mathrm{Ar}_{2} \mathrm{SbCl}^{22}$ and $\mathrm{SbAr}_{2} \mathrm{OSO}_{2} \mathrm{CF}_{3} 22$ (where the sums of the bonds angles are 296.7 and $287.8^{\circ}$ respectively).
Two of the $\mathrm{Sb}-\mathrm{C}(\mathrm{Sb}(1)-\mathrm{C}(21) 2.184(3)$ and $\mathrm{Sb}(1)-\mathrm{C}(11) 2.194(3) \AA)$ bond distances are shorter than those found in $\mathrm{Ar}_{2} \mathrm{SbCl}$ and $\mathrm{SbAr}_{2} \mathrm{OSO}_{2} \mathrm{CF}_{3} .{ }^{22}$ This is due to smaller steric demand of the Ar " groups in comparison with the Ar substituents. The third $\mathrm{Sb}(1)-\mathrm{C}(1)$ bond length is longer due to the presence of trifluoromethyl groups in the ortho position. The average $\mathrm{Sb}-\mathrm{C}$ distances in tris(2,6-dimethylphenyl)stibine is $2.190 \AA{ }^{51} . \mathrm{Sb}-\mathrm{C}$ distances are longer than in $\mathrm{Ph}_{3} \mathrm{Sb}$ (average $2.155(9) \AA$ ), probably as a result of steric interactions with the $o-\mathrm{CF}_{3}$.

### 4.4.2 Bismuth derivatives

Several attempts have been made to react the $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime \prime} \mathrm{Li}$ mixture with $\mathrm{BiCl}_{3}$. The ${ }^{19} \mathrm{~F}$ NMR spectrum showed the presence of different products in solution. Unfortunately, none has been separated from the mixture. It was difficult to assign any peak in the spectrum.

### 4.5 Discussion

### 4.5.1 Solution-state NMR spectroscopy

${ }^{19} \mathrm{~F}$ NMR and ${ }^{31} \mathrm{P}$ NMR data for all phosphorus compounds are listed in Table 4.16.
${ }^{19} \mathrm{~F}$ NMR chemical shifts are similar for all compounds containing the same Ar (or Ar ' or Ar") substituents. However, a slight shielding is observed for the hydride derivatives where the shifts of the ortho $-\mathrm{CF}_{3}$ groups of the Ar" moiety are -60.0 ppm in $\mathrm{Ar}{ }_{2}{ }_{2} \mathrm{PH}$ and -61.2 ppm in $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PH}$, being between -56.5 and -59.3 ppm for the other derivatives containing an Ar" substituent. The shielding is more noticeable in the ${ }^{31} \mathrm{P}$ NMR spectrum: 57.4 ppm for $\mathrm{Ar}{ }^{2}{ }_{2} \mathrm{PBr}$ and -48.7 ppm for $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PH}$.

The same shielding effect is observed in arsenic derivatives in the ${ }^{19} \mathrm{~F}$ NMR data (Table 4.17). For example, the chemical shifts for the $\mathrm{CF}_{3}$ groups in the ortho position are -53.5 ppm in $\mathrm{ArAsCl}_{2}$ and -61.4 ppm in $\mathrm{ArAsH}_{2}$. In the room temperature ${ }^{19} \mathrm{~F}$ NMR spectra of all compounds containing one Ar" substituent and one Ar or Ar' substituent, a broad, unresolved resonance occurred for the two ortho- $\mathrm{CF}_{3}$ groups of the Ar or Ar' moiety. Similar observations have been previously reported for $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{PCl},{ }^{19} \mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime} \mathrm{PFF}^{20}$ and Cp*ArPCl, 55 with ${ }^{4} \mathrm{~J}_{\mathrm{PF}}$ not resolved, although interestingly a ${ }^{4} \mathrm{~J}_{\mathrm{PF}}$ value of 31.6 Hz was recorded for $\mathrm{Cp}^{*} \mathrm{ArPH}$. These results suggest that there is a rotational barrier present in the more sterically hindered species. A detailed temperature-dependence study for some $P$ and As derivatives, will be described in Chapter 5.

Table 4.17: $\delta^{19} F$ chemicals shifts of arsenic compounds.

### 4.5.2 X-ray Crystallography

Table 4.18 lists selected bond distances and angles for phosphorus compounds. The P-C bond lengths are all similar in $\mathrm{Ar}^{2}{ }_{2} \mathrm{PCl}$ and $\mathrm{Ar}{ }_{2}{ }_{2} \mathrm{PBr}$. They are slightly longer in $\mathrm{Ar}_{2} \mathrm{PCl}$ and $\mathrm{ArPBr}_{2}$, due to the presence of two ortho $-\mathrm{CF}_{3}$ groups instead of one in the $\mathrm{Ar}{ }_{2} \mathrm{PX}$ compounds.

A marked asymmetry in the $\mathrm{C}-\mathrm{P}-\mathrm{Cl}$ bond angles is noticed in $\mathrm{Ar}_{2} \mathrm{PCl}$ (they differ by more than $10^{\circ}$ ), which is almost certainly due to the $\mathrm{P}-\mathrm{-F}$ secondary interactions. Only minor
differences in the C-P-X ( $\mathrm{X}=\mathrm{Cl}$ or Br ) angles are apparent for the less sterically hindered compounds $\mathrm{Ar}{ }_{2} \mathrm{PCl}, \mathrm{Ar}{ }_{2} \mathrm{PBr}, \mathrm{Ar}{ }^{\prime} \mathrm{Ar}^{\prime} \mathrm{PCl}^{19}$ with a maximum value of ca. $4.6^{\circ}$ in $\mathrm{Ar}{ }_{2} \mathrm{PBr}$.

Disorder was found for the para- $\mathrm{CF}_{3}$ groups in $\mathrm{ArPBr}_{2}$ and $\mathrm{Ar}{ }_{2} \mathrm{PBr}$. This is often observed in compounds containing these substituents, for example in $\mathrm{Ar}_{2} \mathrm{AsCl}^{22}$, $\mathrm{Ar}_{2} \mathrm{SbCl}^{22}, \mathrm{Ar}_{2} \mathrm{BiCl}^{23}$ and $\mathrm{Ar}_{3} \mathrm{Bi}^{23}$

Data for arsenic derivatives $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}, \mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsBr}$ and $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsH}$ are quoted in Table 4.19. The As-C distances are similar in all instances, ranging from 1.980(4) to 2.007(6) A

The As-X distances are in the range of those reported in the literature for similar compounds.
Phosphorus or arsenic derivatives exhibit a pyramidal geometry around the central atom, with the sum of the bond angles ranging from 298.7 to $310.53^{\circ}$

Table 4.19: Selected Bond Distances ( $\AA$ ) and Angles $\left(^{\circ}\right)$ for Arsenic Compounds

* Data for As(1)

Secondary interactions between the group 15 elements and some of the fluorines of the ortho- $\mathrm{CF}_{3}$ groups are found in all the compounds. This was observed previously in $\mathrm{Ar}_{2} \mathrm{AsCl}, \mathrm{Ar}_{2} \mathrm{SbCl}$ and $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PCl}$. These short E---F contacts are given in Table 4.20. At least three such interactions are observed for six fluorines in $o-\mathrm{CF}_{3}$ groups, four for nine fluorines and five for the only example studied with twelve fluorines $\left(\mathrm{Ar}_{2} \mathrm{PCl}\right)$. The distances are shorter in all instances than the sum of the van der Waals radii. These secondary interactions play a vital role in the stabilisation of the molecule. They are also probably responsible of the large asymmetry found in the $\mathrm{C}-\mathrm{E}-\mathrm{Cl}$ angles in $\mathrm{Ar}_{2} \mathrm{ECl}$. Similar interactions for fluorines from ortho- $\mathrm{CF}_{3}$ groups in Ar ligands have also been reported with transition metals $\mathrm{V},{ }^{56} \mathrm{Cr},{ }^{18,57}$ and Mo. ${ }^{18}$

### 4.6 Experimental

### 4.6.1 Introduction

- NMR spectroscopy

The ${ }^{31} \mathrm{P}$ NMR spectra of phosphorus-containing starting materials were checked, to confirm the absence of any major impurities. ${ }^{19} \mathrm{~F}$ NMR spectra were recorded on a Varian Mercury 200, Varian VXR 400, or Varian Inova 500 Fourier-transform spectrometer at 188.18, 376.35 , and 470.26 MHz respectively. ${ }^{31} \mathrm{P}$ NMR spectra were recorded on the same instruments at $80.96,161.91$ or $202.32 \mathrm{MHz} .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on the Varian VXR 400 instrument at 400 and 100.57 MHz respectively. Chemical shifts were measured relative to external $\mathrm{CFCl}_{3}\left({ }^{19} \mathrm{~F}\right)$ or $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}\left({ }^{31} \mathrm{P}\right)$, with the higher frequency direction taken as positive.

- X-ray crystallography

Single crystal X-ray diffraction experiments were carried out at low temperature, 100 to 120 K , using graphite monochromated $\mathrm{Mo} \mathrm{K} \alpha$ radiation ( $\lambda=0.71073$ ) on a Bruker SMART (CCD 1 K area detector) diffractometer equipped with a Cryostream $\mathrm{N}_{2}$ flow cooling device. ${ }^{58}$ Series of narrow $\omega$-scans $\left(0.3^{\circ}\right)$ were performed at several $\varphi$-settings in such a way as to cover a sphere of data to a maximum resolution between 0.70 and 0.77 $\AA$. Cell parameters were determined and refined using the SMART software, ${ }^{59}$ and raw frame data were integrated using the SAINT program. ${ }^{60}$ The structures were solved by direct methods and refined by full-matrix least squares on $\mathrm{F}^{2}$ using SHELXTL software. ${ }^{61}$

The reflection intensities were corrected by numerical integration based on measurements and indexing of the crystal faces for $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PBr}$ and $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}$ (using SHELXTL software). ${ }^{61}$ For the remaining structures, the absorption corrections were carried out by the multi-scan method, based on multiple scans of identical and Laue equivalent reflections (using the SADABS software). ${ }^{62}$

Non-hydrogen atoms were refined anisotropically, except in some cases where there was disorder (see Results and Discussion). For structures $\mathrm{ArPBr}_{2}, \mathrm{Ar}^{\prime}{ }_{2} \mathrm{PCl}$ and Ar'Ar"AsCl the hydrogen atoms were found in difference Fourier maps and in the case of $\mathrm{ArPBr}_{2}$ constrained accordingly. For structures $\mathrm{Ar}_{2} \mathrm{PCl}, \mathrm{Ar}_{2}{ }_{2} \mathrm{PCl}$ and $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsBr}$, the hydrogen atoms were positioned geometrically and refined using a riding model. In the special case of Ar'Ar'AsH, the hydrogen atoms were found in the Fourier difference map, one constrained and the other allowed to refine freely. The remaining hydrogen atoms were positioned geometrically and refined using a riding model

### 4.6.2 $\mathbf{S y n t h e s i s}$ of $\mathbf{A r P C l}_{\mathbf{2}}$

An $\operatorname{ArLi}$ ( $150 \mathrm{ml}, 80 \mathrm{mmol}$ ) solution in diethyl ether was added dropwise over 20 minutes to a $\mathrm{PCl}_{3}(7 \mathrm{ml}, 80 \mathrm{mmol})$ solution in diethyl ether at $-78^{\circ} \mathrm{C}$. A precipitate of LiCl formed. The solution was allowed to warm to room temperature and stirred for 5 hours. The solution was filtered and the solvents and excess $\mathrm{PCl}_{3}$ were removed under vacuum, leaving a yellow oil, which was distilled under reduced pressure ( 0.02 Torr) giving a colourless solution $\left(\mathrm{Bp} 60^{\circ} \mathrm{C}\right)$.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 145.6$ (septet, $\left.{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 61.3 \mathrm{~Hz}\right) \mathrm{ppm} ;{ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-53.3(\mathrm{~d}$, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 61.3 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), $-64.2\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.6.3 Synthesis of $\mathbf{A r}_{2} \mathbf{P C l}$

A solution of $\mathrm{ArLi}(100 \mathrm{ml}, 48 \mathrm{mmol})$ was added dropwise to a solution of $\mathrm{PCl}_{3}(2.09 \mathrm{ml}$, 24 mmol ) in diethyl ether at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature and stirred for 2 hours. A white precipitate of LiCl appeared. The solution was filtered and the solvents and excess $\mathrm{PCl}_{3}$ were removed under vacuum, leaving a yellow oil, which was distilled under reduced pressure ( 0.01 Torr). Fractions were collected at $60^{\circ} \mathrm{C}\left(\mathrm{ArPCl}_{2}\right)$ and $100^{\circ} \mathrm{C}\left(\mathrm{Ar}_{2} \mathrm{PCl}\right)$. Crystals were grown by recrystallisation from dichloromethane.

Elemental Analysis for $\mathrm{C}_{18} \mathrm{H}_{4} \mathrm{ClF}_{18} \mathrm{P}$ (628.5), Calc: C 34.36, H $0.60 \%$, Found C 34.1, H 0.60 \%.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 74.9$ (multiplet, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 41.9 \mathrm{~Hz}$ ) ppm; ${ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-54.4$ (d, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 41.2 \mathrm{~Hz}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), $\delta-64.1\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.6.4 Synthesis of $\mathbf{A r P B r}_{2}$

A solution of $\mathrm{ArLi}(100 \mathrm{ml}, 48 \mathrm{mmol})$ was added to a $\mathrm{PBr}_{3}(2.25 \mathrm{ml}, 24 \mathrm{mmol})$ solution in diethyl ether ( 100 ml ) at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature and stirred for 2 hours. A white precipitate of LiBr appeared. The solution was filtered
and the solvents and excess $\mathrm{PBr}_{3}$ were removed in vacuo, leaving an orange oil. This oil was distilled under reduced pressure ( 0.03 Torr), giving colourless crystals. Yield (based on ArH$): 4.80 \mathrm{~g}(20.3 \%)$.

Elemental Analysis for $\mathrm{C}_{9} \mathrm{H}_{2} \mathrm{Br}_{2} \mathrm{~F}_{9} \mathrm{P}$ (472), Calc: $\mathrm{C} 22.88, \mathrm{H} 0.4 \%$; Found: C 22.76, H $0.45 \%$.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 130.1$ (septet, $\left.{ }^{4} \mathrm{~J}_{\text {P-F }} 62.3 \mathrm{~Hz}\right) \mathrm{ppm} ;{ }^{19} \mathbb{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-53.1$ (doublet, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 62.4 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), $\delta-64.1$ (s, $3 \mathrm{~F}, p-\mathrm{CF}_{3}$ ) ppm.

### 4.6.5 Synthesis of $\mathbf{A r} \mathbf{P C l}_{\mathbf{2}} / \mathbf{A r}{ }^{\prime} \mathbf{P C l}_{\mathbf{2}}$

The $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime \prime} \mathrm{Li}(96 \mathrm{mmol})$ solution was added dropwise over 20 min to a solution of $\mathrm{PCl}_{3}(25.2 \mathrm{~g}, 16 \mathrm{ml}, 96 \mathrm{mmol})$ in diethyl ether $(100 \mathrm{ml})$ at $-78{ }^{\circ} \mathrm{C}$. This solution was allowed to warm to room temperature and stirred for 4 hours. A white solid of LiCl appeared. The solution was filtered and solvent and $\mathrm{PCl}_{3}$ in excess were removed in vacuo giving a brown oil. The product was purified by distillation under vacuum ( Bp $86^{\circ} \mathrm{C}, 0.01$ Torr). Yield (based on Ar'H): 15.7 g ( $52.1 \%$ ).
${ }^{31} \mathbf{P} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right): \underline{\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}} 8148.4 \mathrm{ppm}\left(\right.$ septet, $\left.{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 61.3\right), \underline{\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}} 8151.6\left(\mathrm{q}^{4}{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 83.8\right)$; ${ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right)$ Ar' $^{\prime} \mathrm{PCl}_{2} \delta-53.2\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 61.3,6 \mathrm{~F}, o-\mathrm{CF}_{3}\right), \underline{\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}}:, \delta-56.5\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}\right.$ 83.8, 3F, $o-\mathrm{CF}_{3}$ ), $\delta-63.6$ (singlet, 3F, $p-\mathrm{CF}_{3}$ ).

### 4.6.6 Synthesis of Ar" ${ }_{2} \mathbf{P C l}$

A solution of $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}^{\prime \prime} \mathrm{Li}(100 \mathrm{ml}, 162 \mathrm{mmol})$ in diethyl ether was added dropwise over 20 min to a solution of $\mathrm{PCl}_{3}(25.2 \mathrm{~g}, 16 \mathrm{ml}, 96 \mathrm{mmol})$ in diethyl ether $(100 \mathrm{ml})$ at $-78^{\circ} \mathrm{C}$. This solution was allowed to warm to room temperature and stirred for 4 hours. A white precipitate of LiCl appeared. The solution was filtered through a fine sinter, and solvent and $\mathrm{PCl}_{3}$ in excess were removed in vacuo, giving a brown oil. The product was purified by distillation under vacuum ( 0.02 Torr), and two different fractions were collected at $86^{\circ} \mathrm{C}\left(\mathrm{Ar}^{\prime} \mathrm{PCl}_{2} / \mathrm{Ar}^{\prime} \mathrm{PCl}_{2}\right)$ and $140^{\circ} \mathrm{C}\left(\mathrm{Ar}{ }_{2} \mathrm{PCl}\right)$. Crystals were grown in hexanes. Yield (based on Ar'H) 11.68 g ( $25 \%$ ).

Elemental Analysis for $\mathrm{C}_{16} \mathrm{H}_{6} \mathrm{ClF}_{12} \mathrm{P}$ (492.5), Calc: C 38.97, H 1.22\%; Found: C 38.96, H $1.35 \%$.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 68.3$ (septet, $\left.{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 65.5 \mathrm{~Hz}\right) \mathrm{ppm} ;{ }^{19} \mathrm{~F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-57.3\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}\right.$ $65.8 \mathrm{~Hz}, 6 \mathrm{~F}, \mathrm{o}-\mathrm{CF}_{3}$ ), $-63.7\left(\mathrm{~s}, 6 \mathrm{~F}, \mathrm{p}-\mathrm{CF}_{3}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{C}_{7} \mathrm{D}_{8}\right): 8140.3\left(\mathrm{~d},{ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{C}} 56.8 \mathrm{~Hz}\right)$, $133.1\left(\mathrm{q},{ }^{2} \mathrm{~J}_{\mathrm{F}-\mathrm{C}} 33.9 \mathrm{~Hz}\right.$ ), 133.1 ( $\mathrm{q},{ }^{2} \mathrm{~J}_{\mathrm{F}-\mathrm{C}} 33.9 \mathrm{~Hz}$ ), 129.1 ( s ), 123.7 (broad singlet), 123.6 (d, $\left.{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{C}} 1.9 \mathrm{~Hz}\right), 123.6\left(\mathrm{q},{ }^{1} \mathrm{~J}_{\mathrm{C}-\mathrm{F}} 275.8 \mathrm{~Hz}\right), 123.4\left(\mathrm{qd},{ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{C}} 273.1 \mathrm{~Hz},{ }^{3} \mathrm{~J}_{\mathrm{C}-\mathrm{F}} 1.74 \mathrm{~Hz}\right) \mathrm{ppm}$.

### 4.6.7 Synthesis of $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$, and $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PBr} / \mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PBr}$

A solution of $\mathrm{Ar} r^{\prime} \mathrm{Li} / \mathrm{Ar}^{\prime \prime} \mathrm{Li}(100 \mathrm{ml})$ was added slowly to a $\mathrm{PBr}_{3}(8 \mathrm{ml}, 85 \mathrm{mmol})$ solution in diethyl ether ( 100 ml ) at $-78^{\circ} \mathrm{C}$. The solution was allowed to warm to room temperature and stirred for 5 hours. A white precipitate of LiBr appeared. The solution was filtered and the solvents and excess $\mathrm{PBr}_{3}$ were removed in vacuo, leaving a brown oil. This oil was distilled under reduced pressure ( 0.01 Torr), and fractions were collected at $60^{\circ} \mathrm{C}\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)$ and $120^{\circ} \mathrm{C}\left(\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PBr} / \mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PBr}\right)$. Yield of $\mathrm{Ar}{ }_{2} \mathrm{PBr}$ :(based on $\left.\mathrm{Ar}{ }^{\prime} \mathrm{H}\right): 4.52 \mathrm{~g}(9 \%)$. It proved possible to isolate $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PBr}$ but not $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}^{\prime} \mathrm{PBr}$.
Elemental Analysis for $\mathrm{C}_{16} \mathrm{H}_{6} \mathrm{BrF}_{12} \mathrm{P}$ (537), Calc: C 35.78, H 1.13 \%; Found: C 35.69, H $1.15 \%$.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \underline{\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}}: \delta 134.1$ (septet, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 62.8 \mathrm{~Hz}$ ) ppm; $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}: \delta 141.0\left(\mathrm{q}_{2}{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}\right.$ 85.5 Hz ); $\mathrm{Ar}_{2}{ }_{2} \mathrm{PBr} \delta 57.4$ (septet, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 65.8 \mathrm{~Hz}$ ) ppm; $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PBr} \delta 58.9 \mathrm{ppm}(\mathrm{m}) \mathrm{ppm}_{;}{ }^{19} \mathrm{~F}$

### 4.6.10 Attempted synthesis of $\mathbf{A r}{ }_{2} \mathbf{P F}$

$\mathrm{SbF}_{3}(0.35 \mathrm{~g}, 1.9 \mathrm{mmol})$ was added to a solution of $\mathrm{Ar}{ }_{2}{ }_{2} \mathrm{PCl}(0.78 \mathrm{~g}, 1.5 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The mixture was stirred for a few days and then refluxed for two weeks. No change was observed in the ${ }^{19} \mathrm{~F}$ and ${ }^{31} \mathrm{P}$ NMR spectra.

### 4.6.11 Attempted synthesis of Ar'Ar"PF

$\mathrm{SbF}_{3}(0.27 \mathrm{~g}, 1.5 \mathrm{mmol})$ was added to a solution of $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime}{ }^{\prime} \mathrm{PCl}(0.52 \mathrm{~g}, 1.04 \mathrm{mmol})$ in dichloromethane. The solution was stirred at room temperature for a few days and then refluxed for a week. No change was observed in the ${ }^{19} \mathrm{~F}$ and ${ }^{31} \mathrm{P}$ NMR spectra.

### 4.6.12 Synthesis of ArAr'PCI/ArAr"PCl

A solution of $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime \prime} \mathrm{Li}(20 \mathrm{ml}, 6.6 \mathrm{mmol})$ was added dropwise to a solution of $\mathrm{ArPCl}_{2}$ $(2.52 \mathrm{~g}, 6.6 \mathrm{mmol})$ in diethyl ether. A precipitate of LiCl immediately formed. The solution was filtered and distilled under reduced pressure ( 0.01 Torr), giving a yellow oil, $\left(\mathrm{Bp} 110^{\circ} \mathrm{C}\right)$.
${ }^{19}$ F NMR $\left(\mathrm{CDCl}_{3}\right):$ ArAr'PCl: $\delta-54.1\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 42.1 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-54.3\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 42.1 \mathrm{~Hz}\right.$, $6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), -64 (s, 3F, $p-\mathrm{CF}_{3}$ ) ppm; ArAr" $\mathrm{PCl}: \delta-55.5$ (broad singlet, $6 \mathrm{~F}, o-\mathrm{CF}_{3}$ in Ar ), $-58.6\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 58.3 \mathrm{~Hz}, 3 \mathrm{~F}, o-\mathrm{CF}_{3}\right.$ in Ar "), $-63.6\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right),-64.1\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$; ${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \underline{\operatorname{ArAr}}{ }^{\prime} \mathrm{PCl}: \delta 76.6(\mathrm{~m}) \mathrm{ppm} ; \underline{\mathrm{ArAr}}{ }^{\mathrm{PCl}} \delta 69.9(\mathrm{~m}) \mathrm{ppm}$.

