## Abstract

This report presents the latest estimates of Hong Kong domestic health spending for financial years 1989/90 to 2012/13, cross-stratified and categorised by financing source, provider and function.

Total expenditure on health (TEH) was HK\$112 144 million in the financial year 2012/13, with an increase of HK\$9668 million or 9.4% over the preceding year. TEH grew faster relative to gross domestic product (GDP) leading to a rise in TEH as a percentage of GDP from 5.2% in 2011/12 to 5.4% in 2012/13. During the period 1989/90 to 2012/13, total health spending per capita (at constant 2013 prices) grew at an average annual rate of 4.8%, which was faster than the average annual growth rate of per capita GDP by 1.9 percentage points.

In 2012/13, public and private expenditure on health increased by 8.3% and 10.5% when compared with 2011/12, reaching HK\$53 354 million and HK\$58 790 million respectively. Consequently, public share of total health expenditure dropped slightly from 48.1% to 47.6% over the year. Of private spending, the most important source of health financing was out-of-pocket payments by households (36.1% of TEH). Private insurance (7.3%) has taken over employer-provided group medical benefits (7.2%) as the second largest private payer as a result of the expansion of the insurance market.

Of the HK\$112 144 million total health expenditure in 2012/13, current expenditure comprised HK\$107 195 million (95.6%) and HK\$4949 million (4.4%) was for capital expenses (ie investment in medical facilities). Analysed by health care function, services of curative care accounted for the largest share of total health spending (66.4%) and comprised ambulatory services (34.4%), in-patient curative care (27.2%), day patient hospital services (4.3%) and home care (0.5%). Notwithstanding its small share, the total spending for day patient hospital services shows an increasing trend over the period 1989/90 to 2012/13, likely as a result of policy directives to shift the emphasis from in-patient to day patient care.

Hospitals accounted for an increasing share of total spending, from 28.2% in 1989/90 to 46.8% in 2002/03 and then dropped slightly to 42%-44% during the period 2005/06 to 2012/13, which was primarily driven by reduced expenditure by the Hospital Authority. As a result of the emerging infections that are of public health importance (eg avian flu, SARS, pandemic influenza) and the expansion of the private health insurance market in the last two decades, spending on provision and administration of public health programmes, and general health administration and insurance accounted for increasing, though less significant, shares of total health spending over the period.

Without taking into account capital expenses (ie investment in medical facilities), public current expenditure on health amounted to HK\$49 942 million (46.6% of total current expenditure) in 2012/13 with the remaining HK\$57 253 million made up of private sources of funds. Public current expenditure was mostly incurred by hospitals (73.5%), whereas private current expenditure was mostly incurred by providers of ambulatory health care (51.5%).

Although both public and private spending was mostly on personal health care services and goods (91.2% of total current spending), the distribution pattern among functional categories differed. Public expenditure was targeted at in-patient care (46.4%) and substantially less on out-patient care (27.6%). In comparison, private spending was mostly concentrated on out-patient care (43.2%), followed by in-patient care (25.5%) and medical goods outside the patient care setting (19.1%).

Compared to other economies, Hong Kong has devoted a relatively low percentage of GDP to health care in the last decade. As a share of total spending, public funding (either general government revenue or social security funds) was also lower than that in most economies with comparable economic development and public revenue collection base. Nonetheless, the Hong Kong health care system achieved service quality and health outcome that

fares well by global standards, indicating cost efficiency and effectiveness.

## Introduction

This article presents the latest estimates of domestic health spending in Hong Kong, following the previous figures published in June 2015.<sup>1</sup> It provides updated estimates of total expenditure on health (TEH) for the financial years 1989/90 to 2012/13 based on the established conceptual framework for Hong Kong Domestic Health Accounts (HKDHA),<sup>2</sup> originally adopted from the System of Health Accounts.<sup>3</sup> We also revised the previous estimates for the years 1989/90 to 2011/12 as more accurate data became available, allowing for retrospective comparisons and longer-term secular trend or time-series analysis.

The HKDHA is a set of statistics on health care expenditures, both public and private, in Hong Kong. It provides a detailed and complete picture of health care expenditures and facilitates comparison with other economies that adopt the same framework in calculating their health expenditures. Under the HKDHA, health expenditures consist of all expenditures or outlays for medical care, disease prevention, health promotion, rehabilitation, long-term care, community health activities, health administration and regulation, and capital formation with the predominant objective of improving health.