### 4.6.13 Synthesis of $\mathbf{A r A s C l}_{2} / \mathbf{A r}_{2} \mathbf{A s C l}$

A diethyl ether solution of $\operatorname{ArLi}(100 \mathrm{ml}, 35 \mathrm{mmol})$ was added dropwise to an $\mathrm{AsCl}_{3}$ $(6.45 \mathrm{~g}, 3 \mathrm{ml}, 35 \mathrm{mmol})$ solution in diethyl ether $(50 \mathrm{ml})$ at $-78^{\circ} \mathrm{C}$. The solution was left to warm to room temperature and stirred for four hours. A white precipitate of LiCl
appeared. The solution was filtered and solvent and excess $\mathrm{AsCl}_{3}$ were removed under vacuum, leaving a yellow solution and a white solid. The solution was filtered and distilled under reduced pressure ( 0.02 Torr), giving a yellow oil of $\mathrm{ArAsCl}_{2}, \mathrm{Bp} 60^{\circ} \mathrm{C}$. The white solid was washed twice with diethyl ether and dried under vacuum $\left(\mathrm{Ar}_{2} \mathrm{AsCl}\right)$. The solid was purified by recrystallisation from dichloromethane. Yield: $\mathrm{ArAsCl}_{2}: 5.2 \mathrm{~g}$ (34.8\%); $\mathrm{Ar}_{2} \mathrm{AsCl}: 4.8 \mathrm{~g}$ (20.4\%).

Elemental analysis for $\mathrm{C}_{18} \mathrm{~F}_{18} \mathrm{H}_{4} \mathrm{AsCl}$ (612.4), Calc C 32.14, H $0.60 \%$; Found C 32.19 , H $0.62 \%$.
${ }^{19} \mathrm{~F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \underline{\operatorname{ArAsCl}_{2}}: \delta-53.5\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-64.2\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm} ; \underline{\mathrm{Ar}} \underline{\underline{2}} \mathbf{\underline { A s C l }}:$ $\delta-54.6\left(\mathrm{~s}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.9\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.6.14 Synthesis of $\mathrm{ArAsH}_{2}$

$\mathrm{LiAlH}_{4}\left(1 \mathrm{M}\right.$ in $\left.\mathrm{Et}_{2} \mathrm{O}, 1.08 \mathrm{ml}, 1.08 \mathrm{mmol}\right)$ was added dropwise to a solution of $\mathrm{ArAsCl}_{2}$ $(0.93 \mathrm{~g}, 2.16 \mathrm{mmol})$ at room temperature. The solution was stirred for a few days. Solvents were removed under vacuum, giving a yellow oil.
${ }^{19}$ F NMR $\left(\mathrm{CDCl}_{3}\right): 8-61.4\left(\mathrm{t},{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{H}} 6.4 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-64.2\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.6.15 Synthesis of $\mathbf{A r A s B r}_{2} / \mathrm{Ar}_{2} \mathbf{A s B r}$

A diethyl ether solution of $\mathrm{ArLi}(10 \mathrm{mmol}, 50 \mathrm{ml})$ was added dropwise to an $\mathrm{AsBr}_{3}$ $(1.36 \mathrm{~g}, 5 \mathrm{mmol})$ solution in diethyl ether $(50 \mathrm{ml})$ at $-78^{\circ} \mathrm{C}$. The solution was left to warm to room temperature and stirred for four hours. A white precipitate of LiBr appeared. The solution was filtered and solvent and excess $\mathrm{AsBr}_{3}$ were removed under vacuum, leaving a brown solution. The solution was distilled under reduced pressure ( 0.02 Torr), giving a yellow oil. Fractions were collected at $120^{\circ} \mathrm{C}\left(\mathrm{ArAsBr}_{2}\right)$ and $150^{\circ} \mathrm{C}\left(\mathrm{Ar}_{2} \mathrm{AsBr}\right)$.
${ }^{19} \mathrm{~F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \underline{\operatorname{ArAsBr}_{2}}: \delta-53.2\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.8\left(\mathrm{~s}, 6 \mathrm{~F}, \mathrm{CF}_{3}\right) \mathrm{ppm} ; \underline{\mathrm{Ar}_{2}} \underline{\underline{A s B r}}$ : $\delta-54.4\left(\mathrm{~s}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.9\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.6.16 Synthesis of $\mathbf{A r}_{2} \mathbf{A s H}$

$\mathrm{LiAlH}_{4}$ ( 1 M in $\mathrm{Et}_{2} \mathrm{O}, 3.1 \mathrm{ml}, 3.13 \mathrm{mmol}$ ) was added dropwise to a solution of $\mathrm{Ar}_{2} \mathrm{AsCl}$ $(0.42 \mathrm{~g}, 0.27 \mathrm{mmol})$ at room temperature. The solution was refluxed for two days. Solvents were removed under vacuum, giving a colourless oil.
${ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-58.7\left(\mathrm{~d},{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{H}} 3.6 \mathrm{~Hz}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-64.2\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm} ;{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$ ): $\delta-6.4$ (broad singlet, As-H) ppm .

### 4.6.17 Synthesis of $\mathrm{Ar}^{\prime} \mathrm{AsCl}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}_{2} / \mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}$

A solution of $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}(100 \mathrm{ml}, 94 \mathrm{mmol})$ in diethyl ether was added dropwise to a solution of $\mathrm{AsCl}_{3}(13.5 \mathrm{ml}, 160 \mathrm{mmol})$ in hexanes $(100 \mathrm{ml})$ over a period of 20 minutes at $-78^{\circ} \mathrm{C}$. The mixture was allowed to warm to room temperature and stirred for four hours. A precipitate of LiCl formed. This was filtered off and the solvents and excess $\mathrm{AsCl}_{3}$ removed in vacuo, leaving a brown oil. . This oil was distilled under reduced pressure (0.01 Torr), and three different fractions were collected at $100^{\circ} \mathrm{C}\left(\mathrm{Ar}^{\prime} \mathrm{AsCl}_{2}\right), 115^{\circ} \mathrm{C}$ ( $\mathrm{Ar}^{\prime \prime} \mathrm{AsCl}_{2}$ ) and $145^{\circ} \mathrm{C}\left(\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}\right)$. $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}$ was purified by recrystallisation from hexanes. Yield (based on Ar'H): 4.5 g ( $9 \%$ )

Elemental analysis for $\mathrm{C}_{16} \mathrm{H}_{6} \mathrm{AsClF}_{12}$ (536.4), Calc C 35.79 , H $1.12 \%$; Found C 35.33 , H 1.10\%
${ }^{19}$ F NMR $\left(\mathrm{CDCl}_{3}\right): \mathrm{Ar}^{\prime} \mathrm{AsCl}_{2}: \delta-52.9\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right) \mathrm{ppm} ; \underline{\mathrm{Ar}^{\prime \prime} \mathrm{AsCl}_{2}} \mathbf{i} \delta-57.7(\mathrm{~s}, 3 \mathrm{~F}$, $o-\mathrm{CF}_{3}$ ), -63.7 ( $\mathrm{s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}$ ), $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}:-54.8$ (broad singlet, $6 \mathrm{~F}, o-\mathrm{CF}_{3}$ in $\mathrm{Ar}^{\prime}$ ), -58.8 (s, 3F, o-CF3 in Ar"), 63.5 (s, 3F, $p-\mathrm{CF}_{3}$ ) ppm; ${ }^{1} \mathbf{H}$ NMR $\left(\mathrm{CDCl}_{3}\right):$ Ar'Ar"AsCl: 8.1 (d, $\left.{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 8 \mathrm{~Hz}\right), 7.7(\mathrm{~s}), 7.28\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 8 \mathrm{~Hz}\right), 7.26\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 7.6 \mathrm{~Hz}\right), 6.6\left(\mathrm{t},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 7.6 \mathrm{~Hz}\right) \mathrm{ppm}$.

### 4.6.18 Synthesis of Ar'AsBr ${ }_{2} /$ Ar" $^{\prime} \mathbf{A s B r}_{2}$, $\mathbf{A r}_{2}{ }_{2} \mathrm{AsBr}$ and $\mathbf{A r}{ }^{\prime} \mathbf{A r " A s B r}$

A solution of $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}(50 \mathrm{ml}, 19 \mathrm{mmol})$ in diethyl ether was added dropwise to a solution of $\mathrm{AsBr}_{3}(3.2 \mathrm{~g}, 10 \mathrm{mmol})$ in hexanes $(25 \mathrm{ml})$ over a period of 20 minutes at room temperature. The mixture was allowed to warm to room temperature and stirred for four hours. Solvents and excess $\mathrm{AsBr}_{3}$ were removed in vacuo, leaving a brown oil Solvents were removed under vacuum, leaving a brown oil which was distilled under reduced pressure (0.01 Torr). Fractions were collected at $81^{\circ} \mathrm{C}\left(\mathrm{Ar}^{\prime} \mathrm{AsBr}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{AsBr}_{2}\right)$ and $110^{\circ} \mathrm{C}$ ( $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsBr} / \mathrm{Ar}{ }^{\prime \prime}{ }_{2} \mathrm{AsBr}$ ). Yield for $\mathrm{Ar}^{\prime} \mathrm{AsBr}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{AsBr}_{2} 3.8 \mathrm{~g}$ (42\%)
The Ar'Ar"AsBr/Ar" ${ }_{2} \mathrm{AsBr}$ mixture was dissolved in hexanes and left in the freezer. After one month colourless crystals of $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsBr}$ appeared. Yield for $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsBr}$ 0.98 g ( $31 \%$ ).

Elemental analysis for $\mathrm{C}_{16} \mathrm{H}_{6} \mathrm{AsBrF}_{12}$ (581.03), Calc C 33.08, H 1.04\%; Found C 33.46, H 1.04\% Yield 3.8 g (42\%)
 $-62.8\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$; $\underline{\mathrm{Ar}^{\prime} \mathrm{Ar} " \mathrm{AsBr}: ~} \delta-54.9$ (broad singlet, 6F, o-CF3 in Ar ), -58.8 ( s , $3 \mathrm{~F}, o-\mathrm{CF}_{3}$ in $\mathrm{Ar}{ }^{\prime}$ ), $\delta-63.5$ ( $\mathrm{s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}$ ) ppm ; $\underline{\mathrm{Ar} " 2}{ }_{2} \mathrm{AsBr}: \delta-58.4\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.6$ (s, $\left.6 \mathrm{~F}, \mathrm{p}-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.6.19 Synthesis of Ar'Ar"AsH

$\mathrm{LiAlH}_{4}(0.2 \mathrm{ml}, 1 \mathrm{M}$ in ether, 0.2 mmol$)$ was slowly added at $0^{\circ} \mathrm{C}$ to an $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}$ $(0.2 \mathrm{~g}, 0.4 \mathrm{mmol})$ solution in hexanes. The solution was left to warm to room temperature and stirred for four days. Solvents were removed in vacuo, and the resulting white solid washed three times with hexanes ( $3^{*} 2 \mathrm{~mL}$ ). Crystals were grown by sublimation under vacuum. Yield 0.15 g ( $71 \%$ ).
Elemental analysis for $\mathrm{C}_{16} \mathrm{H}_{7} \mathrm{AsF}_{12}$ (502.1), Calc C 38.27, H 1.41\%; Found C 37.98, H 2.03\%
${ }^{19} \mathrm{~F}$ NMR $\left(\mathrm{C}_{7} \mathrm{D}_{8}\right): \delta-58.2\left(\mathrm{~d}^{5}{ }^{5} \mathrm{~J}_{\mathrm{F}-\mathrm{H}} 7.1 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right.$ in $\left.\mathrm{Ar}^{\prime}\right),-61.2\left(\mathrm{~s}, 3 \mathrm{~F}, o-\mathrm{CF}_{3}\right.$ in $\left.\mathrm{Ar}{ }^{\prime}\right)$, $-63.8\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm} ;{ }^{1} \mathbf{H} \operatorname{NMR}\left(\mathrm{C}_{7} \mathrm{D}_{8}\right): \delta 8.06\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 8 \mathrm{~Hz}\right), 7.9(\mathrm{~s}), 7.7\left(\mathrm{t},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}}\right.$ $8 \mathrm{~Hz}), 7.4\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 8 \mathrm{~Hz}\right), 6.9\left(\mathrm{t},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}} 7.6 \mathrm{~Hz}\right), 5.99($ broad singlet, As-H) ppm.

### 4.6.20 Synthesis of $\mathbf{A r}^{\prime} \mathbf{S b C l}_{2} / \mathbf{A r}{ }^{\prime} \mathbf{S b C l}_{2} / \mathbf{A r}^{\prime}{ }_{2} \mathbf{S b C l} / \mathbf{A r}{ }_{2} \mathbf{S b C l} / \mathbf{A r}{ }^{\prime} \mathbf{A r}{ }_{2} \mathbf{S b}$

$2 \mathrm{Ar}^{\prime} \mathrm{Li}+2 \mathrm{Ar"Li} \xrightarrow[\text { hexane } \mathrm{Et} \mathrm{t}_{2} \mathrm{O}]{\mathrm{SbCl}_{3}} \mathrm{Ar}^{\prime} \mathrm{SbCl}_{2}+\mathrm{Ar}^{\prime \prime} \mathrm{SbCl}_{2}+\mathrm{Ar}_{2} \mathrm{SbCl}+\mathrm{Ar}_{2}{ }_{2} \mathrm{SbCl}+\mathrm{Ar}^{\prime} \mathrm{Ar}_{2}{ }_{2} \mathrm{Sb}$

A solution of $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}(100 \mathrm{ml}, 127 \mathrm{mmol})$ was added slowly to a $\mathrm{SbCl}_{3}$ solution in hexanes $/ \mathrm{Et}_{2} \mathrm{O}$ at room temperature. A precipitate of LiCl formed. The solution was stirred for 5 hours. The solution was filtered and the solvents and excess $\mathrm{SbCl}_{3}$ were removed under vacuum, leaving a brown oil, which was distilled under reduced pressure ( 0.02 Torr): fractions were collected at $95^{\circ} \mathrm{C}$ (orange oil, $\mathrm{Ar}^{\prime} \mathrm{SbCl}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{SbCl}_{2}$ ), and $120^{\circ} \mathrm{C}$ (yellow sticky oil). The latter yellow oil was dissolved in hexanes and left in the freezer
overnight. A white solid formed, which was filtered off and washed twice with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{SbCl} / \mathrm{Ar}{ }^{\prime}{ }_{2} \mathrm{SbCl}$ ). Solvents were removed from the filtered yellow solution leaving a sticky solid, which was recrystallised, from dichloromethane giving white crystals of Ar'Ar" ${ }_{2} \mathrm{Sb}$.

Elemental analysis for $\mathrm{C}_{24} \mathrm{H}_{9} \mathrm{~F}_{18} \mathrm{Sb}$ (761.06), Calc C 37.88, H 1.19\%; Found C 37.72, H 1.19\%.
${ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \underline{\mathrm{Ar}^{\prime} \mathrm{SbCl}_{2}}: \delta-53.2\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right) \mathrm{ppm} ; \underline{\mathrm{Ar}^{\prime} \mathrm{SbCl}_{2}}: \delta-54.9(\mathrm{~s}, 3 \mathrm{~F}$,
 $\delta-58.4\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.7\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm} ; \underline{\mathrm{Ar}^{\prime} \mathrm{Ar}{ }_{2} \underline{\mathrm{Sb}}: \delta-55.5\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3} \text { in } \mathrm{Ar} \text { '), }\right.}$ $-58.4\left(\mathrm{~s}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right.$ in $\left.\mathrm{Ar}{ }^{\prime}\right),-63.6\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 4.6.26 Attempted reaction between $\mathbf{A r}{ }^{\prime} \mathrm{Li} / \mathbf{A r} " \mathrm{Li}$ and $\mathrm{BiCl}_{3}$

A solution of $\mathrm{Ar}{ }^{\prime} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}(50 \mathrm{ml}, 30 \mathrm{mmol})$ was added slowly to a $\mathrm{BiCl}_{3}(4.922 \mathrm{~g}, 15.6$ mmol) solution in $\mathrm{Et}_{2} \mathrm{O}$ at room temperature. A precipitate of LiCl formed. The solution was stirred for overnight. The solution was filtered and the solvents and excess $\mathrm{SbCl}_{3}$ were removed under vacuum, leaving a beige solid. Attempt was made to dissolve this solid in CDCl 3 but the material was only partially soluble, and no peaks could be assigned in the 19F NMR spectrum. The mixture was not further investigated.

Chapter 5
${ }^{19} \mathrm{~F}$ Variable
Temperature NMR Studies

### 5.1 Introduction

Rotations of chemical bonds may involve some barrier to rotation. NMR is the most common method to determine energetic barriers to dynamic processes in molecules.
As described in the previous chapter, the ${ }^{19} \mathrm{~F}$ NMR spectra of $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime}$ 'EX ( $\mathrm{E}=\mathrm{P}$ or As; $\mathrm{X}=\mathrm{Cl}, \mathrm{Br}, \mathrm{H})$ at room temperature exhibit a broad singlet of double intensity corresponding to the two $\mathrm{CF}_{3}$ groups of the Ar ' moiety in the ortho position.

Figure 5.1: Room Temperature ${ }^{19} \mathrm{~F}$ NMR spectrum of $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsCl}$

This broad signal shows the inequivalence of the two $\mathrm{CF}_{3}$ groups, due to hindered rotation of the aryl ring around the central atom ( P or As). This signal was resolved using variable temperature NMR studies over the range -80 to $100^{\circ} \mathrm{C}$. The rate at which the aromatic ring rotates is governed principally by the dynamics of neighbouring groups, which must move aside to allow the ring to flip. If the rate is comparable to the frequency difference between the lines (as for Ar'Ar"EX at room temperature), a broad signal is
shown. If the rate is very slow (low temperature), separate signals appear, and if the rate is very high (high temperature) a sharp single line is observed.

- Rate measurements

The temperature range over which measurements are made can be increased by using a combination of techniques. In the slow exchange regime, the exchange rate can be determined by selective inversion-recovery. When the rate is of the same order as the frequency difference between the lines in question, their appearance becomes strongly dependent on the exchange rate.

Some lineshape NMR experiments over a wide range of temperature have permitted determination of these rates in the slow, intermediate and fast exchange regimes. The temperature range has been extended to a point, where the free energy $\Delta \mathrm{G}^{\ddagger}$ can be separated into two contributions: the enthalpy $\left(\Delta H^{\ddagger}\right)$ and entropy ( $\Delta \mathrm{S}^{\ddagger}$ ) of activation.

When exchanges are comparable to chemical shift differences, characteristic line broadening and coalescence occur in the spectrum. This can be simulated using classic ${ }^{1,2}$ or newer approaches, ${ }^{3}$ in order to estimate the exchange rate.

Quoting the Gibbs free energy of activation, $\Delta \mathrm{G}^{\ddagger}$, is equivalent to quoting the rate, since transition state theory says that the rate is given by the following equation;

$$
\begin{aligned}
\text { rate constant } & =\frac{k T}{h} e^{-\Delta G^{*} / R T} \\
& =\frac{k T}{h} e^{-\Delta H^{*} / R T} e^{-\Delta S^{*} / R}
\end{aligned}
$$

Where $k$ is Boltzmann's constant, $h$ is Planck's constant and the transmission coefficient is assumed to be unity.
In order to separate the enthalpy and the entropy of activation, the rate constant is measured as a function of temperature, T , and an Eyring plot of $\ln ($ rate constant $/ \mathrm{T}$ ) vs $(1 / \mathrm{T})$ is constructed. This plot $(\mathrm{y}=a \mathrm{x}+b)$ yields a slope $a$ and intercept $b$. From this, the enthalpy and entropy can be easily determined:

$$
\begin{gathered}
\Delta \mathrm{G}^{\ddagger}=\Delta \mathrm{H}^{\ddagger}-\mathrm{T} \Delta \mathrm{~S}^{\ddagger} \\
\Delta \mathrm{H}^{\ddagger}=-a \mathrm{R} \\
\Delta \mathrm{~S}^{\ddagger}=\mathrm{R}(b-23.76)
\end{gathered}
$$

To obtain reliable thermodynamic data, it is important to measure the rate over as wide a range of temperatures as possible.

### 5.2 Phosphorus compounds

### 5.2.1 Ar'Ar" PCl

- Variable temperature ${ }^{19}$ F NMR measurements

At ambient temperature, a doublet at $-59.3 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\text {P-F }} 59.1 \mathrm{~Hz}\right.$ ) and two singlets (a broad double intensity line at -55.4 and a sharp peak at- 64.1 ppm ) were observed.
Spectra were recorded for a toluene solution, every $10^{\circ} \mathrm{C}$ from $-80^{\circ} \mathrm{C}$ to $+100^{\circ} \mathrm{C}$. (Figure 5.2).

Figure 5.2: Variable temperature ${ }^{19} \mathrm{~F}$ NMR Spectra for $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{PCl}$

Figure 5.3: Inequivalent $\mathrm{CF}_{3}$ groups in the ${ }^{19} F N M R$ at low temperature

As the temperature is decreased, the peak broadens, then decoalesces near $10^{\circ} \mathrm{C}$. The $\mathbf{A}$ and $\mathbf{B}$ signals then begin to resharpen.

At low temperature, two doublets and two singlets are observed. Signals assigned to the Ar" group are detected at similar positions to those at room temperature ( $\delta-58.8, \mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}$ 59.1 Hz and $\delta-62.8 \mathrm{ppm}$ ), suggesting either that rotation about the $\mathrm{P}-\mathrm{Ar}$ " bond is rapid on the NMR timescale even at low temperature, or that there is a single fixed conformation about the $\mathrm{P}-\mathrm{C}$ bond. The Ar ' moiety shows a doublet at $-53.4 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}\right.$ 76.7 Hz )at $-83^{\circ} \mathrm{C}$ and a singlet at -55.8 ppm .

Figure 5.4: ${ }^{19} \mathrm{~F}$ NMR spectrum at $-90^{\circ} \mathrm{C}$

As the temperature is raised, the broad peak sharpens and the broad signal is resolved into a doublet ( $\delta-54.9,{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 36.5 \mathrm{~Hz}$ ) at $70^{\circ} \mathrm{C}$. At $100^{\circ} \mathrm{C}$, a sharp doublet is also observed at $-54.9 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 41.7 \mathrm{~Hz}\right)$. This shows that the rotation about the P-C bond is fast enough on the NMR timescale for the two $\mathrm{CF}_{3}$ groups to become equivalent.

Figure 5.5: Equivalent $C F_{3}$ groups in the ${ }^{19} F$ NMR at high temperature

Table 5.1: Comparison of fluorine chemical shift data at different temperatures

[^5]The values of ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}$ in this kind of system involving Ar'P or Ar"P bonds may contain a strong contribution from through space effects. Therefore, this implies that not only the two $\mathrm{CF}_{3}$ groups in Ar ' are not equivalent but also that one of them may be further away from the phosphorus atom. This was confirmed by the crystal structure, where intramolecular P---F interactions are observed (see chapter 4).

- Rotational barrier calculations

The Ar' group rotation was investigated in detail by bandshape fitting for temperatures between $-80^{\circ} \mathrm{C}$ and $+100^{\circ} \mathrm{C}$. Lineshapes were simulated by P. Hazendonk using MATLAB (section 5.5.3) and compared visually with the experimental spectra (Figure 5.6).

Figure 5.6: Simulated (red line) and experimental (blue line) ${ }^{19} \mathrm{~F}$ NMR spectrum at $-20^{\circ} \mathrm{C}$.

The exchange rates are summarized in Table 5.2 and the Eyring Plot is shown in Figure 5.7.

Table 5.2: Rates Determined by Lineshape Analysis.

## Figure 5.7: Eyring Plot for Ar ' $\mathrm{Ar}{ }^{\prime \prime} \mathrm{PCl}$

The Eyring Plot enables the enthalpy and entropy of the rotation to be determined. The ring flip process has a barrier of $\Delta H^{\ddagger}=51.0 \mathrm{~kJ} . \mathrm{mol}^{-1}$. The entropy $\Delta \mathrm{S}^{\ddagger}$ is $-7.6 \mathrm{~J} . \mathrm{mol}^{-1} . \mathrm{K}^{-1}$.

### 5.2.2 Ar'Ar"PH

- NMR

As in $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime} \mathrm{PCl}$, at room temperature, the same kind of spectrum is observed, with a broad singlet at -57.6 ppm corresponding to the two $\mathrm{CF}_{3}$ groups of the Ar' moiety. As the temperature decreases, the broad signal decoalesces near $-20^{\circ} \mathrm{C}$. The components then begin to resharpen. At $-90^{\circ} \mathrm{C}$, a doublet at $-56.0 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 57.8 \mathrm{~Hz}\right)$ and a singlet at -58.6 ppm are observed. At high temperature $\left(90^{\circ} \mathrm{C}\right)$, the singlet sharpens as the two ortho trifluoromethyl groups of the Ar' ring become equivalent. A doublet is shown at -57.6 $\mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 29.3 \mathrm{~Hz}\right)$ (Figure 5.8).

Figure 5.8: Section of the $V T^{19} F$ NMR spectra of Ar'Ar"PH

- Rotational barrier calculations

The Eyring plot of the rate derived from lineshape analysis gave the enthalpy and entropy: $\Delta H^{\ddagger}=42.4 \mathrm{~kJ} . \mathrm{mol}^{-1}$ and $\Delta \mathrm{S}^{\ddagger}-14.9 \mathrm{~J} . \mathrm{mol}^{-1} \cdot \mathrm{~K}^{-1}$. Due to a smaller steric demand of the hydrogen atom in comparison with the chlorine atom, the energy required for the ring to rotate is larger in $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{PCl}$.

Figure 5.9: Eyring plot for $A r^{\prime} A r r^{\prime \prime} P H$

### 5.2.3 ArAr"PCL/ArAr'PCl

- NMR measurements

As explained in chapter 4, the products ArAr' PCl and ArAr" PCl could not be separated. The ${ }^{19} \mathrm{~F}$ NMR spectrum at room temperature for ArAr' PCl shows two very close doublets at $-54.1\left({ }^{4} \mathrm{~J}_{\text {P-F }} 42.1 \mathrm{~Hz}\right)$ and $-54.2 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\text {P-F }} 42.1 \mathrm{~Hz}\right)$, corresponding to the $\mathrm{CF}_{3}$ groups in ortho positions for the Ar and Ar' moieties.

Figure 5.10: ${ }^{19} \mathrm{~F}$ NMR spectrum of the ortho-CF ${ }_{3}$ groups of ArAr ' PCl at room temperature

In ArAr" ${ }^{\prime} \mathrm{PCl}$, at ambient temperature, a broad singlet at -55.5 ppm is observed for the two $o-\mathrm{CF}_{3}$ groups of the Ar moiety and, a doublet at $-58.6\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 58.3 \mathrm{~Hz}\right)$ for the $o-\mathrm{CF}_{3}$ groups in the Ar" moiety.

The broad singlet decoalesced near $0^{\circ} \mathrm{C}$, and was resolved at $-50^{\circ} \mathrm{C}$ into a doublet at -53.9 ppm ( ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 80.9 \mathrm{~Hz}$ ) and a singlet at -56.4 ppm (Table 5.4 ). At a lower temperature, the doublet overlapped the signals from the ortho- $\mathrm{CF}_{3}$ of $\mathrm{ArAr}{ }^{\prime} \mathrm{PCl}$ (Figure 5.11).

Figure 5.11: Low temperature ${ }^{19} \mathrm{~F}$ NMR spectra of $\mathrm{ArAr}{ }^{\prime \prime} \mathrm{PCl} / \mathrm{ArAr}$ 'PCl (the weaker peaks are those from $\mathrm{ArAr}{ }^{\prime P} \mathrm{PCl}$ )

At high temperature, the broad singlet is resolved into a doublet at -55.7 ppm as the $\mathrm{CF}_{3}$ groups of Ar become equivalent.

Fast fluorine exchange is also observed for ArAr'PCl. The two doublets at -54.1 and -54.3 ppm become a single doublet at $-20^{\circ} \mathrm{C}$ and a broad singlet at $-90^{\circ} \mathrm{C}$. Unfortunately, due to solvent restrictions, it has not been possible to extend the series to lower temperature. At $60^{\circ} \mathrm{C}$, the doublet becomes an apparent triplet due to overlapping of the two doublets (Figure 5.12). This overlapping is due to accidental degeneracy (the chemical shifts move with the temperature change). At low temperature the exchange occur.

Figure 5.12: Section of the ${ }^{19} \mathrm{~F}$ NMR spectra of ArAr ' PCl

| Assignment | $\delta_{\mathrm{a}}(\mathrm{ppm})$ <br> Ar | $\delta_{\mathrm{b}}(\mathrm{ppm})$ <br> Ar | $\delta_{\mathrm{c}}(\mathrm{ppm})$ <br> $\mathrm{Ar} \mathrm{\prime}$ | $\delta_{\mathrm{d}}(\mathrm{ppm})$ <br> $\mathrm{Ar}^{\prime \prime}($ para $)$ |

Table 5.4: Comparison of fluorine chemical shift data at different temperatures

[^6]- Rotational barrier calculations

Simulations have only been done for $\mathrm{ArAr}^{\prime \prime} \mathrm{PCl}$. Calculations for $\mathrm{ArAr}^{\prime} \mathrm{PCl}$ would require variable temperature NMR spectra at a lower temperature than $-90^{\circ} \mathrm{C}$.

The Eyring plot of ArAr'PCl is shown in Figure 5.13.

Figure 5.13: Eyring Plot of $\mathrm{ArAr}{ }^{\prime \prime} \mathrm{PCl}$

The enthalpy and entropy determined from the Eyring plot are: $\Delta \mathrm{H}^{\ddagger}=51.9 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ and $\Delta \mathrm{S}^{\ddagger}=-8.6 \mathrm{~J} . \mathrm{mol}^{-1} \cdot \mathrm{~K}^{-1}$. The enthalpy is similar to the one found in $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PCl}$. This is due to the fact that the two molecules only differ by the presence of one more para-CF ${ }_{3}$ group from the Ar moiety. Para- $\mathrm{CF}_{3}$ groups are not expected to have any influence on the rotational energy barrier. The ${ }^{4} \mathrm{~J}_{\text {P.F }}$ coupling constants determined at different temperature also reflect the rotation of the molecule (Table 5.5). The molecule is in a different conformation and the ortho- $\mathrm{CF}_{3}$ groups are closer or further away from the phosphorus atom. The presence of through space interactions (found in the crystal structure) contributes to the change in the coupling constants. As the molecule rotates, the $\mathrm{CF}_{3}$ groups are closer or further away from the phosphorus atom.

| ${ }^{4} \mathrm{~J}_{\mathrm{P} \text { - }}(\mathrm{Hz})$ |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Ar'(or Ar) |  |  |  |  |  |
|  | High Temp. | Room Temp. | Low Temp. | High Temp. | Room Temp. | Low Temp. |
| Ar'Ar"PCl | 41.7 |  | 76.7 | 56.8 | 58.3 | 59.5 |
| Ar'Ar''PH | 29.1 |  | 57.5 | 45.1 | 43.7 | 40.0 |
| ArAr"PCl |  | 77 | 80.9 | 59.7 | 58.3 | 59.7 |

Table 5.5: ${ }^{4} J_{P-F}$ coupling constants at different temperatures

At high temperature, the two $\mathrm{CF}_{3}$ groups of the Ar' groups are equivalent; they are equidistant from the central atom. When the temperature decreases, they become inequivalent and one $\mathrm{CF}_{3}$ is further away from the phosphorus atom. Only one P-F coupling is seen in the NMR spectrum, which shows a doublet and a singlet.

### 5.3 Arsenic compounds

### 5.3.1 Ar'Ar"AsCl

- NMR measurements

The room temperature ${ }^{19} \mathrm{~F}$ NMR spectrum of $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{AsCl}$ is shown in Figure 5.1. As for the phosphorus derivatives, the spectrum exhibits a broad singlet corresponding to the two $o-\mathrm{CF}_{3}$ groups of the Ar' moiety. Variable temperature spectra were recorded in $\mathrm{d}_{8}-$ toluene over the range $-80^{\circ} \mathrm{C}$ to $60^{\circ} \mathrm{C}$ (Figure 5.14).

At the temperature is lowered, the signal broadens, then decoalesces near $-5^{\circ} \mathrm{C}$, and resharpens to give two distinct singlets from $-60^{\circ} \mathrm{C}$. As the temperature rises, the signal sharpens and a singlet is observed at $60^{\circ} \mathrm{C}$. Table 5.6 summarises the fluorine chemical shifts at different temperatures.

At $-80^{\circ} \mathrm{C}$, the width of the two singlets differs. This can be explained by through-space interaction with some fluorines from one of the $o-\mathrm{CF}_{3}$ groups and the arsenic atom (chapter 4).

Table 5.6: Comparison of fluorine chemical shifts at different temperatures for $\mathrm{Ar}^{\prime} \mathrm{Ar}$ " AsCl

- Rotational barrier calculations

Rate constants were calculated by lineshape analysis and the Eyring plot was constructed (Figure 5.15). The Eyring plot gave $\Delta \mathrm{H}^{\ddagger}=48.7 \mathrm{kJ}. \mathrm{~mol}^{-1}$ and $\Delta \mathrm{S}^{\ddagger}=0.4 \mathrm{~J} . \mathrm{mol}^{-1} . \mathrm{K}^{-1}$.

Figure 5.15: Eyring Plot for $A r$ ' $A r$ " $A s C l$

The enthalpy is slightly lower than for the analogous phosphorus compound, $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime} \mathrm{PCl}$.

### 5.3.2 Ar'Ar"AsBr

- NMR measurements

Variable temperature ${ }^{19} \mathrm{~F}$ NMR spectra showed the same behaviour as those for Ar'Ar"AsCl. The broad signal at room temperature broadens as the temperature decreases, and decoalesces at about $0^{\circ} \mathrm{C}$ to give two sharp singlets at $-50^{\circ} \mathrm{C}$ (Figure 5.16). The $o-\mathrm{CF}_{3}$ groups are then inequivalent.

Figure 5.16: ${ }^{19} \mathrm{~F}$ NMR spectrum of $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsBr}$ at $-50^{\circ} \mathrm{C}$

When the temperature is increased, the broad singlet sharpens and a sharp singlet appears at $100^{\circ} \mathrm{C}$, indicating the equivalence of the $\mathrm{CF}_{3}$ groups in the ortho position.

Figure 5.17: ${ }^{19} \mathrm{~F}$ NMR spectrum of $\mathrm{Ar}{ }^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{AsBr}$ at $100^{\circ} \mathrm{C}$

Over the whole range of temperature, the signals from the $\mathrm{CF}_{3}$ groups of the Ar " aryl ring are found at almost the same chemical shifts (Table 5.7).

|  | $\delta_{\mathrm{a}}(\mathrm{ppm})$ |  | $\delta_{\mathrm{b}}(\mathrm{ppm})$ | $\delta_{\mathrm{c}}(\mathrm{ppm})$ |
| :---: | :---: | :---: | :---: | :---: |

- Rotational barrier calculations

The Eyring plot shown in Figure 5.18 , gave $\Delta \mathrm{H}^{\ddagger}=49.0 \mathrm{~kJ}$. mol ${ }^{-1}$ and $\Delta \mathrm{S}^{\ddagger}=-3.0 \mathrm{~J} . \mathrm{mol}^{-1}$. $\mathrm{K}^{-1}$ 。

Figure 5.18: Eyring plot for $\mathrm{Ar}{ }^{\prime} A r^{\prime \prime} A s B r$

### 5.3.3 Ar'Ar"AsH

Spectra were recorded from $-80^{\circ} \mathrm{C}$ to $+100^{\circ} \mathrm{C}$. The room temperature spectrum did not show a broad singlet but a sharp one for the $o-\mathrm{CF}_{3}$ groups. This started to broaden at $10^{\circ} \mathrm{C}$ and decoalesced near $-50^{\circ} \mathrm{C}$. The spectrum at $-80^{\circ} \mathrm{C}$ showed two singlets at -56.3 and -58.1 ppm (Figure 5.19). These two signals were still broad signals, and while studies at a lower temperature are expected to sharpen them, low temperature experiments were limited by the solvent, which freezes at $-90^{\circ} \mathrm{C}$. Spectra at high temperature showed a sharp singlet.

Table 5.9: Thermodynamic parameters for $\mathrm{Ar} r^{\prime} A r$ " $E X$ and $A r A r " P C l(E=P$ or $A s ; X=$

$$
\mathrm{H}, \mathrm{Cl} \text { or } \mathrm{Br})
$$

The enthalpy of activation of arsenic derivatives increases from Ar'Ar"AsH to Ar'Ar"AsBr: $\Delta H^{\ddagger}{ }_{\text {AsH }}<\Delta H^{\ddagger}{ }_{\text {AsCl }}<\Delta H^{\ddagger}{ }_{\text {AsBr }}$. This is also observed in phosphorus compounds. $\Delta \mathrm{H}^{\ddagger}{ }_{\mathrm{PH}}<\Delta \mathrm{H}^{\ddagger}{ }_{\mathrm{PCL}}$. This reflects the steric demand of the bromine atom in comparison with the hydrogen atom. The bigger the atom X is, the more energy the molecule will need to rotate.

In analogous compounds, the enthalpy of activation is larger for phosphorus than for arsenic ( $\left.\Delta \mathrm{H}^{\ddagger}{ }_{\mathrm{AsCl}}<\Delta \mathrm{H}^{\ddagger}{ }_{\mathrm{PCl}}\right)$ reflecting a greater space around the larger atom. This is confirmed in the crystallographic data (Table 5.10 and 5.11). Due to less steric demand of the hydrogen, bond distances and angles are shorter in Ar'Ar"EH derivatives. The longer the E-C' distance is, the less energy is required for the rotation. The same applies to the bond angles. They are much smaller in Ar'Ar"AsH than in all other compounds containing halogens. The $\mathrm{C}^{\prime}$ - E-C" angle does not seem to play an important role in the rotational energy. In fact, angle $\mathrm{C}^{\prime}-\mathrm{As}-\mathrm{C}$ " is smaller than $\mathrm{C}^{\prime}-\mathrm{P}-\mathrm{C}$ " in the chlorine
derivatives and the enthalpies of activation are very close to each other $\left(\Delta \mathrm{H}^{\ddagger}{ }_{\mathrm{AsCl}}=48.7\right.$ $\mathrm{kJ} . \mathrm{mol}^{-1}$ and $\left.\Delta \mathrm{H}^{\ddagger}{ }_{\mathrm{PCl}}=51.0 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right)$.

| Bond distances $(\AA)$ | Ar'Ar"AsH $^{\prime}$ | Ar'Ar"AsCl $^{\prime}$ | Ar'Ar"AsBr $^{\prime}$ | Ar'Ar"PCl |
| :---: | :---: | :---: | :---: | :---: |
| E-X | 0.98 | 2.20 | 2.35 | 2.06 |

| Angles ( ${ }^{\circ}$ ) | Ar'Ar"AsH $^{\prime}$ | $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsCl}$ | $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime \prime} \mathrm{AsBr}$ | $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{PCl}$ |
| :---: | :---: | :---: | :---: | :---: |
| X-E-C' | 79.20 | 98.00 | 98.91 | 100.23 |
| X-E-C" | 83.50 | 100.08 | 101.43 | 102.10 |
| C'-E-C" | 98.09 | 102.98 | 103.15 | 109.23 |

Table 5.11: Bond Angles ( ${ }^{\circ}$ ) in Ar'Ar'EX compounds

Except for Ar'Ar"AsCl, all the entropy values are negative. This indicates that the transition state is more ordered than the optimum geometry, and that there is a preferred orientation of the ring. This orientation is due to the intramolecular interactions found in all the compounds structurally characterised, where four short E---F contacts are observed in each case (chapter 4). Two of those contacts come from the same $\mathrm{CF}_{3}$ group in the Ar' moiety.

In Ar'Ar'AsCl, the entropy change is negligible and the rotational energy is just governed by the enthalpy factor. Entropy values are larger in the arsenic compounds than
in phosphorus derivatives. This can be explained by less steric constraint, due to a larger size of the As central atom.

### 5.5 Experimental

### 5.5.1 Syntheses

All the compounds have been prepared in the laboratory, and syntheses are described in Chapter 4.

### 5.5.2 NMR spectroscopy

NMR measurements were performed on a Varian VXR 400 ( $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime} \mathrm{PCl}$ ) or a Varian Inova 500 spectrometer at 376.34 MHz and 470.26 MHz respectively. For low temperature, the probe was cooled using liquid $\mathrm{N}_{2}$ and allowed to equilibrate for a few minutes at each temperature before each acquisition. All NMR spectra were recorded in $\mathrm{d}_{8}$-toluene. Temperature calibration was done by chemical-shift difference between the OH resonances and $\mathrm{CH}_{\mathrm{n}}$ resonances in either methanol (for low temperature) or ethylene glycol (for high temperature).

### 5.5.3 Lineshape analysis

The simulation program was written using MATLAB, assuming that the $\mathrm{CF}_{3}$ groups were rotationally averaged to be equivalent. The phosphorous-containing compounds were simulated as an AX system exchanging with an MX, where the nuclei $A$ and $M$ are observed, representing the $\mathrm{CF}_{3}$ groups. The chemical shift of A and M as well as the couplings $\mathrm{J}_{\mathrm{AX}}$ and $\mathrm{J}_{\mathrm{MX}}$ were used as free parameters, along with their spin lattice relaxation times, $\mathrm{T}_{2 \mathrm{~A}}$ and $\mathrm{T}_{2 \mathrm{~B}}$.

Simulations were performed by varying the rate of exchange, and comparing the results with the experimental spectrum. The chi-squares $\left(\chi^{2}\right)$ were computed between the simulated and measured data points. The rate with the lowest chi-squares $\left(\chi^{2}\right)$ was taken as the measured rate.

# Chapter 6 <br> Synthesis of Platinum Complexes 

### 6.1 Introduction

The chemistry of platinum has been widely developed over the last 50 years due to its nobility and catalytic properties. Its properties depend on the large number of valence $d$ electrons, which provide a series of orbitals of a range of energies and symmetries capable of bonding with a large range of compounds.

### 6.2 Platinum complexes

Platinum exists in different oxidation states, on which depends the geometry of the complexes (Table 6.1).

| Oxidation states | Coordination <br> number | Stereochemistry | Examples |
| :--- | :--- | :--- | :--- |
|  | 3 |  |  |
| $0\left(\mathrm{~d}^{10}\right)$ | 4 | planar | $\left[\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{3}\right]$ |
|  | tetrahedral | $\left[\mathrm{Pt}^{8}\left(\mathrm{PF}_{3}\right)_{4}\right]$ |  |
|  | 4 | square planar | $\left[\mathrm{PtCl}_{4}\right]^{2-}$ |
| $3\left(\mathrm{~d}^{7}\right)$ | 5 | trigonal bipyramidal | $\left[\mathrm{Pt}(\mathrm{qas}) \mathrm{I}^{+\mathrm{a}}\right.$ |
| $4\left(\mathrm{~d}^{6}\right)$ | 4 | square planar | $\left[{\left.\mathrm{Pt}\left(\mathrm{C}_{6} \mathrm{Cl}_{5}\right)_{4}\right]}\right.$ |
|  | 6 | octahedral | $\left[\mathrm{PtCl}_{6}\right]^{2-}$ |
| $5\left(\mathrm{~d}^{5}\right)$ | 8 | "piano-stool" | ${\left.\mathrm{Pt}\left(\eta^{5}-\mathrm{C}_{5} \mathrm{H}_{5}\right) \mathrm{Me}_{3}\right]}^{6\left(\mathrm{~d}^{4}\right)}$ |

## Table 6.1: Different oxidation states of platinum

- Oxidation State $4\left(\mathrm{~d}^{6}\right)$

All complexes in this oxidation state which have been characterised, are octahedral and diamagnetic, with a low spin $\mathrm{t}_{2 \mathrm{~g}}{ }^{6}$ configuration.
There are several Pt(IV) complexes. These compounds are thermodynamically stable and kinetically inert. Those with halides, pseudo-halides and N -donors are especially

[^7]numerous: $\left[\mathrm{PtX}_{6}\right]^{2-},\left[\mathrm{PtX}_{4} \mathrm{~L}_{2}\right]$, $\left[\mathrm{PtL}_{6}\right]$ have been characterised. O-donor ligands such as OH - also coordinate to $\mathrm{Pt}(\mathrm{IV})$, but S -, Se - , P - and As-donor ligands tend to reduce it to $\mathrm{Pt}(\mathrm{II})$.

- Oxidation state $3\left(\mathrm{~d}^{7}\right)$

This oxidation state is much less encountered. However, the most abundant examples of $\mathrm{Pt}(\mathrm{III})$ are dinuclear compounds of the type $\left[\mathrm{Pt}_{2}(\mathrm{~L}-\mathrm{L})_{4} \mathrm{~L}_{2}\right]^{\mathrm{n}-1}$ with single $\mathrm{Pt}-\mathrm{Pt}$ bonds and a tetrabridged structure.

- Oxidation state $2\left(\mathrm{~d}^{8}\right)$

This is the most abundant oxidation state.
The complexes of $\mathrm{Pt}(\mathrm{II})$ are diamagnetic and square planar. The diagram below shows the change in energy of the d-orbitals on the metal as the axial ligands are removed from an octahedral complex. Any orbital containing " z " character ( $\mathrm{d}_{\mathrm{z}}{ }^{2}, \mathrm{~d}_{\mathrm{xz}}, \mathrm{d}_{\mathrm{yz}}$ ) lowers in energy, and the other orbitals rise in energy accordingly. These effects cause the crystal field splitting pattern of the $d$ orbitals to change dramatically, thus causing the pairing of the eight electrons.

Figure 6.1: Electron pairing in a square planar complex

Not many complexes are formed with O -donor ligands, although complexes $\left[\mathrm{PtX}_{4}\right]^{2-}(\mathrm{X}=$ $\mathrm{Cl}, \mathrm{Br}, \mathrm{I}, \mathrm{SCN}, \mathrm{CN}$ ) can easily be obtained. Complexes with ammonia and amines of the types $\left[\mathrm{PtLL}_{4}\right]^{2+}$ or $\mathrm{PtL}_{2} \mathrm{X}_{2}$ are also numerous.

- Oxidation state $0\left(\mathrm{~d}^{10}\right)$

Complexes in oxidation state 0 are compounds of the type $\left[\mathrm{Pt}\left(\mathrm{PR}_{3}\right)_{4}\right]$. They are air stable with a tetrahedral geometry. Their most important property is their readiness to dissociate in solution to form three-coordinate planar $\left[\mathrm{Pt}\left(\mathrm{PR}_{3}\right)_{3}\right]$.