The HKDHA is a product of collaborative effort by many government bureaux/departments, public organisations as well as private institutions. It is compiled from a multitude of information sources. Most public expenditure data were derived from financial accounts, whereas private expenditure data came largely from survey estimates, and are subject to more uncertainties and reporting/recording errors.

The information contained in this report represents a basis for assessing and understanding trends and levels of health spending in Hong Kong. It enables the public, policy makers and researchers to assess the performance of the local health system over time, and to evaluate health expenditure-related policies.

## Total expenditure on health by financing source

### Total expenditure on health

In the financial year 2012/13, TEH was HK\$112 144 million, representing an increase of HK\$9668 million or 9.4% over the preceding year. In real terms, TEH grew by 6.1% in the same year, somewhat above the average annual rate of 5.9% throughout the period 1989/90 to 2012/13 (Fig 1 & Table 1).

In comparison, GDP in real terms grew at a lower rate of 2.3% in 2012/13 over the preceding

year, leading to a slight rise in TEH as a percentage of GDP from 5.2% in 2011/12 to 5.4% in 2012/13 (Table 1).

### Total expenditure on health per capita

During the period 1989/90 to 2012/13, per capita TEH grew steadily from HK\$5377 to HK\$15 892 at constant 2013 prices, faster than per capita GDP growth by 1.9 percentage points per annum on average (4.8% vs 2.9%). Disregarding the effects of the establishment of the Hospital Authority and the booming economy in the early-to-mid 1990s, growth of per capita TEH in real terms remained at 4.1% per annum on average since 1997/98, against the economic cycles during the period (Fig 2 & Table 2).

### Public and private expenditure on health

In 2012/13, public and private financing of health expenditure increased by 8.3% and 10.5% when compared with 2011/12, reaching HK\$53 354 million and HK\$58 790 million respectively. Consequently, public share of total health expenditure dropped slightly from 48.1% to 47.6% over the year (Table 3).

During the period 1989/90 to 2003/04, public expenditure at constant 2013 prices grew at an average rate of 9.7% per annum (from HK\$12 059 million to HK\$44 160 million), compared with a corresponding increase of 4.1% per annum (from HK\$18 516 million to HK\$32 346 million) for private expenditure, resulting in a growing share of public spending from 39.4% in 1989/90 to 57.7% in 2003/04 (Fig 3 & Table 3). The relative increase in the public share of TEH from 1989/90 through the early 1990s reflected the initial expansion of services offered by the newly established and consolidated Hospital Authority system. The stepped change in the relative proportions of TEH between 1997/98 and 1998/99 and the continued increase in public share until 2003/04 was likely a result of the Asian financial crisis and subsequent depressed economic cycle, followed by the SARS epidemic in 2003.

The observed decrease in public share following 2003/04 was the result of downward adjustment of Hospital Authority expense (and hence subvention), coupled with the expansion of the private market as evident from the substantial growth of private health spending in real terms at a rate of 7.0% per annum on average since 2003/04.

### Expenditure on health by financing source

As shown in Table 4, government and household out-of-pocket expenditure combined accounted for 83.2% to 88.4% of total spending throughout the period. While public spending overtook household out-of-pocket expenditure as the major source of health financing after 1991/92, the diverging

trends in relative proportions of public spending and household out-of-pocket expenditure reversed in 2003/04, from the largest difference of 28.2 percentage points in 2003/04 to 11.5 percentage points in 2012/13. The next important sources of health financing were employer-provided group medical benefits (7.2%-10.4%), and private insurance (1.2%-7.5%), which overtook the former by 0.5% in 2012/13 (7.2% vs 7.3%). They were followed by other private sources of funding (0.8%-2.2%). During the period, a growing number of households (mostly in the middle to high income groups) took out pre-payment plans to finance health care. As such, private insurance has played an increasingly important role in financing private spending (from 2.2% of private spending in 1989/90 to 13.8% in 2012/13), whereas both household out-of-pocket payments and employers expenditure decreased gradually over the period, from 77.4% to 68.8% for the former and 17.3% to 13.8% the latter (Fig 4).

### Total expenditure on health by function

Of the HK\$112 144 million TEH in 2012/13, HK\$107 195 million (95.6%) was current expenditure and HK\$4949 million (4.4%) was capital expenditure (ie investment in medical facilities). Services of curative care accounted for the largest share of TEH (66.4%) and comprised ambulatory services (34.4%), in-patient curative care (27.2%), day patient hospital services (4.3%), and home care (0.5%). The second largest share was for medical goods outside the patient care setting (10.0%). The remaining current expenditure was distributed among health programme administration and health insurance (4.8%), long-term care (4.5%), prevention and public health services (3.6%), rehabilitative and extended care (3.5%), and ancillary services to health care (2.8%) (Fig 5 & Table 5).