### 6.2.1 Platinum complexes as chemotherapeutic agents

The discovery of the cytotoxic properties of cis-dichlorodiammineplatinum(II) [ $\left.\mathrm{PtCl}_{2}\left(\mathrm{NH}_{3}\right)_{2}\right]$, now known as anticancer cisplatin, was made by the physicist Rosenberg and coworkers in 1965. ${ }^{2}$ They also noticed that the active complexes $\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Cl}_{2}$ and $\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Cl}_{4}$ were only active in their cis-configuration. ${ }^{3}$ Since then, the search for antitumour active platinum complexes has been intense and extensive, with a multiplicity of ligand combinations being studied. However, some attempts to replace nitrogen donors with phosphorus have not generally been successful. This has been attributed to a strong trans effect exerted in dichlorophosphane-Pt(II) compounds. Fluorophosphanes are believed to overcome this effect due to their strong $\sigma$-donor and $\pi$-acceptor properties. 4,5 The complex cis-[Pt( $\left.\mathrm{ArP}=\mathrm{PAr})\left(\mathrm{PEt}_{3}\right) \mathrm{Cl}_{2}\right]$, containing a low-coordinate phosphorus ligand, has shown anti-tumour properties, however, against a range of cancers. ${ }^{6}$

### 6.2.2 NMR spectroscopy

When considering characterisation of compounds using NMR, bonding any phosphorus species directly to platinum has one advantage. Both $\operatorname{Pt}(0)$ and $\operatorname{Pt}(\mathrm{II})$ are diamagnetic and do not broaden the signal due to unpaired electrons.
In square planar platinum(II) complexes containing phosphane ligands $\left(\mathrm{PR}_{3}\right)$, the ${ }^{31} \mathrm{P}$ NMR spectrum of the complex provides valuable information about the cis or trans arrangement of the ligands. The isotope ${ }^{195} \mathrm{Pt}, \mathrm{I}=1 / 2$, constitutes $33.8 \%$ of naturally
occurring platinum; in a ${ }^{31} \mathrm{P}$ NMR spectrum of a complex such as $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$, there is spin-spin coupling between the ${ }^{31} \mathrm{P}$ and the ${ }^{195} \mathrm{Pt}$ nuclei which gives rise to satellite peaks. If the $\mathrm{PR}_{3}$ group are mutually trans, the value of $\mathrm{J}_{\mathrm{P}-\mathrm{Pt}} \approx 2000-3000 \mathrm{~Hz}$ but if the ligands are cis, the coupling constant is much larger, $\approx 3000-3500 \mathrm{~Hz} .{ }^{7}$ While the values vary somewhat, comparison of the ${ }^{31} \mathrm{P}$ NMR spectra of cis and trans isomers of a given complex enables the configuration to be assigned.
When two different phosphorus donors are present, as in the present work where $\mathrm{PEt}_{3}$ is usually ligated to platinum because of the starting material used (section 6.2), the ${ }^{2} \mathrm{~J}$ coupling between the phosphorus atom of the new phosphane ligand and the phosphorus from $\mathrm{PEt}_{3}\left({ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}\right)$ shows a great difference: for the trans isomer ${ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}$ varies between 400 and 800 Hz , whereas it is very small in the cis isomer (about 15 Hz ). The coupling constant between the phosphorus and the platinum ( ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}$ ) is revealed to be greater in the cis isomer ( ${ }^{1} \mathrm{~J}_{\mathrm{Pt} t \mathrm{P}}$ from 3000 to 6000 Hz ) than in the trans isomer ( ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}}$ from 2000 to 3000 Hz ). Goodwin ${ }^{8}$ and Roden ${ }^{9}$ demonstrated that the value of the coupling constant also depends on the groups attached to phosphorus. They showed that the largest coupling constants were formed in the compounds where there were the greatest electron withdrawal, for example ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}}$ for $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ is bigger that that for $\mathrm{Ar}^{\prime} \mathrm{PH}_{2}$.

### 6.3 The "platinum dimer"

The platinum(II) dimer has been used initially in previous work on fluoromes and fluoroxyl systems because the diphosphene $\mathrm{ArP}=\mathrm{PAr}$ did not react with similar $\mathrm{Pt}(\mathrm{II})$ compounds $\left(\mathrm{PtCl}_{2}, \mathrm{PtCl}_{2}(\mathrm{PhCN})_{2}\right)$. This dimer is prepared in three steps according to the reaction shown in Equation 6.1.10

Equation 6.1: Synthesis of Pt Dimer

### 6.3.1 Reactions with low coordinate phosphorus species

The synthesis of this kind of complex involved the addition of one equivalent of Pt dimer to two equivalents of phosphorus compound in dichloromethane, at room temperature.

- with phosphanes

The platinum dimer can form complexes with phosphanes containing bulky electronwithdrawing substituents such as $\mathrm{ArPCl}_{2}, \mathrm{ArPF}_{2}, \mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$, etc. Goodwin ${ }^{8}$ and Roden ${ }^{9}$ have found that there are two possible isomeric products, the cis and trans complexes. The actual mechanism for the reaction is likely to be analogous to normal substitution in a square planar complex, ${ }^{11}$ by formation of an initial five coordinate species, which then loses one of the original substituents to leave the square planar product. The mechanism proposed by Roden ${ }^{9}$ is as follow:
1)

2)

Figure 6.2: Formation of the two possible isomers

The initial product of the reaction is often the trans isomer but it rearranges to give the thermodynamically more favourable product, the cis-isomer. The formation of the trans isomer as the initial product is due to the trans effect, which is often seen in reactions of phosphanes with platinum complexes, ${ }^{12}$ and this affects the reaction of the complex and the nature of the isomeric products.

Another factor could be that if the phosphane approaches on the opposite side of the molecule to the $\mathrm{PEt}_{3}$ group, it is sterically more favourable to form the trans product first. It has been noticed that the time taken for the rearrangement varies with the phosphane. This could be due to:

- during the rearrangement, the steric bulk of the phosphane may influence the approach of the detached $\mathrm{PEt}_{3}$ group. The larger the steric bulk of the phosphane, the more likely the $\mathrm{PEt}_{3}$ group is to coordinate in the trans position. (Figure 6.3)
- the strength of the Pt-P bond may directly influence the formation of the necessary intermediate.

$\mathrm{PEt}_{3}$ attacks forming the trans isomer

Figure 6.3: Rearrangement of the initial trans product to give the thermodynamically more stable cis product.

The intermediate species formed in these types of rearrangements has been shown to be three-coordinate. ${ }^{9}$ This is formed by the loss of the most labile ligand on the platinum centre. The $\mathrm{Pt}-\mathrm{Cl}$ bond are stronger than the Pt-P bonds, and X-ray studies on the compounds have shown that the $\mathrm{PEt}_{3}$ groups bonded to the platinum are more weakly bound than electronegative phosphanes or phosphaalkenes. ${ }^{9}$ This would imply that the $\mathrm{Pt}_{-} \mathrm{PEt}_{3}$ bond is the weakest bond in the complex (the average $\mathrm{Pt}^{2} \mathrm{PEt}_{3}$ bond length is $2.31 \AA$, whereas it is $\sim 2.18 \AA$ for other phosphane ligands containing the strongly electronegative substituents $\mathrm{Ar}, \mathrm{Ar}$ ' or $\mathrm{Ar}{ }^{\prime \prime} 9$ ).

- with diphosphenes

In complexation with diphosphenes, $\eta^{1}$-coordination is preferred. ${ }^{13-15}$ The phosphorus atoms become inequivalent (even in a symmetrical diphosphene) so they are easily detectable in NMR spectroscopy. With unsymmetrical compounds, the coordination takes place at the less hindered phosphorus. ${ }^{5}$

### 6.4 Synthesis of some Platinum-Phosphane Compounds

### 6.4.1 Synthesis of the Pt dimer

## Equation 6.2: Synthesis of trans- $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

$\mathrm{PtCl}_{2}$ was dissolved in a $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution of PhCN at $70^{\circ} \mathrm{C}$, forming a yellow solution. As the solution cooled, yellow crystals formed and were isolated. The product $\left[\mathrm{PtCl}_{2}(\mathrm{PhCN})_{2}\right]$ was then added to a solution of $\mathrm{PEt}_{3}$ in dichloromethane. The resulting compound was dissolved at high temperature in a solution of $\mathrm{PtCl}_{2}$ in $\left(\mathrm{CHCl}_{2}\right)_{2}$ to form the Pt dimer. This was recrystallised from dichloromethane to give yellow crystals. The ${ }^{31} \mathrm{P}$ NMR of the Pt dimer showed a singlet at 11.6 ppm with platinum satellites $\left({ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{Pt}}\right.$ 3833.9 Hz ) (Figure 6.4).

Figure 6.4: ${ }^{3 l} \mathrm{P}$ spectrum of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

The structure has been determined in the department by A.S. Batsanov at 100K (Figure 6.5 ), but was also previously reported ${ }^{16}$ at room temperature.

Figure 6.5: Molecular structure of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

As shown in Table 6.2, the difference in temperature has little effect on the structure.

|  | Room temperature ${ }^{16}$ | 100 K |
| :---: | :---: | :---: |
| $\mathrm{Pt}-\mathrm{P}$ | $2.212(3)$ | $2.2199(11)$ |
| $\mathrm{Pt}-\mathrm{Cl}(1)$ | $2.318(3)$ | $2.3194(11)$ |
| $\mathrm{Pt}-\mathrm{Cl}(2)$ | $2.282(3)$ | $2.2891(11)$ |
| $\mathrm{P}-\mathrm{Pt}-\mathrm{Cl}(1)$ | $89.43(10)$ | $89.03(4)$ |
| $\mathrm{Cl}(1)-\mathrm{Pt}-\mathrm{Cl}(2)$ | $174.59(9)$ | $175.00(4)$ |
| $\mathrm{P}-\mathrm{Pt}-\mathrm{Cl}(1)$ | $179.07(9)$ | $179.02(4)$ |

Table 6.2: Comparison of selected bond distances ( $\AA$ ) and angles $\left(^{\circ}\right)$ of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ at different temperatures.

### 6.4.2 Reaction between $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PCl}$ and Pt dimer

Equation 6.3: Synthesis of trans-[PtCl $\left.{ }_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime \prime} \mathrm{PCl}\right)\right]$

Ar'Ar" PCl was added to a solution of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ in $\left(\mathrm{CHCl}_{2}\right)_{2}$ and the solution was allowed to stir for two days. The ${ }^{31} \mathrm{P}$ NMR shows a doublet with platinum satellites at 21.2 ppm ( ${ }^{1} \mathrm{JPPPt} 2760.3 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{p}} 562.0 \mathrm{~Hz}$ ) corresponding to the $\mathrm{PEt}_{3}$ signal, and another doublet at $94.5 \mathrm{ppm}\left({ }^{1} \mathrm{~J}_{\mathrm{P} . \mathrm{Pt}} 2531.4 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 562.0 \mathrm{~Hz}\right.$ ) for the phosphane. This reveals the complex to be a trans isomer.

The ${ }^{19}$ F NMR spectrum exhibits two doublets at -53.4 (double intensity, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 12.7 \mathrm{~Hz}$ ) and $-56.4\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 61.2 \mathrm{~Hz}\right)$ and a singlet at -62.8 ppm . As explained in chapter 4 , there is a difference in the coupling from the $\mathrm{CF}_{3}$ groups in the Ar ' groups and the one in the Ar " moiety. All the $\mathrm{CF}_{3}$ groups are inequivalent and this explains the difference in the coupling constant from one trifluoromethyl group to the other one. This confirms the results found by Roden. ${ }^{9}$
Stirring for a longer period did not allow the compound to rearrange to the $c i s$-isomer. The NMR spectra did not show any change.

### 6.4.3 Reaction between $\mathbf{A r}{ }_{2} \mathrm{PCl}$ and $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

The Pt dimer was added to a solution of $\mathrm{Ar}{ }_{2} \mathrm{PCl}$ in dichloromethane and the resulting yellow solution was allowed to stir for a few days.

Equation 6.4: Synthesis of trans-[ $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{PCl}\right)\right]$

The ${ }^{31} \mathrm{P}$ NMR showed distinctive peaks with satellites, indicating the coordination of the phosphanes to the platinum. Resonances assignable to the $\mathrm{PEt}_{3}$ group ( $\delta 17.5 \mathrm{ppm},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}$ $562.2 \mathrm{~Hz},{ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2752.4 \mathrm{~Hz}$ ) showed the formation of a trans isomer. The signal for the phosphorus on the phosphane group was detected at 91.0 ppm as a doublet of septets ( ${ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 563.3 \mathrm{~Hz},{ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2685.9 \mathrm{~Hz},{ }^{4} \mathrm{~J}_{\text {P-F }} 8.0 \mathrm{~Hz}$ ).
The ${ }^{19}$ F NMR spectrum exhibited a doublet at $-55.7\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 7.3 \mathrm{~Hz}\right)$ and a singlet at -64.0 ppm.

Figure 6.6: ${ }^{31} \mathrm{P}$ NMR spectrum of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PCl}\right)\right]$

The solution was allowed to stir for two weeks to see if any rearrangement from a trans to a cis isomer occurred, but no changes were observed in the NMR spectrum.

### 6.4.4 Reaction between $\mathrm{Ar}{ }_{2} \mathrm{PH}$ and $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

Equation 6.5: Synthesis of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)_{2}\left(\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{PH}\right)\right]$
$\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ was added to an $\mathrm{Ar}{ }_{2} \mathrm{PH}$ solution in dichloromethane at room temperature. The resulting yellow solution was stirred for a few hours. The ${ }^{31} \mathrm{P}$ NMR spectrum showed the formation of the trans isomer, with two doublets with Pt satellites at 93.8 and 16.4 ppm.

| ${ }^{31} \mathrm{P}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{PEt}_{3}$ | P | $0-\mathrm{CF}_{3}$ | ${ }^{19} \mathrm{~F}$ |
| $\delta(\mathrm{ppm})$ | 16.4 | 93.8 | -57.8 | -63.9 |
| ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}}(\mathrm{Hz})$ | 2551.7 | 2676.8 | ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 2.8$ |  |
| ${ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}(\mathrm{Hz})$ | 501.4 | 501.4 |  |  |

Table 6.3: $\delta^{31} \mathrm{P}$ and ${ }^{19} \mathrm{~F}$ NMR data for $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{PH}\right)\right]$

### 6.4.5 Reaction between $\mathrm{ArPBr}_{2}$ and $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

Equation 6.6: Synthesis of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{ArPBr}_{2}\right)\right]$

The Pt dimer was added to a solution of $\mathrm{ArPBr}_{2}$ in dichloromethane and the resulting yellow solution was allowed to stir for a month. NMR samples were made regularly to check any change in the reaction mixture.
The first complex formed was the cis-isomer. The ${ }^{31} \mathrm{P}$ NMR spectrum showed, for the $\mathrm{PEt}_{3}$ group, a doublet with satellites at $16.6 \mathrm{ppm}\left({ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2966.4 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 13.4 \mathrm{~Hz}\right)$, and the signal corresponding to the phosphorus from $\mathrm{ArPBr}_{2}$ was a septet with platinum satellites at $90.5 \mathrm{ppm}\left({ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 5287.5 \mathrm{~Hz},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 11.8 \mathrm{~Hz}\right.$ ). The ${ }^{19} \mathrm{~F}$ NMR showed a doublet with
platinum satellites at $-49.2 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 12.4 \mathrm{~Hz},{ }^{5} \mathrm{~J}_{\mathrm{Pt-F}} 30.3 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right)$, and a singlet at -64.0 (3F, $p-\mathrm{CF}_{3}$ ).
After a week new peaks started to appear in the spectra: in the ${ }^{31} \mathrm{P}$ NMR spectrum a doublet at $14.4 \mathrm{ppm}\left({ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 791.8 \mathrm{~Hz},{ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{Pt}} 2731.6 \mathrm{~Hz}\right)$, indicating the presence of a transisomer, together with a weak doublet of multiplets at $92.4 \mathrm{ppm}\left({ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 792.4 \mathrm{~Hz}\right)$. Unfortunately, the signal was too weak to be able to see any platinum satellites. The ${ }^{19} \mathrm{~F}$ NMR spectrum displayed a doublet with platinum satellites at $-49.8 \mathrm{ppm} \cdot\left({ }^{4} \mathrm{~J}_{\mathrm{P} . \mathrm{F}} 13.7 \mathrm{~Hz}\right.$, ${ }^{5} \mathrm{~J}_{\mathrm{Pt}-\mathrm{F}} 30.5 \mathrm{~Hz}$ )

Spectra were recorded regularly and a number of new signals became visible in the phosphorus spectra, notably some multiplets at $145.8\left({ }^{4} \mathrm{~J}_{\text {P-F }} 61.0 \mathrm{~Hz}\right), 138.2\left({ }^{4} \mathrm{~J}_{\text {P-F }} 62.5\right.$ $\mathrm{Hz})$, and $130.2\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 63.0 \mathrm{~Hz}\right) \mathrm{ppm}$. The chemical shifts and the coupling constants corresponding to these multiplets suggest the presence of $\mathrm{ArPCl}_{2}, \mathrm{ArPBrCl}$ and $\mathrm{ArPBr}_{2}$ respectively in solution. The ${ }^{19} \mathrm{~F}$ NMR spectrum confirms this hypothesis, with the presence of doublets at $-53.0,-53.4$ and -53.5 ppm with coupling constants of $60.9,61.6$ and 62.9 Hz respectively. The existence of these species implies that halogen exchange occurs in solution between the chlorine of the platinum dimer and the bromine atoms of the phosphane.

Attempts to grow crystals out of the solution gave orange crystals (not suitable for X-ray diffraction). The ${ }^{31} \mathrm{P}$ NMR of these crystals consisted of a singlet at 10.9 ppm with Pt satellites ( ${ }^{1}{ }_{\mathrm{Pt} \text { t-p }} 3701 \mathrm{~Hz}$ ) corresponding to the chemical shifts and coupling constant found in $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$. This also shows that a $\mathrm{Br} / \mathrm{Cl}$ exchange has occurred.

Usually, a cis-complex is the most thermodynamically stable compound and does not rearrange itself to the trans isomer. Initial formation of a cis-complex, however, followed by halogen exchange, allows the formation of a trans complex.

### 6.4.6 Reaction between $\mathrm{Ar}{ }^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2}$ and $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

$\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ was added to a solution of $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2}$ in dichloromethane. The solution was stirred for three weeks until no change was observed in the spectra.

Initially, the ${ }^{31} \mathrm{P}$ NMR spectrum showed the formation of two cis-isomers. (Table 6.4)
Unfortunately, the signals from coordinated $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ were to weak to allow determination of ${ }^{1} \mathrm{~J}_{\text {Pt-P. }}$

|  | $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ |  | $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{PEt}_{3}$ | P | $\mathrm{PEt}_{3}$ | P |
| $\delta(\mathrm{ppm})$ | 15.7 | 92.2 | 15.4 | 89.0 |
| ${ }^{1} \mathrm{~J}_{\text {Pt-P }}(\mathrm{Hz})$ | 3004 | 5274.1 | 3174.7 |  |
| ${ }^{2} \mathrm{~J}_{\text {P-P }}(\mathrm{Hz})$ | 13.9 | 14.2 | 10.8 |  |

Table 6.4: Initial $\delta^{31} P$ NMR data for $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]$ and

$$
\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(A r^{\prime \prime} P B r_{2}\right)\right]
$$

In the ${ }^{19} \mathrm{~F}$ NMR spectrum, two doublets and one singlet were observed.

|  | $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ | $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ |  |
| :---: | :---: | :---: | :---: |
|  |  | $o-\mathrm{CF}_{3}$ | $p-\mathrm{CF}_{3}$ |
| $\delta(\mathrm{ppm})$ | -49.0 | -55.5 | -63.4 |
| ${ }^{4} \mathrm{~J}_{\text {P-F }}(\mathrm{Hz})$ | 10.6 | 6 |  |
| ${ }^{5} \mathrm{~J}_{\text {Pt-F }}(\mathrm{Hz})$ | 28.8 | $?$ |  |

Table 6.5: $\delta^{19} \mathrm{~F}$ NMR data for $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]$ and $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime \prime}{ }^{\left.P B r_{2}\right)}\right]\right.$

After a few days, many other peaks appeared in the spectrum. In the $\mathrm{PEt}_{3}$ chemical shift area, ( $\sim 11-17 \mathrm{ppm}$ ), six different signals with Pt satellites were distinguished but these could not be assigned (Table 6.6). The observation of new signals at 69.7 (septet) and 67.7 (quartet) ppm, with coupling constants of 65.5 and 61.3 Hz respectively, suggests the possible formation of $\mathrm{Ar}{ }^{\prime} \mathrm{PClBr}$ and $\mathrm{Ar}{ }^{\prime} \mathrm{PClBr}$. The ${ }^{19} \mathrm{~F}$ NMR spectrum also contained a number of new doublets.

| $\delta(\mathrm{ppm})$ | ${ }^{1} \mathrm{~J}_{\text {Pt-P }}(\mathrm{Hz})$ | ${ }^{2} \mathrm{~J}_{\text {P-P }}(\mathrm{Hz})$ | Isomer |
| :---: | :---: | :---: | :---: |
| 15.4 | 3210.2 | 13.7 | cis |
| 12.9 | 2573.5 | 561.12 | trans |
| 13.4 | 3204.1 | 15.2 | cis |
| 13.0 | 3204.1 | 10.7 | cis |

Table 6.6: ${ }^{31}$ P chemical shifts and coupling constants of different products of the reaction

$$
\text { between } \mathrm{Ar}^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2} \text { and }\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}
$$

As already discussed in the reaction with $\mathrm{ArPBr}_{2}$ some $\mathrm{Cl} / \mathrm{Br}$ exchange seems to occur when reacting the Pt chloride dimer with a bromophosphane.

### 6.4.7 Reaction between $\mathrm{Ar}_{2} \mathrm{PBr}$ and $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

Equation 6.7: Synthesis of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{PBr}\right)\right]$

A solution of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ in dichloromethane was added to a solution of $\mathrm{Ar}{ }_{2} \mathrm{PBr}$. The ${ }^{31} \mathrm{P}$ NMR spectrum showed the formation of a trans complex: $\delta 12.9 \mathrm{ppm}\left(\mathrm{d},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 562.5\right.$ $\mathrm{Hz},{ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{Pt}} 2654 \mathrm{~Hz}$ ) (Figure 6.7); $\delta 86.3 \mathrm{ppm}\left(\mathrm{d}\right.$ of septets, ${ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 562.3 \mathrm{~Hz},{ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2637.6 \mathrm{~Hz}$, ${ }^{4} \mathrm{~J}_{\text {P-F }} 5.5 \mathrm{~Hz}$ ) (Figure 6.8).

Figure 6.7: ${ }^{31} \mathrm{P}$ NMR spectrum of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}{ }^{\prime \prime}{ }_{2} \mathrm{PBr}\right)\right]$. (Phosphane region)

Figure 6.8: ${ }^{31} \mathrm{P}$ NMR spectrum of the reaction between $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{PBr}\right)\right]\left(\mathrm{PEt}_{3}\right.$ region)

The ${ }^{19} \mathrm{~F}$ NMR spectrum displayed a doublet with platinum satellites at $-55.3\left({ }^{4}{ }^{\mathrm{J}-\mathrm{F}}{ }^{6.0 \mathrm{~Hz})}\right.$ and a singlet at -63.8 ppm .
This sample also showed some halogen exchange after being stirred for a while.

All the bromophosphane derivatives reacted with the "platinum dimer" seem to undergo some exchange between the bromine and the chlorine atoms of the platinum compounds. To prevent this exchange from happening, the bromophosphane compounds were reacted with the platinum bromide dimer $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$.

### 6.4.8 Synthesis of $\left[\mathrm{PtBr}_{\mathbf{2}}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

$\mathrm{PtBr}_{2}$ was dissolved in a solution of PhCN at $70^{\circ} \mathrm{C}$, forming a yellow solution. As the solution cooled yellow crystals formed and were isolated. The product, $\left[\mathrm{PtBr}_{2}(\mathrm{PhCN})_{2}\right]$, was then added to a solution of $\mathrm{PEt}_{3}$. The resulting compound was then dissolved at high temperature in a solution of $\mathrm{PtBr}_{2}$ in $\left(\mathrm{CHCl}_{2}\right)_{2}$ to form the Pt dimer. The ${ }^{31} \mathrm{P}$ NMR of the Pt dimer showed a singlet at 10.9 ppm with platinum satellites ( ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{pt}} 3701 \mathrm{~Hz}$ ). The chemical shift and coupling constant are very similar to those found in $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$. Crystals were submitted for X-ray diffraction and the structure was ascertained at 120 K . (Figure 6.9). Selected bond distances and angles are listed in Table 6.7 and compared with the values found for $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$. The $\mathrm{Pt}-\mathrm{P}$ bond distances are slightly longer in the bromide derivative, due to more steric demand.

Figure 6.9: Molecular structure of $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

|  | $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ at | $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ |

Table 6.7: Comparison of crystal data between $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ and $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

### 6.4.9 Reaction between $\mathrm{ArPBr}_{2}$ and $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

A solution of $\left[\mathrm{PBrr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added to a solution of $\mathrm{ArPBr}_{2}$ in dichloromethane. The solution was stirred for 6 hours and NMR spectra were monitored regularly for four weeks. After just a few hours, the spectrum did not show any signs of the formation of a complex. After 10 days, the ${ }^{31} \mathrm{P}$ NMR spectrum displayed peaks corresponding to the presence of a cis-isomer.

| ${ }^{31} \mathrm{P}$ |  | ${ }^{19} \mathrm{~F}$ |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{PEt}_{3}$ | P | $o-\mathrm{CF}_{3}$ | $p-\mathrm{CF}_{3}$ |
| $\delta(\mathrm{ppm})$ | 15.5 | 79.6 | -52.9 | -64.1 |
| ${ }^{1} \mathrm{~J}_{\mathrm{P} t \mathrm{P}}(\mathrm{Hz})$ | 3221.1 | 5681.8 | ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 4.5$ |  |
| ${ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}(\mathrm{Hz})$ | 18.4 | 18.3 |  |  |

Table 6.8: $\delta^{31} \mathrm{P}$ and ${ }^{19} \mathrm{~F}$ NMR data for $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{ArPBr}_{2}\right)\right]$

### 6.4.10 Reaction between $\mathbf{A r "}{ }_{2} \mathrm{PBr}$ and $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

Equation 6.8: Synthesis of $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PBr}\right)\right]$

A solution of $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added to a solution of $\mathrm{Ar}{ }_{2} \mathrm{PBr}$ in dichloromethane. The spectrum ran after just a few hours showed the formation of a trans complex but some peak from the starting material remained. After 10 days, the ${ }^{31}$ P NMR spectrum displayed peaks corresponding to the presence of a trans-isomer

|  | ${ }^{31} \mathrm{P}$ |  | ${ }^{19} \mathrm{~F}$ |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{PEt}_{3}$ | P | $0-\mathrm{CF}_{3}$ | $p-\mathrm{CF}_{3}$ |
| $\delta(\mathrm{ppm})$ | 12.0 | 72.0 | -54.7 | -63.9 |
| ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}}(\mathrm{Hz})$ | 2691.8 | 2516.5 | ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 2.7$ |  |
| ${ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}(\mathrm{Hz})$ | 562.8 | 562.4 |  |  |

Table 6.9: $\delta^{31} \mathrm{P}$ and ${ }^{19} \mathrm{~F}$ NMR data for $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime \prime}{ }_{2} \mathrm{PBr}\right)\right]$

The cis-isomer has not been formed.

### 6.4.11 Reaction between $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ and $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

A solution of $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added to a solution of $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2}$ in dichloromethane. The ${ }^{31} \mathrm{P}$ NMR spectrum showed a number of peaks, indicating the formation of at least three complexes, two cis-isomers and a trans-isomer.

|  | $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ cis |  | $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ cis |  | $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ trans |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{PEt}_{3}$ | P | $\mathrm{PEt}_{3}$ | P | $\mathrm{PEt}_{3}$ | P |
| $\delta(\mathrm{ppm})$ | 13.5 | 113.4 | 14.1 |  | 11.9 | 108.6 |
| ${ }^{1} \mathrm{~J}_{\mathrm{Pt-P}}(\mathrm{~Hz})$ | 3211.5 |  | 3201.7 |  | 2846.5 | 2756.7 |
| ${ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}(\mathrm{Hz})$ | 11.5 |  | 11.6 |  | 682.7 | 682.3 |

Table 6.10: $\delta{ }^{3 l} P$ NMR data for $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2}\right)\right]$ and $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr} r_{2}\right)\right]$

Because of weak signals, ${ }^{1} \mathrm{~J}_{\text {Pt-P }}$ for the cis complexes could not be determined. The signals corresponding to the phosphorus of the phosphane ligands have not been observed for cis-Ar" $\mathrm{PBr}_{2}$.

Signals corresponding to $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ were still visible in the ${ }^{31} \mathrm{P}$ and ${ }^{19} \mathrm{~F}$ NMR spectra. $\mathrm{Ar}{ }^{\prime} \mathrm{PBr}_{2}$ formed a cis and a trans complexes whereas $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ only formed a trans complex. ${ }^{19}$ F NMR data are listed in Table 6.11.

|  | $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ cis |  | $\mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2}$ trans |  | $\mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2}$ cis |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $o-\mathrm{CF}_{3}$ | $o-\mathrm{CF}_{3}$ | $p-\mathrm{CF}_{3}$ | $o-\mathrm{CF}_{3}$ | $p-\mathrm{CF}_{3}$ |  |
| $\delta(\mathrm{ppm})$ | -52.8 | -47.6 | -62.7 | -50.8 | -63.7 |  |

| ${ }^{5} \mathrm{~J}_{\mathrm{P} t-\mathrm{F}}(\mathrm{Hz})$ | 30.3 | 32.5 |  |  |  |  |

Table 6.11: $\delta^{19} \mathrm{~F}$ data for $\left[\mathrm{PBrl}_{2}\left(\mathrm{PEt}_{3}\right)\left(A r^{\prime \prime} \mathrm{PBr}_{2}\right)\right]$ and $\left[\mathrm{PBrl}_{2}\left(\mathrm{PEt}_{3}\right)\left(A r^{\prime} P B r_{2}\right)\right]$

### 6.5 Attempted synthesis of Platinum-Arsane Compounds

$\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ was added to a series of arsenic derivatives such as $\mathrm{ArAsCl}_{2}, \mathrm{Ar}_{2} \mathrm{AsCl}$ and Ar'Ar"AsCl. No reaction was apparent from the ${ }^{19} \mathrm{~F}$ NMR spectra, even after refluxing over a number of days.

The "platinum dimer" does not seem to coordinate to these arsenic derivatives, although many As-Pt complexes have been reported in the literature.

### 6.6 Discussion

### 6.6.1 Change in the chemical shifts

Chemical shifts upon bonding to platinum are listed in Tables 6.12 and 6.13.

| Phosphane | Isomer | Phosphane | $\delta$ before bonding (ppm) | $\delta$ after bonding (ppm) |
| :---: | :---: | :---: | :---: | :---: |
| Ar'Ar' ${ }^{\text {PCl }}$ | trans | Ar'Ar' PCl | 67.3 | 94.5 |
| Ar" 2 PCl | trans | Ar" $2_{2} \mathrm{PCl}$ | 68.3 | 91.0 |
| Ar" ${ }_{2} \mathrm{PH}$ | trans | $\mathrm{Ar}^{2}{ }_{2} \mathrm{PH}$ | -48.7 | 93.8 |
| Ar" ${ }_{2} \mathrm{PBr}$ | trans | $\mathrm{Ar}{ }_{2} \mathrm{PBr}$ | 57.4 | 86.3 |
| $\mathrm{ArPBr}_{2}$ | cis | $\mathrm{ArPBr}_{2}$ | 130.1 | 90.5 |
| $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ | cis | Ar' $\mathrm{PBr}_{2}$ | 134.1 | 92.2 |
| Ar" ${ }^{\text {PBr }}$ | cis | $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ | 141.0 | 89.0 |

Table 6.12: Comparison of the chemical shifts upon bonding to the chloro-dimer

| Phosphane | Isomer | Phosphane | $\delta$ before bonding <br> $(\mathrm{ppm})$ | $\delta$ after bonding <br> $(\mathrm{ppm})$ |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{Ar}^{\prime}{ }_{2} \mathrm{PBr}$ | trans | $\mathrm{Ar}{ }_{2} \mathrm{PBr}$ | 57.4 | 72.0 |
| $\mathrm{ArPBr}_{2}$ | cis | $\mathrm{ArPBr}_{2}$ | 130.1 | 79.6 |
| $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ | cis | $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ | 134.1 | 113.4 |
| $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ | trans | $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ | 141.0 | 108.6 |

Table 6.13: Comparison of the chemical shifts upon bonding to bromo-dimer

When bonding to platinum, the chemical shift of the monosubstituted phosphanes moves to a lower frequency. There is an increase of electron density at the phosphorus centre, due to the back donation of electrons from the platinum to the phosphorus.

Figure 6.10: Back donation of electrons from the metal to the phosphorus atom

When the platinum dimer is coordinated to a disubstituted derivative, the chemical shift moves to a higher frequency. The presence of two aryl rings will increase the electronwithdrawing effect, and therefore decrease the electron density on the phosphorus.
The difference in chemical shifts for $\mathrm{Ar}_{2}{ }_{2} \mathrm{PH}$ is much larger than in the other cases. There, the dominant factor could be the $\sigma$-bonding. The hydrogen atom has approximately the same electronegativity as phosphorus, ${ }^{17}$ and will not have back donation from the platinum atom.

All phosphorus compounds containing two bulky substituents (Ar' or Ar") form transisomers with the platinum dimer. No rearrangement to the cis-isomer has been observed. This is probably due to the steric hindrance imposed by the presence of the two fluoroxyl groups.

### 6.6.2 Comparison of the coupling constants

The coupling constants ( ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}$ and $\left.{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}\right)$ of the prepared complexes are listed in Table 6.14 .

The magnitude of ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{Pt}}$ in phosphane complexes is proportional to the s-character of the phosphorus lone pair. ${ }^{18}$ When the second phosphorus ligand is cis to $\mathrm{PEt}_{3}$, the $\mathrm{J}_{\mathrm{Pt-P}}$ value is larger than when the two phosphorus ligands have a trans configuration. In the latter case, the ligands compete for electrons, giving a trans influence ${ }^{19}$ and hence reducing the ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{Pt}}$ coupling.
The sequence of phosphorus ligands, in term of increasing ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}}$ values, for the cis complexes is as follows:

| $\mathrm{ArPH}_{2}$ | $<\mathrm{Ar}^{\prime} \mathrm{Ar} \mathrm{MPCl}^{\prime}$ | $<\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ | $<\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}$ | $<\mathrm{Ar}^{\prime \prime} \mathrm{PCl}_{2}$ | $<\mathrm{ArPBr}_{2}$ | $<\mathrm{ArPCl}_{2}$ | $<\mathrm{Ar}^{\prime} \mathrm{PF}_{2}$ | $<\mathrm{ArPF}_{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3809 | 4783 | 5260 | 5274 | 5488 | 5491 | 5511 | 6195 | 6252 |

$$
\begin{aligned}
& \mathrm{H}<\mathrm{Cl} \sim \mathrm{Br}<\mathrm{F} \\
& \mathrm{Ar}^{\prime}<\mathrm{Ar}><\mathrm{Ar}
\end{aligned}
$$

The coupling constant generally increases with the electronegativity of the atom(s) X bonded to the phosphorus atom. The largest coupling constant appears in the compounds where there is the greatest electron withdrawal from the groups attached to the phosphorus, with a ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}}$ range from 3800 to 6200 Hz . This increase is due to the amount of back donation occurring from the platinum to the phosphorus atom.

| Compounds | Isomer | ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{Pt}}(\mathrm{Hz})$ | ${ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}(\mathrm{Hz})$ | Ref |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{ArPCl}_{2}$ | $\begin{gathered} \text { cis } \\ \text { trans } \end{gathered}$ | $\begin{aligned} & \hline 5511.0 \\ & 2885.8 \end{aligned}$ | 679.0 | 8 |

| $\mathrm{Ar}^{\prime} \mathrm{PF}_{2}$ | cis <br> trans | $\begin{gathered} 6194.8 \\ 2723 \end{gathered}$ | $\begin{gathered} 42.6 \\ 690.6 \end{gathered}$ | 9 |
| Ar'Ar''PCl | $\begin{gathered} \text { cis } \\ \text { trans } \end{gathered}$ | $\begin{aligned} & 4783.3 \\ & 2531.4 \end{aligned}$ | 562.0 | $9$ <br> This work |
| $\mathrm{Ar}{ }_{2} \mathrm{PCl}$ | trans | 2685.9 | 563.3 | This work |
| Ar" ${ }_{2} \mathrm{PH}$ | trans | 2676.8 | 501.4 | This work |
| $\mathrm{Ar}{ }_{2} \mathrm{PBr}$ | trans | 2637.6 | 562.3 | This work |

Table 6.14: Coupling constant data for some Pt(II) complexes of phosphanes with Ar, Ar' or Ar" substituents

For the first time in this kind of complex, coupling between fluorine atoms and the platinum has been observed in the ${ }^{19} \mathrm{~F}$ NMR spectrum. The ${ }^{5} \mathrm{~J}_{\mathrm{Pt}-\mathrm{F}}$ is about 30 Hz .
Some $\mathrm{J}_{\mathrm{Pt}-\mathrm{F}}$ couplings constant have been reported in the literature. For a trifluoromethyl triphospholene ${ }^{\text {a }}$ complex, a through space Pt---F interaction is observed with a coupling constant of $11 \mathrm{~Hz} .{ }^{20}$ Some short P---F contacts have been observed in all the structurally characterised phosphane complexes, and it is possible that the $\mathrm{J}_{\mathrm{Pt}-\mathrm{F}}$ coupling come from some through space interaction between the fluorines of the $o-\mathrm{CF}_{3}$ groups and the Pt atom. This could be confirmed by X-ray analysis, but unfortunately all crystals grown were not suitable.

### 6.7 Experimental

### 6.7.1 Introduction

- NMR spectroscopy

The ${ }^{31} \mathrm{P}$ NMR spectra of phosphorus-containing starting materials were checked, to confirm the absence of any major impurities. ${ }^{19} \mathrm{~F}$ NMR spectra were recorded on a Varian Mercury 200 or Varian VXR 400 Fourier-transform spectrometer at 188.18 and 376.35 MHz respectively. ${ }^{31} \mathrm{P}$ NMR spectra were recorded on the same instruments at 80.96 or 161.91 MHz . Chemical shifts were measured relative to external $\mathrm{CFCl}_{3}\left({ }^{19} \mathrm{~F}\right)$ or $85 \%$ $\mathrm{H}_{3} \mathrm{PO}_{4}\left({ }^{31} \mathrm{P}\right)$, with the higher frequency direction taken as positive.

- X-ray crystallography

Single crystal X-ray diffraction experiments were carried out at low temperature, 100 to 120 K , using graphite monochromated Mo $\mathrm{K} \alpha$ radiation ( $\lambda=0.71073$ ) on a Bruker SMART (CCD 1 K area detector) diffractometer equipped with a Cryostream $\mathrm{N}_{2}$ flow cooling device. ${ }^{21}$ Series of narrow $\omega$-scans $\left(0.3^{\circ}\right)$ were performed at several $\varphi$-settings in such a way as to cover a sphere of data to a maximum resolution between 0.70 and 0.77 $\AA$. Cell parameters were determined and refined using the SMART software, ${ }^{22}$ and raw

[^8]frame data were integrated using the SAINT program. ${ }^{23}$ The structures were solved by direct methods and refined by full-matrix least squares on $\mathrm{F}^{2}$ using SHELXTL software. ${ }^{24}$

### 6.7.2 Synthesis of cis- $\left[\mathrm{PtCl}_{2}(\mathrm{PbCN})_{2}\right]$

$$
2 \mathrm{PhCN}+\mathrm{PtCl}_{2} \longrightarrow c i s-\left[\mathrm{PtCl}_{2}(\mathrm{PhCN})\right]_{2}
$$

$\mathrm{PtCl}_{2}(2.09,7.8 \mathrm{mmol})$ was added to $\mathrm{PhCN}(20 \mathrm{ml})$ and was heated to $100^{\circ} \mathrm{C}$ for half an hour, yielding a bright yellow solution. This solution was cooled down and a yellow precipitate appeared. The solution was then filtered and the solid washed with petroleum ether and dried under vacuum. Yield 3.0 g ( $95 \%$ ).

Elemental analysis; Calc C 35.60 , H 1.91, N 5.94\%; Found C 35.63 , H 2.10 , N $5.93 \%$

### 6.7.3 Synthesis of cis-[ $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)_{2}\right]$

$\mathrm{PtCl}_{2}(\mathrm{PhCN})_{2}(2.2 \mathrm{~g}, 4.66 \mathrm{mmol})$ was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{ml}) . \mathrm{PEt}_{3}(1.1 \mathrm{~g}, 2.86 \mathrm{ml}$, 9.33 mmol ) was added to the solution and the reaction was stirred during 3 hours. Solvent was removed in vacuo and the solid obtained washed twice with hexanes ( 20 ml ). A white solid appeared which was dried in vacuo. Yield 2.05 g (88\%) Elemental analysis: Calc C 28.70, H 6.02 \%; Found C 29.33, H 6.19 \%

### 6.7.4 Synthesis of trans-[ $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

$$
\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)_{2}+\mathrm{PtCl}_{2} \longrightarrow \text { trans }-\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}
$$

Cis $-\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)_{2}(2.04 \mathrm{~g}, 2.6 \mathrm{mmol})$ was added to a solution of $\mathrm{PtCl}_{2}(1.46 \mathrm{~g}, 5.3 \mathrm{mmol})$ dissolved in $\left(\mathrm{CHCl}_{2}\right)_{2}$ and heated to $150^{\circ} \mathrm{C}$ during 2 hours. After cooling, yellow crystals appeared. The solvent was removed under vacuum and the crystals were purified by recrystallisation from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Yield 3.15 g ( $77.5 \%$ )
Elemental analysis: Calc C 18.71 , H 3.91\%; Found C 18.74, H 3.95\%
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 11.6$ (singlet with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 3833.9 \mathrm{~Hz}$ ) ppm.

### 6.7.5 Synthesis of trans-[ $\left.\mathrm{PtCl}_{\mathbf{2}}\left(\mathrm{PEt}_{3}\right)_{2}\left(\mathrm{Ar}^{\prime} \mathrm{Ar}{ }^{\prime} \mathrm{PCl}\right)\right]$

A solution of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}(0.68 \mathrm{~g}, 0.10 \mathrm{mmol})$ in dichloromethane was added to a solution of $\mathrm{Ar}^{\prime} \mathrm{Arr}^{\prime \prime} \mathrm{PCl}(0.1 \mathrm{~g}, 0.2 \mathrm{mmol})$ in dichloromethane. The solution was stirred overnight.
${ }^{31} \mathbf{P}$ NMR: $\delta 94.5$ (d of septets with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{Pt}} 2531.4 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 562.0 \mathrm{~Hz}$ ), $21.2(\mathrm{~d}$ with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2760.3 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 562.0 \mathrm{~Hz}$ ) ppm; ${ }^{19}$ F NMR: $\delta-53.4\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 12.7\right.$ $\left.\mathrm{Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-56.4\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 61.2,3 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-62.8\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 6.7.6 Synthesis of trans-[ $\left.\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2} \mathbf{P C l}\right)\right]$

$$
\mathrm{Ar}_{2} \mathrm{PCl} \xrightarrow{\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}} \quad\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2} \mathrm{PCl}\right)\right]
$$

A solution of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}(0.68 \mathrm{~g}, 0.10 \mathrm{mmol})$ in dichloromethane was added to a solution of $\mathrm{Ar}{ }^{2} \mathrm{PCl}(0.10 \mathrm{~g}, 0.20 \mathrm{mmol})$ in dichloromethane. The solution was stirred overnight.
${ }^{31} \mathbf{P}$ NMR: $\delta 91.0$ (d of septets with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 2685.9 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 563.3 \mathrm{~Hz},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 8.0$ Hz ), 17.5 (d with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2752.4 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 562.2 \mathrm{~Hz}$ ) ppm; ${ }^{19}$ F NMR: $\delta-55.7(\mathrm{~d}$, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 7.3 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), $-64.0\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 6.7.7 Synthesis of $\operatorname{trans}-\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2} \mathrm{PH}\right)\right]$

$$
\mathrm{Ar}_{2}{ }_{2} \mathrm{PH} \xrightarrow{\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}}\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2} \mathrm{PH}\right)\right]
$$

$\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}(0.36 \mathrm{~g}, 0.43 \mathrm{mmol})$ was added to a solution of $\mathrm{Ar}{ }_{2} \mathrm{PH}(0.40 \mathrm{~g}, 0.87 \mathrm{mmol})$ in dichloromethane. The solution was stirred overnight.
${ }^{31} \mathrm{P}$ NMR $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \delta 93.8$ (d with Pt satellites, ${ }^{1} \mathrm{~J}_{\text {P-Pt }} 2676.8 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 501.4 \mathrm{~Hz}$ ), 16.4 (d with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt-P}} 2551.7 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 501.4 \mathrm{~Hz}$ ) ppm; ${ }^{19}$ F NMR: $\delta-57.8\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 2.8 \mathrm{~Hz}\right.$, $6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), -63.9 (s, 6F, $p-\mathrm{CF}_{3}$ )

### 6.7.8 Synthesis of cis-[ $\left.\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{ArPBr}_{2}\right)\right]$

$\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}(0.37 \mathrm{~g}, 0.48 \mathrm{mmol})$ was added to a solution of $\mathrm{ArPBr}_{2}(0.45 \mathrm{~g}, 0.96$ $\mathrm{mmol})$. The solution was stirred for a month.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 90.5$ (septet with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 5287.5 \mathrm{~Hz},{ }^{4} \mathrm{~J}_{\mathrm{P} \text {-F }} 11.8 \mathrm{~Hz}$ ), 16.6 (d with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2966.4 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 13.4 \mathrm{~Hz}$ ) ppm; ${ }^{19} \mathrm{~F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-49.2$ (d with Pt satellites, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 12.4 \mathrm{~Hz},{ }^{5} \mathrm{~J}_{\mathrm{Pt}-\mathrm{F}} 30.3 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), $-64.0\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 6.7.9 Synthesis of cis-[ $\left.\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathbf{P B r}_{2}\right)\right]$ and cis- $\left[\mathrm{PtCl}_{\mathbf{2}}\left(\mathbf{P E t}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]$

$\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}+\mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2} \xrightarrow{\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}}\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]+\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2}\right)\right]$
$\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}(0.22 \mathrm{~g}, 0.42 \mathrm{mmol})$ was added to a solution of $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime} \mathrm{PBr}_{2}(0.34 \mathrm{~g}$, 0.84 mmol ) in dichloromethane. The solution was stirred during a few days. ${ }^{31} \mathbf{P}$ NMR

 with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{Pt}} 5274.1 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 14.2 \mathrm{~Hz}$ ), 15.7 (d with Pt satellites, ${ }^{1}{ }^{1}{ }^{\text {P-Pt }} 3004 \mathrm{~Hz}$,
 $\left.o-\mathrm{CF}_{3}\right),-63.4\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm} ; \underline{c i s-\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]: \delta-49.0\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 10.6 \mathrm{~Hz},{ }^{5} \mathrm{~J}_{\mathrm{Pt}} .\right.}$ $\left.{ }_{\mathrm{F}} 28.8 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 6.7.10 Synthesis of trans-[ $\left.\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2}{ }_{2} \mathrm{PBr}\right)\right]$

$$
\mathrm{Ar}_{2}{ }_{2} \mathrm{PBr} \xrightarrow{\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}}\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2}{ }_{2} \mathrm{PBr}\right)\right]
$$

$\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}(0.17 \mathrm{~g}, 0.24 \mathrm{mmol})$ was added to a solution of $\mathrm{Ar}{ }_{2}{ }_{2} \mathrm{PBr}(0.26 \mathrm{~g}, 0.48 \mathrm{mmol})$ in dichloromethane. The solution was stirred during three days.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \delta 86.3$ (d of septets with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2637.6 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 562.3 \mathrm{~Hz}$, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 5.5 \mathrm{~Hz}$ ), 12.9 (d with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2654.0 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P} . \mathrm{P}} 562.5 \mathrm{~Hz}$ ) ppm; ${ }^{19}$ F NMR: $\delta-55.3$ (d with Pt satellites, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 7.5 \mathrm{~Hz},{ }^{5} \mathrm{~J}_{\mathrm{Pt}-\mathrm{F}} 75.8 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), $-63.8\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right)$

### 6.7.11 Synthesis of cis- $\left[\mathrm{PtBr}_{2}\left(\mathrm{PhCN}_{2}\right]\right.$

$$
2 \mathrm{PhCN}+\mathrm{PtBr}_{2} \longrightarrow c i s-\left[\mathrm{PtBr}_{2}(\mathrm{PhCN})\right]_{2}
$$

$\mathrm{PtBr}_{2}(1.48 \mathrm{~g}, 4.2 \mathrm{mmol})$ was added to $\mathrm{PhCN}(10 \mathrm{ml})$ and was heated to $100^{\circ} \mathrm{C}$ for half an hour, yielding a bright orange solution. This solution was cooled down and a yellow precipitate appeared. The solution was then filtered and the solid washed with petroleum ether and dried under vacuum. Yield $1.89 \mathrm{~g}(81 \%)$.
Elemental analysis for $\mathrm{C}_{14} \mathrm{H}_{5} \mathrm{Br}_{2} \mathrm{~N}_{2} \mathrm{Pt}$ (556): Calc C 30.27, H 1.44, N $5.01 \%$; Found C 30.21, H 1.79, N 4.95\%.

### 6.7.12 Synthesis of cis-[ $\left.\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)_{2}\right]$

$\mathrm{PtBr}_{2}\left(\mathrm{PhCN}_{2}(1.77 \mathrm{~g}, 3.18 \mathrm{mmol})\right.$ was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{ml}) . \mathrm{PEt}_{3}(1.75 \mathrm{~g}, 2.18 \mathrm{ml}$, 6.36 mmol ) was added to the solution and the reaction was stirred during 3 hours. Solvent was removed in vacuo and the solid obtained washed twice with hexanes ( 20 ml ). A white solid appeared which was dried in vacuo. Yield 1.48 g (83\%).
Elemental analysis for $\mathrm{C}_{12} \mathrm{H}_{30} \mathrm{Br}_{2} \mathrm{P}_{2} \mathrm{Pt}$ (591): Calc C 24.38 , H 5.11\%; Found C $28.26, \mathrm{H}$ 6.30\%.
6.7.13 Synthesis of $\operatorname{trans}-\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$

$$
\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)_{2}+\mathrm{PtBr}_{2} \longrightarrow \text { trans- }\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}
$$

Cis $-\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)_{2}(1.45 \mathrm{~g}, 2.5 \mathrm{mmol})$ was added to a solution of $\mathrm{PtBr}_{2}(1.03 \mathrm{~g}, 2.9 \mathrm{mmol})$ dissolved in $\left(\mathrm{CHCl}_{2}\right)_{2}$ and heated to $150^{\circ} \mathrm{C}$ during 4 hours. After cooling, yellow crystals
appeared. The solvent was removed under vacuum and the crystals were purified by recrystallisation from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Yield 2.18 (79\%).
Elemental analysis for $\mathrm{C}_{12} \mathrm{H}_{30} \mathrm{Pt}_{2} \mathrm{Br}_{4} \mathrm{P}_{2}$ (946.09): Calc C 15.23, H 3.20\%; Found C 15.27, H 3.23\%
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 10.9$ (singlet with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{P} \text {-pt }} 3701 \mathrm{~Hz}$ ) ppm.

### 6.7.14 Synthesis of $\mathbf{c i s}$-[ $\left.\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{ArPBr}_{2}\right)\right]$

$\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)_{2}\right]_{2}(0.45 \mathrm{~g}, 0.48 \mathrm{mmol})$ was added to a dichloromethane solution of $\mathrm{ArPBr}_{2}$ ( $0.46 \mathrm{~g}, 0.97 \mathrm{mmol}$ ). The solution was stirred for one month.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \delta 79.6$ (d with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 5681.8 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 18.3 \mathrm{~Hz}$ ), 15.5 (d with Pt satellites, $\left.{ }^{1} \mathrm{~J}_{\mathrm{Pt-p}} 3221.1 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 18.4 \mathrm{~Hz}\right) \mathrm{ppm} ;{ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \delta-52.9\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}\right.$ $4.5 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), -64.1 ( $\mathrm{s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}$ )

### 6.7.15 Synthesis of trans-[ $\left.\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2}{ }_{2} \mathrm{PBr}\right)\right]$

$$
\mathrm{Ar}_{2}{ }_{2} \mathrm{PBr} \xrightarrow{\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}} \quad\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2}{ }_{2} \mathrm{PBr}\right)\right]
$$

$\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}(0.14 \mathrm{~g}, 0.15 \mathrm{mmol})$ was added to a dichloromethane solution of $\mathrm{Ar}{ }_{2} \mathrm{PBr}$ ( $0.20 \mathrm{~g}, 0.36 \mathrm{mmol}$ ). The solution was stirred overnight.
${ }^{31} \mathrm{P}$ NMR $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \delta 72.0\left(\mathrm{~d}\right.$ with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2516.5 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 562.4 \mathrm{~Hz}$ ), $12.0(\mathrm{~d}$ with Pt satellites, $\left.{ }^{1} \mathrm{~J}_{\mathrm{Pt-P}} 2691.8 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 562.8 \mathrm{~Hz}\right) \mathrm{ppm} ;{ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \delta-54.7(\mathrm{~d}$, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 2.7 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), $-63.9\left(\mathrm{~s}, 6 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 6.7.16 Synthesis of cis-[ $\left.\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]$, trans- $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime \prime} \mathrm{PBr}_{2}\right)\right]$ and $\mathbf{c i s}-\left[\mathbf{P t B r}_{2}\left(\mathbf{P E t}_{3}\right)\left(\mathbf{A r " P B r}_{2}\right)\right]$

trans- $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}+\mathrm{Ar} \mathrm{PBr} / \mathrm{Ar}_{2}{ }_{2} \mathrm{PBr}$<br>$\mathrm{CH}_{2} \mathrm{Cl}_{2}$<br>cis $-\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]+$ trans $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar"PBr}_{2}\right)\right]+$ cis- $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\mathrm{PPBr}} \mathrm{PB}_{2}\right)\right]$

$\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}(0.73 \mathrm{~g}, 078 \mathrm{mmol})$ was added to a dichloromethane solution of $\mathrm{Ar}^{\prime} \mathrm{PBr}_{2} / \mathrm{Ar}^{\prime} \mathrm{PBr}_{2}(0.63 \mathrm{~g}, 1.56 \mathrm{mmol})$. The solution was stirred for three days.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right):$ trans-[ $\left.\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]: \delta 108.6$ (d with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}}$ $2756.7 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{p}} 682.3 \mathrm{~Hz}$ ), 11.9 (d with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2846.5 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 682.6 \mathrm{~Hz}$ ) ppm; cis-[ $\left.\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]: \delta 113.4 \mathrm{ppm}(\mathrm{m}), 13.5$ (d with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 3211.5 \mathrm{~Hz}$, ${ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 11.5 \mathrm{~Hz}$ ); cis-[ $\left.\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{"} \mathrm{PBr}_{2}\right)\right]: \delta 14.1$ (d with Pt satellites, ${ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 3201.7 \mathrm{~Hz}$, $\left.{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 11.6 \mathrm{~Hz}\right) ;{ }^{19} \mathrm{~F}$ NMR $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right):$ trans- $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{3}{ }^{\prime} \mathrm{PBr}_{2}\right): \delta-47.6\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 8.5 \mathrm{~Hz}\right.\right.$, $\left.{ }^{5} \mathrm{~J}_{\mathrm{Pt-F}} 32.5 \mathrm{~Hz}, 3 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-62.7\left(\mathrm{~s}, 3 \mathrm{~F}, p-\mathrm{CF}_{3}\right) \mathrm{ppm} ; \underline{c i s-\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]: \delta-52.8}$ ppm (d with Pt satellites, ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 11.1 \mathrm{~Hz},{ }^{5}{ }_{\mathrm{J} \mathrm{Pt}-\mathrm{F}} 30.3 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ); cis$\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathrm{PBr}_{2}\right)\right]: \delta-50.8 \mathrm{ppm}\left(\mathrm{d}^{4}{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 2.8 \mathrm{~Hz}, 3 \mathrm{~F}, o-\mathrm{CF}_{3}\right),-63.7$ (s, 3F, $\left.p-\mathrm{CF}_{3}\right)$ ppm

### 6.7.17 Attempted synthesis of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{ArAsCl}_{2}\right)\right]$

$$
\mathrm{ArAsCl}_{2} \xrightarrow{\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}}\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{ArAsCl}_{2}\right)\right]
$$

$\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}(0.25 \mathrm{~g}, 0.33 \mathrm{mmol})$ was added to a $\mathrm{ArAsCl}_{2}(0.28 \mathrm{~g}, 0.66 \mathrm{mmol})$ solution in dichloromethane and allowed to stir. No reaction was apparent in the ${ }^{19} \mathrm{~F}$ NMR spectrum, even after extended refluxing over a number of days.

### 6.7.18 Attempted synthesis of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2} \mathrm{AsCl}\right)\right]$

$$
\mathrm{Ar}_{2} \mathrm{AsCl} \xrightarrow{\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}}\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}_{2} \mathrm{AsCl}^{2}\right)\right]
$$

$\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}(0.25 \mathrm{~g}, 0.33 \mathrm{mmol})$ was added to a $\mathrm{Ar}_{2} \mathrm{AsCl}(0.28 \mathrm{~g}, 0.66 \mathrm{mmol})$ solution in dichloromethane and allowed to stir. No reaction was apparent in the ${ }^{19} \mathrm{~F}$ NMR spectrum, even after extended refluxing over a number of days.

### 6.7.19 Attempted synthesis of $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\left(\mathrm{Ar}^{\prime} \mathbf{A r}{ }^{\prime} \mathrm{AsCl}\right)\right]$

$\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}(0.08 \mathrm{~g}, 0.12 \mathrm{mmol})$ was added to a $\mathrm{Ar}_{2} \mathrm{AsCl}(0.13 \mathrm{~g}, 0.23 \mathrm{mmol})$ solution in dichloromethane and allowed to stir. No reaction was apparent in the ${ }^{19} \mathrm{~F}$ NMR spectrum, even after extended refluxing over a number of days.

## Chapter 7

Synthesis of multiple bonded phosphorus compounds

### 7.1 Double bonded compounds between heavier group14 and 15 elements

### 7.1.1 Diphosphenes

The history of diphosphenes started in 1877, when Kohler and Michaelis ${ }^{1}$ first synthesised, by reacting $\mathrm{PhPH}_{2}$ with $\mathrm{PhPCl}_{2}$, what they called "phosphobenzene" by analogy with azobenzene. Some researches continued in this field, but chemists were discouraged by the emergence of the "classical double bond rule". ${ }^{2}$ This rule stipulated that elements possessing a principal quantum number greater than 2 should not be able to form $P_{\pi}-P_{\pi}$ bonds with themselves or other elements. "Phosphobenzene" has since been shown not to be a diphosphene, but a polymer.

However, in 1981, Yoshifuji et al, ${ }^{3}$ reported the synthesis of the first stable diphosphene (by reaction between $\mathrm{Ar}^{*} \mathrm{PCl}_{2}$ and magnesium metal), containing a bulky substituent as a protecting group (2,4,6-tri-butylphenyl $=$ supermesityl ( $\mathrm{Ar}^{*}$ ) )

Subsequently, much research has been carried out in this area and other synthetic routes have been discovered in order to form double bonds between heavier group 14 and 15 elements.

### 7.1.2 Other multiple-bonded main group derivatives

These species are less common than diphosphenes. The first disilene $\mathrm{Mes}_{2} \mathrm{Si}_{1}=\mathrm{SiMes}_{2}$ was obtained by West et al, ${ }^{4}$ and in 1982, Satgé et al ${ }^{5}$ reported the first heteronuclear double bonds in a germanophosphene [ $\mathrm{Me}_{2} \mathrm{Ge}=\mathrm{PPh}$ ] and a stannaphosphene [ $\mathrm{Me}_{2} \mathrm{Sn}=\mathrm{PPh}$ ]. Both phosphaarsenes [e.g. $\left.\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{3} \mathrm{C}-\mathrm{As}=\mathrm{P}-\mathrm{C}\left(\mathrm{SiMe}_{3}\right)_{3}\right]^{6}$ and diarsenes have also been generated, although only a few structures have been published of diarsenes. ${ }^{7-10}$

### 7.1.3 Synthetic routes

There are several synthetic methods to prepare double bond dipnictenes of heavier main groups elements.

- Thermolysis ${ }^{11}$

$$
\mathrm{P}_{2} \mathrm{H}_{4} \longrightarrow \mathrm{P}_{2} \mathrm{H}_{2}+\mathrm{H}_{2}
$$

$\mathrm{P}_{2} \mathrm{H}_{2}$ is not a stable derivative.

- Photochemical elimination ${ }^{4}$

$$
2 \mathrm{Mes}_{2} \mathrm{Si}\left(\mathrm{SiMe}_{3}\right)_{2} \xrightarrow{-\mathrm{Me}_{3} \mathrm{SiSiMe}_{3}} \mathrm{Mes}_{2} \mathrm{Si}=\mathrm{SiMes}_{2}
$$

- Dehalogenation of $\mathrm{R}_{\mathrm{n}} \mathrm{EX}_{2} \mathbf{6 , 1 2 - 1 6}$
$\mathrm{R}_{\mathrm{n}} \mathrm{EX}_{2}$ will react with a halide-abstracting agent such as elemental magnesium, potassium or an alkyllithium.

$$
\begin{gathered}
2 \mathrm{RECl}_{2}+2 \mathrm{Mg}(\mathrm{~K}) \longrightarrow \mathrm{RE}=\mathrm{ER}+2 \mathrm{MgCl}_{2} \quad(\mathrm{E}=\mathrm{P}, \mathrm{As}, \mathrm{Sb}, \mathrm{Bi}) \\
2 \mathrm{R}_{2} \mathrm{GeCl}_{2}+\mathrm{LiNap} \longrightarrow \mathrm{R}_{2} \mathrm{Ge}=\mathrm{GeR}_{2} \\
3\left(\mathrm{Me}_{3} \mathrm{Si}_{3}\right)_{3} \mathrm{C}-\mathrm{PCl}_{2}+3\left(\mathrm{Me}_{3} \mathrm{Si}_{3} \mathrm{C}-\mathrm{AsCl}_{2}\right. \\
\mid \mathrm{BuLi} \\
\\
\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{3} \mathrm{C}-\mathrm{P}=\mathrm{P}-\mathrm{C}\left(\mathrm{SiMe}_{3}\right)_{3}+\left(\mathrm{Me}_{3} \mathrm{Si}_{3}\right)_{3} \mathrm{C}-\mathrm{As}=\mathrm{As}-\mathrm{C}\left(\mathrm{SiMe}_{3}\right)_{3}+\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{3} \mathrm{C}-\mathrm{P}=\mathrm{As}-\mathrm{C}\left(\mathrm{SiMe}_{3}\right)_{3}
\end{gathered}
$$

- Dehydrohalogenation of $\mathrm{R}_{\mathrm{n}}$ EX-HER', ${ }_{\mathrm{m}}{ }^{17-20}$

This is a widely used method to synthesise symmetrical and unsymmetrical compounds. It consists of reacting $\mathrm{R}_{\mathrm{n}} \mathrm{EX}_{2}$ and $\mathrm{R}_{\mathrm{m}} \mathrm{EH}_{2}$ in the presence of a base.

$$
\begin{aligned}
& \mathrm{ArPCl}_{2}+\mathrm{ArPH}_{2}+2 \mathrm{DBU} \xrightarrow{-2 \mathrm{DBU} . \mathrm{HCl}} \quad \mathrm{ArP}=\mathrm{PAr} \\
& \mathrm{RPCl}_{2}+\mathrm{R}^{\prime} \mathrm{PH}_{2}+2 \mathrm{DBU} \xrightarrow{-2 \text { DBU. } \mathrm{HCl}} \quad \mathrm{RP}=\mathrm{PR}^{\prime} \\
& \mathrm{ArPH}_{2}+\mathrm{Mes}(\mathrm{Bu}) \mathrm{GeCl}_{2}+\mathrm{BuLi} \longrightarrow \mathrm{Mes}(\mathrm{Bu}) \mathrm{Ge}=\mathrm{PAr} \\
& \mathrm{RPH}_{\mathbf{2}}+\mathrm{R}^{\prime} \mathrm{R}^{\prime \prime} \mathrm{SiCl}_{2}+\mathrm{BuLi} \longrightarrow \quad \mathrm{RP}=\mathrm{SiR}^{\prime} \mathrm{R}^{\prime \prime}
\end{aligned}
$$

This reaction has proved to be the most useful for the formation of symmetrical double bonds between main group 14 and 15 elements, and has occasionally been used to prepare unsymmetrical double bond compounds.

- Transition metal "catalysed" metathesis of double bonds 21,22

$$
\mathrm{RPCl}_{2}+\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6} \longrightarrow \quad \mathrm{RP}=\mathrm{PR}
$$

Dillon et al ${ }^{21}$ used the highly reducing nature and labile coordination sphere of the zerovalent tungsten complex, $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$, as an efficient chloride ion abstractor. Dichlorophosphanes react with $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ in benzene smoothly over several hours to give the diphosphene $R P=P R\left[R: 2,4,6\right.$-tris- ${ }^{\text {tbutylphenyl, }}$ 2,4,6-tris(trifluoromethyl)phenyl, 2,6-bis(trifluoromethyl)phenyl]. The proposed mechanism is shown below (Figure 7.1).

Equation 7.1: Mechanism of the formation of diphosphenes with $W\left(\mathrm{PMe}_{3}\right)_{6}$

The key intermediate that is proposed in this mechanism is the tungsten phosphinidene complex. Although a few have been characterised, double bond transition metal phosphinidene complexes are relatively rare. 23-26
Surprisingly, when different starting materials $\mathrm{ArPCl}_{2}$ and $\mathrm{Ar}^{*} \mathrm{PCl}_{2}$ reacted with $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$, only the unsymmetrical diphosphene $\mathrm{ArP}=\mathrm{PAr}^{*}$ was produced in a good yield. During the reaction, it was seen that the symmetrical diphosphene ArP=PAr was formed first, but was then converted to the unsymmetrical diphosphene $\mathrm{ArP}=\mathrm{PAr}^{*}$. However, upon removal of the reaction solvent, the symmetrical diphosphenes were precipitated with the unsymmetrical signal almost lost from the ${ }^{31} \mathrm{P}$ NMR spectrum, as shown in Figure 7.1 below:

Fiqure 7.1: (a) ${ }^{31} P$ NMR spectrum of $R^{\prime} P=P R^{2}$, generated upon treatment of a 1:1 mixture of $R^{\prime} P C l_{2}$ and $R^{2} P C l_{2}$ with $W\left(P M e_{3}\right)_{6}$ in benzene (* and $\Delta$ indicate resonances due to the symmetrical diphosphenes, $R^{\prime} P=P R^{\prime}$ and $R^{2} P=P R^{2}$, respectively. (b) ${ }^{31} P N M R$ spectrum of the precipitated solids. ${ }^{21}$

The result indicates that the presence of a particular species in solution is capable of rapidly catalysing the exchange of the diphosphene PR end-groups. This exchange does not occur in the absence of the tungsten species, since on addition of a $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6} / \mathrm{ArPCl}_{2}$ mixture to the symmetrical diphosphenes $\mathrm{ArP}=\mathrm{PAr}$ and $\mathrm{Ar}^{*} \mathrm{P}=\mathrm{PAr}^{*}$, they changed into the unsymmetrical diphosphene $\mathrm{ArP}=\mathrm{PAr}^{*}$. The possible mechanism for this reaction could be PR end-group exchange that involves a phosphinidene intermediate.

Figure 7.2: Metathesis mechanism

To isolate the unsymmetrical compound, it is first necessary to destroy the catalyst. The most convenient method is to treat the solution with benzaldehyde, a procedure analogous to that used to destroy well-defined alkylidene olefin metathesis catalysts. This is the only route so far using different dichlorophosphanes to prepare unsymmetrical diphosphenes.

### 7.1.4 Synthetic routes and Chemical shifts of $\mathbf{R P}=$ ER' $^{\prime}$ systems

- Phosphasilenes

Many synthetic routes have been found to synthesise $\mathbf{S i}=\mathbf{P}$ derivatives:

- dechlorination of a chlorophosphane by alkyllithium ${ }^{27,28}$
- dehydrofluorination of a fluorosilylphosphane by an alkylithium 27,28
- reaction of water or an alkyl halide with a diphosphasilaallylanion 29
- addition of two equivalents of butyllithium to a mixture of primary phosphane and dichlorosilane ${ }^{28}$

Equation 7.2: Synthetic routes to phosphasilenes

## - Germaphosphenes

Germaphosphenes species can be prepared as follows:

- dehydrofluorination of a fluorogermylphosphane by tert-butyllithium ${ }^{30-36}$
- dehydrochlorination of a chlorogermylphosphane by a phosphorus ylide or DBU ${ }^{30-36}$
- reaction of a difluorogermane with a dilithium phosphanide ${ }^{34,35}$

Equation 7.3: Synthetic routes to germaphosphenes

- Stannaphosphenes

There are two different routes to prepare stannaphosphenes:

- dehydrofluorination of a fluorostannylphosphane by tertbutyllithium ${ }^{32,35-37}$
- defluorosilylation of a fluorostannyl(silyl)phosphane ${ }^{32,35-37}$

Equation 7.4: Synthetic routes to stannaphosphenes
${ }^{31} \mathrm{P}$ chemicals shifts of selected $\mathrm{M}=\mathrm{P}$ compounds are listed in Table 7.1:

Table 7.1: $\delta^{31} P,{ }^{29}$ Si and ${ }^{119}$ Sn for metallaphosphenes

### 7.2 Disphosphenes and related species

The reactions were carried out following the method described above, using the tungsten compound $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ as a chlorine abstractor. ${ }^{21}$ Because of a very small amount of the catalyst being available, reactions have been attempted on an NMR scale or a very small scale.

### 7.2.1 Reaction of $\mathrm{ArPCl}_{\mathbf{2}}$ with $\mathbf{W}\left(\mathrm{PMe}_{3}\right)_{6}$

Equation 7.5: Synthesis of ArP $=P A r$

Two equivalents of $\mathrm{ArPCl}_{2}$ were added to a solution of $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ in benzene- $\mathrm{d}_{6}$ at room temperature. The reaction immediately turned from yellow to red. The mechanism of the formation of the diphosphene is shown in Equation 7.1. The ${ }^{31} \mathrm{P}$ NMR spectrum showed a multiplet ( 13 lines, ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 22.7 \mathrm{~Hz}$ ) at 473 ppm , corresponding to ArP=PAr. A signal assigned to the $\mathrm{W}(\mathrm{IV})$ by-product $\mathrm{WCl}_{4}\left(\mathrm{PMe}_{3}\right)_{3}$ was found at 32.2 ppm and a singlet at -61.1 ppm indicated the presence of free $\mathrm{PMe}_{3}$.
The characteristic ${ }^{31} \mathrm{P}$ chemical shift of the diphosphene is due to an increase in the paramagnetic shielding term caused by the existence of low-lying excited states. The ${ }^{19} \mathrm{~F}$ NMR spectrum displayed a triplet at $-55.9 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 22.7 \mathrm{~Hz}\right)$ and a singlet at -63.1 ppm . This triplet has been observed in similar systems, for example Ar'P=PAr'. 38

### 7.2.2 Reaction of $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2} / \mathrm{Ar}^{\prime} \mathbf{P C l}_{\mathbf{2}}$ with $\mathbf{W}\left(\mathrm{PMe}_{3}\right)_{6}$

## Equation 7.6: Attempted synthesis of $A r^{\prime} P=P A r^{\prime}$

Two equivalents of the mixture $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{PCl}_{2}$ were added to a solution of $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ in benzene- $\mathrm{d}_{6}$ at room temperature. After stirring overnight, the solution turned red. The ${ }^{31} \mathrm{P}$ NMR spectrum exhibited a multiplet at 479.8 ppm ( ${ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 45.2 \mathrm{~Hz}$ ). This confirms the formation of the symmetrical diphosphene. ${ }^{38}$ The quartet corresponding to $\mathrm{Ar}{ }^{\prime} \mathrm{PCl}_{2}$ was still visible in the spectrum. The ${ }^{31} \mathrm{P}$ NMR spectrum run after a week showed the appearance of a small multiplet at 506.0 ppm (the coupling constant could however not be determined for this signal). This signal could arise from the symmetrical species Ar" $=$ =PAr".

### 7.2.3 Reaction between $\mathrm{ArPCl}_{2}, \mathrm{ArAsCl}_{2}$ and $\mathbf{W}\left(\mathrm{PMe}_{3}\right)_{6}$

Equation 7.7: Attempted synthesis of $\operatorname{ArP}=$ AsAr
$\mathrm{ArPCl}_{2}$ and $\mathrm{ArAsCl}_{2}$ were added to a $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ solution in benzene-d $\mathrm{d}_{6}$ at room temperature. The solution was stirred overnight and a red coloration appeared. Only the signal corresponding to $\mathrm{ArP}=\mathrm{PAr}$ at 473.9 ppm was observed in the ${ }^{31} \mathrm{P}$ NMR. No apparent signal of ArAs=PAr has been detected. However, no signal of the starting material $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ remained in the spectrum.

### 7.2.4 Reaction between $\mathrm{ArPCl}_{2}, \mathrm{Ar}_{2} \mathbf{G e C l}_{2}$ and $\mathbf{W}\left(\mathrm{PMe}_{3}\right)_{6}$

Equation 7.8:Attempted synthesis of $A r P=G e A r$
$\mathrm{ArPCl}_{2}$ and $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$ were added to a $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ solution in benzene- $\mathrm{d}_{6}$ at room temperature. A red coloration appeared immediately. Only the signal corresponding to $\mathrm{ArP}=\mathrm{PAr}$ at 473.9 ppm was observed in the ${ }^{31} \mathrm{P}$ NMR. No apparent signal of $\mathrm{Ar}_{2} \mathrm{Ge}=\mathrm{PAr}$ has been detected. The ${ }^{19} \mathrm{~F}$ NMR spectrum only showed the presence of $\mathrm{ArP}=\mathrm{PAr}$ and the starting material $\mathrm{Ar}_{2} \mathrm{GeCl}_{2}$

### 7.2.5 Reaction between $\mathrm{ArPCl}_{2}, \mathbf{A r}_{\mathbf{2}} \mathbf{S n C l}_{\mathbf{2}}$ and $\mathbf{W}\left(\mathrm{PMe}_{3}\right)_{6}$

$\mathrm{ArPCl}_{2}$ and $\mathrm{Ar}_{2} \mathrm{SnCl}_{2}$ were added to a $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ solution in benzene- $\mathrm{d}_{6}$ at room temperature. The reaction was stirred for three days. The only signal visible in the ${ }^{31} \mathrm{P}$ NMR spectrum was the one corresponding to $\mathrm{ArP}=\mathrm{PAr}$.

### 7.2.6 Conclusion

As previously described in the literature, $\mathrm{ArP}=\mathrm{PAr}$ and $\mathrm{Ar} \mathbf{P}=\mathrm{PAr}$ ' were prepared. The attempt at making some $\operatorname{ArP}=\mathrm{EAr}(\mathrm{E}=\mathrm{As})$ or $\mathrm{ArP}=\mathrm{EAr}_{2}(\mathrm{E}=\mathrm{Ge}$ or Sn$)$ does not seem to have been successful. The $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ catalyst might not be able to withdraw the chlorine atom from those elements.

However, all the reactions have been done on an NMR scale using very small quantities, which were not always very accurate. It would be interesting to scale up some of these, in order to check and confirm these results. In case the tungsten catalyst reacts very slowly to remove the chlorine atoms from arsenic, reacting two equivalents of $\mathrm{ArAsCl}_{2}$ with $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ would be the next step. The study could not be done due to the unavailability of ${ }^{19} \mathrm{~F}$ NMR spectroscopy at the time, and lack of more $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ catalyst.

### 7.3 Phosphaalkenes and Phosphaalkynes

### 7.3.1 Phosphaalkenes

The chemistry of phosphaalkenes has only been developed in the last 25 years. In 1960, Dimroth and Hoffman first reported the synthesis of compounds containing a $\mathrm{P}=\mathrm{C}$ double bond. ${ }^{41,42}$ In 1976, the first stable acyclic species was described. ${ }^{43}$ However, these compounds were only stable in the absence of air and moisture. Kinetic stabilisation using bulky substituents on phosphorus has facilitated the development of several synthetic routes to prepare stable phosphaalkenes. ${ }^{44}$
The first phosphaalkene containing the Ar ligand, $\operatorname{ArP}=\mathrm{CR}^{1} \mathrm{R}^{2}\left(\mathrm{R}^{1}=\mathrm{R}^{2}=\mathrm{Cl} ; \mathrm{R}^{1}=\mathrm{SiMe}_{3}\right.$, $\left.\mathrm{R}^{2}=\mathrm{H} ; \mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{2}=\mathrm{H}\right)$, were reported by Dillon and Goodwin. ${ }^{17,45}$ The method used for the first of these syntheses consists of two reactions:

The coordination chemistry of these compounds with platinum has also been studied ${ }^{45}$ and indicated the formation of $\eta^{1}$-bonded complexes.

### 7.3.2 Phosphaalkynes

The first phosphaalkyne HCP was synthesised in 1961 by Gier 46 but appeared to be very unstable. Twenty years later, the first stable phosphaalkyne, BuCP was prepared. 47 Since, a variety of stable phosphaalkynes has been synthesised.
The inorganic and organic chemistry of phosphaalkynes has been extensively developed in the recent years and numerous routes to prepare phosphaalkynes have been found. 44 Among them, the synthesis of RCP (where $\mathrm{R}=$ Supermes), by the reaction of the phosphaalkene $\mathrm{RP}=\mathrm{CCl}_{2}$ with $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$, was described by Sanchez et al, ${ }^{48}$ with a mechanism involving the rearrangement of the intermediate species $[\mathrm{RP}=\mathrm{C}$ :]

Equation 7.10: Proposed mechanism for the synthesis of a phosphaalkyne using Pd $L_{4}$ and $\mathrm{RP}=\mathrm{CCl}_{2}$

This reaction is identical to the one published by Angelici et al ${ }^{49}$ in which some crystal structures of the intermediates are shown. They described the formation of a fourmembered ring between a $\mathrm{C}=\mathrm{C}$ bond in the aryl ring and the $\mathrm{P}=\mathrm{C}$ phosphaalkene bond (Equation 7.11).

The chemistry of phosphaalkynes is quite diverse and work has mainly been done with aryl and alkyl substituents on C . The alkyl group used, such as ${ }^{\mathrm{t}} \mathrm{Bu}$, tend to be electrondonating ligands, and increase the electron density at the $\mathrm{C} \equiv \mathrm{P}$ triple bond. So far, no phosphaalkyne containing fluoromes or fluoroxyl substituents has been reported. However, some attempts have been made by Goodwin ${ }^{17}$ and Roden ${ }^{50}$ but have not been successful. Using "Angelici's method", Roden found that $\mathrm{ArP}=\mathrm{CCl}_{2}$ reacts with $\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{4}$ to form a stable complex trans- $\left[\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}\left(\mathrm{C}(\mathrm{Cl})=\mathrm{PAr}{ }^{\prime}\right)\right]$ which has been structurally characterised. ${ }^{50}$

Equation 7.11: Mechanism demonstrated by Angelici et al49

### 7.3.3 Preparation of Phosphaalkenes

### 7.3.3.1 Synthesis of $\mathrm{ArP}(\mathrm{Cl}) \mathrm{CHCl}_{2}$

This compound was synthesised by reaction of $\mathrm{ArPCl}_{2}$ with a solution of lithiated $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{CHCl}_{2} \mathrm{Li}$, at $-130^{\circ} \mathrm{C}$. $\mathrm{ArP}=\mathrm{CCl}_{2}$ was purified by distillation, yielding a colourless oil.

Equation 7.12: Synthesis of $\mathrm{ArP}(\mathrm{Cl}) \mathrm{CHCl}_{2}$

The ${ }^{31} \mathrm{P}$ NMR spectrum showed a septet at $63.1 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\text {p.F }} 49.3 \mathrm{~Hz}\right.$ ). The ${ }^{19}$ F NMR spectrum displayed a doublet at $-55.3 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\text {P-F }} 49.3 \mathrm{~Hz}\right.$ ) corresponding to the $o-\mathrm{CF}_{3}$ groups, and a singlet at $-64.5 \mathrm{ppm}\left(p-\mathrm{CF}_{3}\right)$. These values agree with those found by Goodwin and Roden. 17,50

### 7.3.3.2 Synthesis of $\mathrm{ArP}=\mathrm{CCl}_{2}$

## Equation 7.13: Synthesis of $\mathrm{ArP}=\mathrm{CCl}_{2}$

This phosphaalkene was prepared by addition of DBU to an $\mathrm{ArP}(\mathrm{Cl}) \mathrm{CHCl}_{2}$ solution in THF at $-78^{\circ} \mathrm{C}$. The product was purified by distillation, giving a colourless oil. A septet at 202.4 ppm was observed in the ${ }^{31} \mathrm{P}$ NMR spectrum ( ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 20.6 \mathrm{~Hz}$ ). The ${ }^{19} \mathrm{~F}$ NMR spectrum exhibited a doublet at $-60.0 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\text {P-F }} 21 \mathrm{~Hz}, o-\mathrm{CF}_{3}\right)$ and a singlet at $-63.9 \mathrm{ppm}\left(p-\mathrm{CF}_{3}\right)$.

Figure 7.3: ${ }^{31} \mathrm{P}$ NMR spectrum of $\mathrm{ArP}=\mathrm{CCl}_{2}$

Figure 7.4: ${ }^{19} \mathrm{~F}$ NMR spectrum of $\mathrm{ArP}=\mathrm{CCl}_{2}$
7.3.3.3 Synthesis of $\mathrm{Ar}^{\prime} \mathrm{P}(\mathrm{Cl}) \mathrm{CHCl}_{2}$

Equation 7.14: Synthesis of $\mathrm{Ar}^{\prime} \mathrm{P}(\mathrm{Cl}) \mathrm{CHCl}_{2}$

This product was prepared following the same synthesis as described above for the preparation of $\mathrm{ArP}(\mathrm{Cl}) \mathrm{CHCl}_{2}$. The mixture $\mathrm{Ar} \mathrm{Li} / \mathrm{Ar}{ }^{\prime} \mathrm{Li}$ was reacted with a solution of
lithiated $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $-130^{\circ} \mathrm{C}$. This compound was purified by distillation under reduced pressure.
The ${ }^{31} \mathrm{P}$ NMR spectrum showed a septet at $65.3 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 48.8 \mathrm{~Hz}\right)$. A doublet at -53.9 ppm ( ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 48.9 \mathrm{~Hz}$ ) was observed in the ${ }^{19} \mathrm{~F}$ NMR spectrum.

As observed by Roden, $\mathrm{Ar}{ }^{\prime} \mathrm{PCl}_{2}$ does not form the product $\mathrm{Ar}{ }^{\prime} \mathrm{P}(\mathrm{Cl}) \mathrm{CHCl}_{2}$. The signals from the starting material $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ are still visible in both ${ }^{31} \mathrm{P}$ and ${ }^{19} \mathrm{~F}$ NMR spectra.

### 7.3.3.4 Synthesis of $\mathrm{Ar}{ }^{\prime} \mathrm{P}=\mathrm{CCl}_{2}$

Equation 7.15: Synthesis of $\mathrm{Ar}^{\prime} \mathrm{P}=\mathrm{CCl}_{2}$

NMR spectroscopy showed a septet at $207.6 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\text {P. }} 20.7 \mathrm{~Hz}\right.$ ) in the ${ }^{31} \mathrm{P}$ spectrum and a doublet at $-59.6 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P} \cdot \mathrm{F}} 21.1 \mathrm{~Hz}\right)$ in the ${ }^{19} \mathrm{~F}$ spectrum.

These results are similar to those found by Roden. 50

Comparison of the chemical shifts between the starting material $\mathrm{ArPCl}_{2}$ or $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ and the final products $\mathrm{ArP}=\mathrm{CCl}_{2}$ and $\mathrm{Ar} \mathrm{P}=\mathrm{CCl}_{2}$ shows that $\delta{ }^{19} \mathrm{~F}$ values are at lower frequency for the phosphaalkenes than for the phosphanes, and that $\delta^{31} \mathrm{P}$ moves to a higher frequency. This implies more shielding and electron density on the $\mathrm{CF}_{3}$ groups. The electron-withdrawing effect is facilitated by the formation of the $\mathrm{P}=\mathrm{C}$ double bond.

The P-F coupling constant is significantly smaller in the phosphaalkene than in the phosphane. The formation of the $\mathrm{P}=\mathrm{C}$ bond decreases the p character of the phosphorus hybrid orbitals. The phosphorus becomes more positive and the chemical shifts move to higher frequency. In the meantime, the electron density in the $\mathrm{CF}_{3}$ groups increases, moving the fluorine shifts to a lower frequency (Table 7.2).

|  | $\delta^{31} \mathrm{P}$ | $\delta^{19} \mathrm{~F}$ |  | ${ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}$ |
| :---: | :---: | :---: | :---: | :---: |
|  |  | $o-\mathrm{CF}_{3}$ | -53.3 | -64.2 |
| $\mathrm{ArPCl} \mathrm{Cl}_{3}$ | 61.3 |  |  |  |
| $\mathrm{ArP}(\mathrm{Cl}) \mathrm{CHCl}_{2}$ | 145.6 | -55.3 | -64.5 | 49.3 |
| $\mathrm{ArP}=\mathrm{CCl}_{2}$ | 202.1 | -60.0 | -63.9 | 20.6 |
| $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2}$ | 148.4 | -53.2 |  | 61.3 |
| $\mathrm{Ar}{ }^{\prime} \mathrm{P}(\mathrm{Cl}) \mathrm{CHCl}_{2}$ | 65.3 | -53.9 | 48.8 |  |
| $\mathrm{Ar}{ }^{\prime} \mathrm{P}=\mathrm{CCl}_{2}$ | 207.6 | -59.6 | 21 |  |

Table 7.2: Comparison of $\delta^{31} P$ and ${ }^{19} F$ between phosphanes and phosphaalkenes

### 7.4 Attempted preparation of phosphaalkynes

According to Angelici's report, ${ }^{49}$ reaction of phosphaalkenes with $\operatorname{Pt}(0)$ or $\operatorname{Pd}(0)$ compounds leads to an intermediate Pt or Pd complex, which undergoes rearrangement to give a phosphaalkyne.

### 7.4.1 Reaction between $\mathbf{A r P}=\mathbf{C C l}_{\mathbf{2}}$ and $\mathbf{P t}\left(\mathbf{P P h}_{3}\right)_{4}$

- NMR spectroscopy
$\mathrm{ArP}=\mathrm{CCl}_{2}$ was added to a solution of $\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{4}$ in toluene at room temperature.
The ${ }^{31} \mathrm{P}$ NMR spectrum exhibited two multiplets with Pt satellites at $203.7\left({ }^{2} \mathrm{~J}_{\mathrm{PL}-\mathrm{P}} 282.6\right.$ $\mathrm{Hz},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 22.6 \mathrm{~Hz}$ ) and $198.1\left({ }^{2} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 369.2 \mathrm{~Hz},{ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 45.4 \mathrm{~Hz},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 22.6 \mathrm{~Hz}\right.$ ) ppm, assigned
to the phosphaalkene ligand. Three different signals were assignable to $\mathrm{PPh}_{3}$ bonded to platinum: a doublet at $24.6\left({ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 27.5 \mathrm{~Hz},{ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 2963.5 \mathrm{~Hz}\right)$, a doublet of doublets at 17.3 $\left({ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 48.4 \mathrm{~Hz},{ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 17.8 \mathrm{~Hz},{ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 1897.2\right)$ and a pseudo triplet at $14.1 \mathrm{ppm}\left({ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}{ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}\right.$ $15.3 \mathrm{~Hz},{ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 4063.8 \mathrm{~Hz}$ ). A signal for the free $\mathrm{PPh}_{3}$ was also observed at -6 ppm . The multiplets in the phosphaalkene region should, in fact, be a doublet of doublets of septets for the cis-isomer, due to the coupling with the fluorines of the two o-CF ${ }_{3}$ groups (7 lines) and the phosphorus from the $\mathrm{PPh}_{3}$, groups and a triplet of septets for the transisomer. The signal at 198.1 ppm has a greater intensity than the one at 203.7 ppm . The resonance at 14.1 ppm appeared as a triplet but should be a doublet of doublets. The ${ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}$ and ${ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{P}}$ coupling constants are very similar and could not be distinguished. These results indicate the presence of two complexes in solution.
The ${ }^{19}$ F NMR spectrum exhibited two close doublets at $-57.8\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 23.7 \mathrm{~Hz}\right)$ and -57.9 $\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 23.0 \mathrm{~Hz}\right) \mathrm{ppm}$, and two singlets at -62.9 and -63.0 ppm .
${ }^{19} \mathrm{~F}$ NMR spectroscopy also indicated the presence of two different species in solution. Neither of these corresponds to the starting material, and comfirms that two new complexes have been prepared, ascribed to cis- and trans-isomers. In the case of the trans isomer, the two $\mathrm{PPh}_{3}$ groups are equivalent, and should only give a doublet in the ${ }^{31} \mathrm{P}$ NMR spectrum. The cis complex should give two different doublets of doublets for the $\mathrm{PPh}_{3}$ groups with a cis and a trans coupling. Resonances in the ${ }^{19} \mathrm{~F}$ NMR spectrum were assigned according to their relative intensities when compared with the ${ }^{31} \mathrm{P}$ NMR spectrum. Suggested assignments are listed in Table 7.3.

trans-isomer

cis-isomer

Table 7.3: Assignments for cis and trans isomers

The solution containing those two isomers was stirred in dichloromethane in order to try and obtain a phosphaalkyne. No changes were observed in the ${ }^{31} \mathrm{P}$ NMR spectrum.

- X-ray crystallography

After standing for two month, orange crystals formed. They were submitted for X-ray analysis. The structure was determined by A.L. Thompson at 120 K and is shown in Figure 7.6.

Trans- $\left[\mathrm{PtCl}(\mathrm{CCl}=\mathrm{PAr})\left(\mathrm{PPh}_{3}\right)_{2}\right]$ crystallises in the triclinic $\mathrm{P}-1$ space group with $\mathrm{Z}=2$. Selected bond angles $\left({ }^{\circ}\right)$ and distances $(\AA)$ are listed in Table 7.4. They are similar to those found in trans- $\left[\mathrm{PtCl}(\mathrm{CCl}=\mathrm{PAr})\left(\mathrm{PPh}_{3}\right)_{2}\right] .50$

Figure 7.6: Molecular structure of trans-[ $\left.\mathrm{PtCl}(\mathrm{CCl}=\mathrm{PAr})\left(\mathrm{PPh}_{3}\right)_{2}\right]$

| Bond distances $(\AA)$ |  | Angles $\left({ }^{\circ}\right)$ |  |
| :---: | :---: | :---: | :---: |
| $\mathrm{Pt}(1)-\mathrm{C}(10)$ | $2.0143(4)$ | $\mathrm{C}(10)-\mathrm{Pt}(1)-\mathrm{P}(3)$ | $92.43(5)$ |
| $\mathrm{Pt}(1)-\mathrm{P}(3)$ | $2.3205(4)$ | $\mathrm{C}(10)-\mathrm{Pt}(1)-\mathrm{P}(2)$ | $93.93(50$ |
| $\mathrm{Pt}(1)-\mathrm{P}(2)$ | $2.3284(4)$ | $\mathrm{P}(3)-\mathrm{Pt}(1)-\mathrm{P}(2)$ | $173.693(16)$ |
| $\mathrm{Pt}(1)-\mathrm{Cl}(1)$ | $2.3629(5)$ | $\mathrm{C}(10)-\mathrm{Pt}(1)-\mathrm{Cl}(1)$ | $173.63(5)$ |

| $\mathrm{Cl}(11)-\mathrm{C}(10)$ | $1.7653(19)$ | $\mathrm{C}(10)-\mathrm{P}(1)-\mathrm{C}(11)$ | $123.021(11)$ |

Table 7.4: Selected bond angles $\left(^{\circ}\right)$ and distances $(\AA)$

The platinum is in a square planar environment which is defined by the two $\mathrm{PPh}_{3}$ (trans to each other), Cl , and $[\mathrm{C}(=\mathrm{PAr}) \mathrm{Cl}]$ ligands. The atoms $\mathrm{Pt}, \mathrm{P}(2), \mathrm{P}(3), \mathrm{Cl}(1)$ and $\mathrm{C}(10)$ are
nearly coplanar. The $\mathrm{C}(10)-\mathrm{P}(1)$ distance $(1.6882(19) \AA)$ is very similar to that of a $\mathrm{C}=\mathrm{P}$ bond, as found in $\left.\left[\mathrm{Pt}\left(\mathrm{PEt}_{3}\right)_{2} \mathrm{C}(\mathrm{Cl})=\mathrm{PMes}{ }^{*}\right) \mathrm{Cl}\right]^{49}$ (1.678(5) $\AA$ )and $\mathrm{Ph}\left(\mathrm{Me}_{3} \mathrm{Si}\right) \mathrm{C}=\mathrm{P}-\mathrm{Mes}^{*}$ $(1.676(6) \AA) .{ }^{51}$ Three short contacts between some fluorines of the $o-\mathrm{CF}_{3}$ groups and the phosphorus atom are found: $\mathrm{P}(1)--\mathrm{F}(12) 3.039, \mathrm{P}(1)--\mathrm{F}(13) 3.160, \mathrm{P}(1)--\mathrm{F}(18) 2.911 \AA$. They are all shorter than the expected sum of the van der Waals radii for $P(1.91 \AA)$ and $\mathrm{F}(1.40 \AA$ ).

### 7.4.2 Reaction between $\mathbf{A r} \mathbf{P}=\mathbf{C C l}_{2}$ and $\mathbf{P t}\left(\mathbf{P P h}_{3}\right)_{4}$

$\mathrm{Ar} \mathrm{P}=\mathrm{CCl}_{2}$ was added to a $\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{4}$ solution in benzene and the resulting yellow solution stirred. The initial ${ }^{31} \mathrm{P}$ NMR showed a multiplet with platinum satellites at 202.4 $\left({ }^{2} \mathrm{~J}_{\text {Pt-P }} 376.5 \mathrm{~Hz},{ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 46.1 \mathrm{~Hz},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 24.4 \mathrm{~Hz}\right.$ ), a doublet of doublets with Pt satellites at $17.1\left({ }^{1} \mathrm{~J}_{\text {Pt-P }} 1954.1 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\text {P-P }} 16.7 \mathrm{~Hz},{ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 47.1 \mathrm{~Hz}\right)$ and a pseudo triplet at $13.5 \mathrm{ppm}\left({ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}}\right.$ $3936.1 \mathrm{~Hz},{ }^{2} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} /{ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 18.7 \mathrm{~Hz}$ ). A doublet at $-57.8 \mathrm{ppm}\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 21.1 \mathrm{~Hz}\right)$ was observed in the ${ }^{19}$ F NMR spectrum. These resonances indicate the formation of the cis-complex.
Half of the solvent was removed from the solution, and a white solid was isolated which displayed a resonance at $15.3 \mathrm{ppm}\left({ }^{1} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 3272.6 \mathrm{~Hz}\right.$ ) in the ${ }^{31} \mathrm{P}$ NMR spectrum. This compound is cis-[ $\left.\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}\right] .49$ The solid was filtered off and spectra of the filtrate were recorded regularly to see any change occurring. After two weeks, new peaks appeared in the ${ }^{31} \mathrm{P}$ and ${ }^{19} \mathrm{~F}$ NMR spectra. In addition to the signals described above, a multiplet at $208.3 \mathrm{ppm}\left({ }^{2} \mathrm{~J}_{\mathrm{Pt}-\mathrm{P}} 456.7 \mathrm{~Hz}\right)$, and a doublet with Pt satellites at $24.3 \mathrm{ppm}\left({ }^{1} \mathrm{~J}_{\mathrm{Pt}}\right.$ ${ }_{\mathrm{P}} 2989.9 \mathrm{~Hz},{ }^{3} \mathrm{~J}_{\mathrm{P}-\mathrm{P}} 27.5 \mathrm{~Hz}$ ) were found. Cis- and trans-isomers were present in solution. The ${ }^{19}$ F NMR exhibited two sets of doublets at $-57.6\left({ }^{4} \mathrm{~J}_{\text {P-F }} 23.9 \mathrm{~Hz}\right)$ and $-57.8\left({ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 21.1\right.$ $\mathrm{Hz}) \mathrm{ppm}$. Assignments of these signals were made according to the relative intensities of the peaks, in comparison with the resonances in the ${ }^{31} \mathrm{P}$ NMR.

trans-isomer

${ }^{a}$ all coupling constants are given in Hz

Table 7.5: Assignments for cis and trans isomers

Solvent was removed under vacuum, leaving a yellow/brown oil which was dissolved in toluene.
The ${ }^{31} \mathrm{P}$ NMR did not show the presence of the cis and trans isomers, but new signals of small intensity were observed in the spectrum: a multiplet at 131.5 and a peak at 26.3 ppm. No platinum satellites were found, probably due to the low intensity of the signals.

The ${ }^{19}$ F NMR spectrum displayed a doublet at $-58.6\left({ }^{4}{ }^{3}\right.$ P-F 8.1 Hz$)$ and a singlet at -63.2 ppm. These could be assigned to an intermediate parallel to the one described by Angelici ${ }^{49}$ (Figure 7.8).

Figure 7.8: Possible intermediate in the reaction

Spectra of this intermediate were monitored after a month to see if any rearrangement to phosphaalkyne had occurred. A number of new peaks appeared in the spectra but none of them could be assigned. This could be due to degradation of the compound in the NMR tube.

No apparent signal corresponding to the phosphaalkyne has been found, but the presence of an intermediate species has been proved.

### 7.5 Experimental

### 7.5.1 Introduction

All manipulations, including NMR sample preparation, were carried out either under an inert atmosphere of dry nitrogen or in vacuo, using standard Schlenk procedures or a glovebox. Chemicals of the best available commercial grades were used, in general without further purification. We thank Johnson Matthey for the loan of platinum salts.

- NMR spectroscopy
- diphosphenes and related species
${ }^{31} \mathrm{P}$ NMR spectra were recorded on a Bruker 300 spectrometer at 121.5 MHz .
- phosphaalkenes
${ }^{19}$ F NMR spectra were recorded on a Varian Mercury 200 or Varian VXR 400 Fouriertransform spectrometer at 188.18 and 376.35 MHz respectively. ${ }^{31} \mathrm{P}$ NMR spectra were recorded on the same instruments at 80.96 or 161.91 MHz . Chemical shifts were measured relative to external $\mathrm{CFCl}_{3}\left({ }^{19} \mathrm{~F}\right)$. or $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}\left({ }^{31} \mathrm{P}\right)$, with the higher frequency direction taken as positive.
- W(PMe $\left.3_{3}\right)_{6}$ was prepared by J. Grundy and Dr M. P. Coles at the University of Sussex. All manipulations with this catalyst were carried out at the University of Sussex.

### 7.5.2 Synthesis of ArP=PAr

$$
2 \mathrm{ArPCl}_{2}+\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6} \xrightarrow{\mathrm{C}_{6} \mathrm{D}_{6}} \quad \mathrm{ArP}=\mathrm{PAr}
$$

$\operatorname{ArPCl}_{2}(0.1 \mathrm{~g}, 0.45 \mathrm{mmol})$ and $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}(0.1 \mathrm{~g}, 0,21 \mathrm{mmol})$ were placed in an NMR tube and dissolved in $\mathrm{C}_{6} \mathrm{D}_{6}$. The solution changed colour from yellow to red. The resulting solution was stirred for 18 hours.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 473.0\left(\mathrm{~m},{ }^{1} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 22.7 \mathrm{~Hz}\right) \mathrm{ppm},{ }^{19} \mathbf{F}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-55.9\left(\mathrm{t},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 22.7\right.$ $\mathrm{Hz}, 12 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), -63.1 (s, 6F, $p-\mathrm{CF}_{3}$ ) ppm.

### 7.5.3 Synthesis of Ar'P=PAr'

$\mathrm{Ar}{ }^{\prime} \mathrm{PCl}_{2} / \mathrm{Ar}^{\prime}{ }^{\prime} \mathrm{PCl}_{2}(0.01 \mathrm{~g}, 0.045 \mathrm{mmol})$ and $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}(0.01 \mathrm{~g}, 0.021 \mathrm{mmol})$ were placed in an NMR tube and dissolved in $\mathrm{C}_{6} \mathrm{D}_{6}$. The solution changed colour from yellow to red. The resulting solution was stirred for 18 hours.
${ }^{31} \mathbf{P}$ NMR (C6D6): $\delta 479.8$. ( $\mathrm{m},{ }^{1} \mathrm{~J}_{\mathrm{P} \text {-F }} 22.7 \mathrm{~Hz}$ ) ppm.

### 7.5.4 Attempted synthesis of $\mathrm{ArP}=\mathrm{AsAr}$

$\mathrm{ArPCl}_{2}(0.05 \mathrm{~g}, 0.022 \mathrm{mmol}), \mathrm{ArAsCl}_{2}(0.006 \mathrm{~g}, 0.022 \mathrm{mmol})$ and $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}(0.01 \mathrm{~g}, 0.021$ mmol ) were placed in an NMR tube and dissolved in $\mathrm{C}_{6} \mathrm{D}_{6}$. The solution changed colour from yellow to red. The resulting solution was stirred for 3 days. The ${ }^{31} P$ NMR spectrum only showed the formation of $\mathrm{ArP}=\mathrm{PAr}$.

### 7.5.5 Attempted synthesis of $\mathbf{A r P}=\mathbf{G e A r}_{2}$

$$
\mathrm{ArPCl}_{2}+\mathrm{Ar}_{2} \mathrm{GeCl}_{2}+\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6} \xrightarrow{\mathrm{C}_{6} \mathrm{D}_{6}} \quad \mathrm{ArP}=\mathrm{GeAr}_{2}
$$

$\mathrm{ArPCl}_{2}(0.01 \mathrm{~g}, 0.022 \mathrm{mmol}), \mathrm{Ar}_{2} \mathrm{GeCl}_{2}(0.015 \mathrm{~g}, 0.022 \mathrm{mmol})$ and $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}(0.01 \mathrm{~g}$, 0.021 mmol ) were placed in an NMR tube and dissolved in $\mathrm{C}_{6} \mathrm{D}_{6}$. The solution changed colour from yellow to red. The resulting solution was stirred for 3 days. The ${ }^{31} \mathrm{P}$ NMR spectrum only showed the formation of $\mathrm{ArP}=\mathrm{PAr}$.

### 7.5.6 Attempted synthesis of $\mathbf{A r P}=\mathrm{SnAr}_{2}$

$$
\mathrm{ArPCl}_{2}+\mathrm{Ar}_{2} \mathrm{SnCl}_{2}+\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6} \xrightarrow{\mathrm{C}_{6} \mathrm{D}_{6}} \quad \mathrm{ArP}=\mathrm{SnAr}_{2}
$$

$\mathrm{ArPCl}_{2}(0.01 \mathrm{~g}, 0.022 \mathrm{mmol}), \mathrm{Ar}_{2} \mathrm{SnCl}_{2}(0.016 \mathrm{~g}, 0.022 \mathrm{mmol})$ and $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}(0.01 \mathrm{~g}$, 0.021 mmol ) were placed in an NMR tube and dissolved in $\mathrm{C}_{6} \mathrm{D}_{6}$. The solution changed colour from yellow to red. The resulting solution was stirred for 3 days. The ${ }^{31} \mathrm{P}$ NMR spectrum only showed the formation of $\mathrm{ArP}=\mathrm{PAr}$.

### 7.5.7 Synthesis of $\mathbf{P t}\left(\mathbf{P P h}_{3}\right)_{4}$

$$
\left.\mathrm{K}_{2}\left[\mathrm{PtCl}_{4}\right]+2 \mathrm{KOH}+4 \mathrm{PPh}_{3}+\mathrm{EtOH} \longrightarrow \mathrm{Pt}^{( } \mathrm{PPh}_{3}\right)_{4}+4 \mathrm{KCl}+\mathrm{CH}_{3} \mathrm{CHO}+2 \mathrm{H}_{2} \mathrm{O}
$$

$\mathrm{PPh}_{3}(15.4 \mathrm{~g}, 5.9 \mathrm{mmol})$ was dissolved in 200 ml of absolute ethanol at $65^{\circ} \mathrm{C}$. When the solution was clear, a solution of 1.4 g of KOH in a mixture of 32 ml of ethanol and 8 ml of water was added. Then, a solution of potassium tetrachloroplatinate (II) $(5.24 \mathrm{~g}, 1.26$ mmol ) in water was slowly added to the alkaline triphenylphosphine solution while stirring at $65^{\circ} \mathrm{C}$. The addition was completed in about 20 min . A pale yellow compound began to separate within a few minutes of the first addition. After cooling, the compound was recovered by filtration, washed with warm ethanol ( 150 ml ), then with cold water ( 60 ml ) and again with cold ethanol ( 50 ml ). The resulting pale yellow powder was dried under vacuum.

Elemental analysis for $\mathrm{PtC}_{72} \mathrm{H}_{60} \mathrm{P}_{4}$ (1243.08): Calc C 69.50, H 4.86 \%, Found: C 69.8, 4.75\%.

### 7.5.8 Synthesis of $\mathbf{A r P}(\mathbf{C l}) \mathrm{CHCl}_{2}$

$$
\begin{aligned}
\mathrm{CH}_{2} \mathrm{Cl}_{2}+\mathrm{BuLi} & \longrightarrow \mathrm{CHLiCl}_{2} \\
\mathrm{CHLiCl}_{2}+\mathrm{ArPCl}_{2} & \longrightarrow \mathrm{ArP}\left(\mathrm{CHCl}_{2}\right) \mathrm{Cl}
\end{aligned}
$$

$\mathrm{BuLi}\left(7.4 \mathrm{ml}, 11.8 \mathrm{mmol}, 1.6 \mathrm{M}\right.$ in hexanes) was added dropwise to a solution of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $0.85 \mathrm{ml}, 11.8 \mathrm{mmol}$ ) in a $4: 1: 1$ mixture of pentane: $\mathrm{THF}: \mathrm{Et}_{2} \mathrm{O}$ at $-130^{\circ} \mathrm{C}$ with vigorous stirring. The mixture was allowed to stir for one hour and was then added rapidly through
a pre-cooled cannula to a solution of $\mathrm{ArPCl}_{2}(4.52 \mathrm{~g}, 11.8 \mathrm{mmol})$ in diethyl ether at $-130^{\circ} \mathrm{C}$. The solution was allowed to warm up and stirred for 4 hours. A precipitate of LiCl formed. The solution was filtered and the solvent removed under vacuum. The product was purified by distillation under reduced pressure, giving a colourless oil, Bp $70^{\circ} \mathrm{C}$ (0.03 Torr).
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 63.1$ (septet, $\left.{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 49.3 \mathrm{~Hz}\right) \mathrm{pm} ;{ }^{19} \mathbf{F} \mathbf{N M R}\left(\mathrm{CDCl}_{3}\right): \delta-55.3\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}\right.$ $49.3 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), -64.5 (s, $3 \mathrm{~F}, p-\mathrm{CF}_{3}$ ) ppm.

### 7.5.9 Synthesis of $\mathbf{A r P}=\mathbf{C C l}_{2}$

$$
\mathrm{ArP}\left(\mathrm{CHCl}_{2}\right) \mathrm{Cl} \xrightarrow{\mathrm{DBU}} \mathrm{Ar}=\mathrm{PCCl}_{2}
$$

DBU ( $1.05 \mathrm{~g}, 0.97 \mathrm{ml}, 7 \mathrm{mmol}$ ) was added dropwise to a solution of $\mathrm{ArP}(\mathrm{Cl}) \mathrm{CHCl}_{2}(3 \mathrm{~g}, 7$ mmol ) in THF. The solution was stirred for two hours giving an orange solution. The solvent was removed under vacuum, and the product purified by distillation under reduced pressure. $\left(\mathrm{Bp} 60^{\circ} \mathrm{C}\right)$.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 202.4$ (septet, $\left.{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 20.6 \mathrm{~Hz}\right) ;{ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-60.0\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 21\right.$ $\mathrm{Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}$ ), -63.9 (s, 3F, $p-\mathrm{CF}_{3}$ ) ppm.

### 7.5.10 Synthesis of $\mathbf{A r}^{\prime} \mathbf{P}(\mathbf{C l}) \mathbf{C H C l}_{2}$

$$
\begin{aligned}
\mathrm{CH}_{2} \mathrm{Cl}_{2}+\mathrm{BuLi} & \longrightarrow \mathrm{CHLiCl}_{2} \\
\mathrm{CHLiCl}_{2}+\mathrm{Ar}^{\prime} \mathrm{PCl}_{2} / \mathrm{Ar}^{\prime \prime} \mathrm{PCl}_{2} & \longrightarrow \mathrm{Ar}^{\prime} \mathrm{P}\left(\mathrm{CHCl}_{2}\right) \mathrm{Cl}
\end{aligned}
$$

$\mathrm{BuLi}\left(15.6 \mathrm{ml}, 25 \mathrm{mmol}, 1.6 \mathrm{M}\right.$ in hexanes) was added dropwise to a solution of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $1.6 \mathrm{ml}, 25 \mathrm{mmol}$ ) in a $4: 1: 1$ mixture of pentane: THF: $\mathrm{Et}_{2} \mathrm{O}$ at $-130^{\circ} \mathrm{C}$ with vigorous stirring. The mixture was allowed to stir for one hour and was then added rapidly through a pre-cooled cannula to a solution of $\mathrm{Ar}^{\prime} \mathrm{PCl}_{2} / \mathrm{Ar}^{\prime} \mathrm{PPCl}_{2}(6 \mathrm{~g}, 20 \mathrm{mmol})$ in diethyl ether at $130^{\circ} \mathrm{C}$. The solution was allowed to warm up and stirred for 4 hours. A precipitate of

LiCl formed. The solution was filtered and the solvent removed under vacuum. The product was purified by distillation under reduced pressure, giving a colourless oil, Bp $65^{\circ} \mathrm{C}$ (0.03 Torr).
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 65.3$ (septet, $\left.{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 48.8 \mathrm{~Hz}\right) \mathrm{ppm} ;{ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-53.9(\mathrm{~d}$, $\left.{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 49.3 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 7.5.11 Synthesis of $\mathbf{A r} \mathbf{P}=\mathbf{C C l}_{\mathbf{2}}$

DBU ( $2.85 \mathrm{~g}, 2.8 \mathrm{ml}, 18.8 \mathrm{mmol}$ ) was added dropwise to a solution of $\mathrm{ArP}(\mathrm{Cl}) \mathrm{CHCl}_{2}$ $(6.8 \mathrm{~g}, 18 \mathrm{mmol})$ in THF. The solution was stirred for two hours, giving an orange solution. The solvent was removed under vacuum and the product purified by distillation under reduced pressure. $\left(\mathrm{Bp} 62^{\circ} \mathrm{C}\right)$.
${ }^{31} \mathbf{P}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 207.6\left(\right.$ septet, $\left.{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}} 20.7 \mathrm{~Hz}\right) ;{ }^{19} \mathbf{F}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-59.6\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{P}-\mathrm{F}}\right.$ $\left.21.1 \mathrm{~Hz}, 6 \mathrm{~F}, o-\mathrm{CF}_{3}\right) \mathrm{ppm}$.

### 7.5.12 Synthesis of $\left[\mathbf{P t C l}(\mathbf{C l C}=\mathbf{P A r})\left(\mathbf{P P h}_{\mathbf{3}}\right)_{\mathbf{2}}\right]$

$$
\mathrm{Ar}=\mathrm{PCCl}_{2} \xrightarrow{\mathrm{Pt}_{2}\left(\mathrm{PPh}_{3}\right)_{4}} \quad \mathrm{PtCl}(\mathrm{ClC}=\mathrm{PAr})\left(\mathrm{PPh}_{3}\right)_{2}
$$

A solution of $\mathrm{ArP}=\mathrm{CCl}_{2}(0.24 \mathrm{~g}, 0.6 \mathrm{mmol})$ in toluene was added to a solution of $\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{4}(0.75 \mathrm{~g}, 0.6 \mathrm{mmol})$ in toluene. The resulting yellow solution was allowed to stir.

## Conclusions and Future Work

A series of new derivatives containing bulky electron-withdrawing substituents and some elements of groups 13,14 , and 15 has been synthesised.
Coordination of fluoromes or fluoroxyl ligands to boron or silicon revealed a fluorine/chlorine exchange, leading to the synthesis of $\mathrm{Ar}_{2} \mathrm{BF}, \mathrm{Ar}_{2} \mathrm{SiF}_{2}$ and $\mathrm{Ar}_{2} \mathrm{SiF}_{2}$, which have been structurally characterised.

For the first time, the crystal structures of derivatives containing three fluoroxyl ligands have been determined ( $\mathrm{Ar}^{\prime}{ }_{3} \mathrm{~B}$ and $\mathrm{Ar}^{\prime} \mathrm{Ar}{ }_{2} \mathrm{Sb}$ ). Phosphorus and arsenic derivatives have been extensively studied, with the isolation of $\operatorname{ArEX}_{2}, \operatorname{Ar}_{2} E X, \operatorname{Ar}^{\prime} \mathrm{EX}_{2}, \mathrm{Ar}^{\prime} \mathrm{EX}_{2}, \operatorname{Ar}^{\prime}{ }_{2} \mathrm{EX}$ and $\mathrm{Ar}^{\prime} \mathrm{Ar}^{\prime} \mathrm{EX}$ where $\mathrm{E}=\mathrm{P}$ or As and $\mathrm{X}=\mathrm{H}, \mathrm{Cl}$ or Br . For compounds containing Ar or Ar' and Ar", detailed T-dependence studies have allowed the calculation of rotational barriers. However, with group 14 elements, only chlorinated derivatives have been prepared so far. This could be extended to the bromide and hydride compounds, at least with tin and germanium derivatives, as halogen exchange might occur with silicon. Synthesis of Ar'Ar"BX should be tried as well in order to carry out variable temperature NMR studies to determined the rotational barrier of the molecule and compare it with those calculated in this work.

All derivatives structurally characterised have shown some intramolecular interactions between the fluorines of some of the $o-\mathrm{CF}_{3}$ groups and the central atom. These short contacts are believed to play an important role in the stabilisation of such molecule containing bulky electron-withdrawing substituents

New platinum cis and trans complexes have been prepared by treatment of phosphane derivatives with $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$ or $\left[\mathrm{PtBr}_{2}\left(\mathrm{PEt}_{3}\right)\right]_{2}$. Halogen exchange was observed when a bromophosphane was reacted with the chlorodimer. Cis isomers could be screened for anti-cancer activity.

Some advances have also been made in the field of multiple bonded main group derivatives. Attempts have been made to prepare new $\mathrm{P}=\mathrm{E}(\mathrm{E}=\mathrm{As}, \mathrm{Ge}, \mathrm{Sn})$ derivatives. $\mathrm{ArP}=\mathrm{PAr}$ and $\mathrm{Ar}{ }^{\prime} \mathrm{P}=\mathrm{PAr}$ ' have been prepared, but reaction between an arsane and a phosphane or a phosphane and a group 14 derivative has not been successful. However, this is a field of considerable interest, and some reactions could be tried, such as the synthesis of $\mathrm{ArAs}=\mathrm{AsAr}$ by reacting $\mathrm{ArAsCl}_{2}$ with $\mathrm{W}\left(\mathrm{PMe}_{3}\right)_{6}$ in a $2: 1$ ratio, to check the ability of the tungsten catalyst to remove chlorine from a derivative other than phosphorus.

If the synthesis of a $\mathrm{P}=\mathrm{As}$ compound is successful, reaction with $\left[\mathrm{PtCl}_{2}\left(\mathrm{PEt}_{3}\right)_{2}\right]_{2}$ should be attempted in order to study the coordination of the platinum. According to the results found in this work, platinum should only coordinate at the phosphorus atom. The reaction of certain phosphaalkenes with $\mathrm{Pt}\left(\mathrm{PPh}_{3}\right)_{4}$ clearly showed the formation of platinum(II) complexes and, in one case, the formation of a phosphabicyclo intermediate has been observed by NMR spectroscopy.

Alternative synthetic routes to phosphaalkynes could be explored, such as the reaction of ArCOCl and $\mathrm{P}\left(\mathrm{SiMe}_{3}\right)_{3}$ :

$$
\mathrm{Me}_{3} \mathrm{SiOSIMe}_{3}+\mathrm{ArC} \equiv \mathrm{P}
$$