As a share of TEH, expenditure on in-patient curative care increased from 1989/90 to 2002/03 (from 21.1% to 28.2%) and remained relatively stable at 27%-29% thereafter. In comparison, the share of expenditure on ambulatory services reduced steadily from 41.9% in 1989/90 to 34.4% in 2012/13. Expenditure on day patient hospital services also showed an increasing trend relative to total health spending over the period 1989/90 to 2012/13. It was likely a result of policy directives to shift the emphasis from in-patient to day patient care, in line with the international trend (Table 5).

Other health-related functions that do not fall under the formal definition of TEH accounted for 5.3% to 8.7% of total health and health-related expenditure. Of these, during the period 1989/90 to 2012/13, research and development in health, and environmental health grew 1.1 and 1.0 percentage points respectively, whereas education and training

of health personnel shrank 1.0 percentage point (Table 5).

### Total expenditure on health by provider

In 1989/90, the largest share of TEH was spent on providers of ambulatory health care (44.4%), followed by hospitals (28.2%). As a result of a slower growth in spending on ambulatory services and a corresponding increase in the number, service spectrum and quality of hospitals during the period, by 1995/96 the situation had reversed, with the share of hospitals (38.6%) surpassing that of providers of ambulatory health care (38.4%). The upward trend in hospital share peaked at 46.8% in 2002/03 after which reduced expenditure of the Hospital Authority brought this share down to 42%-44% during the period 2005/06 to 2012/13 given the role of the largest provider of hospital care, although there was continued growth in the corresponding private spending after 1997/98 (Fig 6 & Table 6).

Relative to TEH, expenditure on nursing and residential care facilities (which mainly provide long-term nursing care) doubled from 1.8% to 3.7% from 1989/90 to 2012/13. Other industries, which represent providers of investment in capital formation and medical facilities, accounted for a diminishing share of total spending from 8.2% in 1989/90 to 2.2% in 2002/03. However, in response to the increasing demand for health care, both public and private sectors, inter alia, initiated a number of redevelopment or expansion projects that brought this share up to 4.4% by 2012/13. As a result of the emerging infections that are of public health importance (eg avian flu, SARS, pandemic influenza) and the expansion of the private health insurance market in the last two decades, spending on provision and administration of public health programmes, and general health administration and insurance accounted for increasing, though less significant, shares of total spending over the period.

### Current expenditure on health by function and provider

Tables 7 and 8 show the current expenditure on health by function and provider in 2012/13, without taking into account capital expenses (ie investment in medical facilities).

#### Provider structure of spending by function

Most of the total current expenditure was on out-patient care (HK\$38 539 million or 36.0%) which was provided by providers of ambulatory health care and hospitals in the ratio of 64.3% and 34.5%, with the remaining 1.2% by providers outside Hong Kong. Among providers of ambulatory health care, offices of medical practitioners accounted for the largest

share of expenditure (49.7%), followed by offices of dentists (10.6%) and offices of allied and other health professionals and other out-patient facilities (3.9%).

The next largest share of total current expenditure was in-patient care (HK\$37 777 million or 35.2%). Hospitals (76.9%) accounted for most of this expenditure, followed by providers of ambulatory health care (13.1%), nursing and residential care facilities (8.3%), and providers in the rest of the world (1.7%).

Of the HK\$5645 million on services of day care (5.3% of total current expenditure), 82.4% was allocated to hospitals, 14.2% to nursing and residential care facilities and 3.5% to providers of ambulatory health care. Expenditure on ancillary services to health care was HK\$3105 million (2.9% of total current expenditure), of which 42.6% was paid to laboratories and diagnostic imaging facilities and 57.4% to other providers of ambulatory health care.

HK\$1475 million (1.4% of total current expenditure) was spent on home care. Most of this expenditure was incurred by providers of home health care services (85.3%), with the remaining 14.7% at nursing and residential care facilities.

### Functional structure of spending by provider

About 44% of total current expenditure was paid to hospitals (HK\$46 979 million). The hospital expenditure by health care function was distributed to in-patient care (61.8%), out-patient care (28.3%), and services of day care (9.9%).

The next largest share (32.7%) of current expenditure was on providers of ambulatory health care (HK\$35 042 million), of which 70.7% was for out-patient care, 14.1% for in-patient care, 8.9% for ancillary services to health care and the remaining 6.3% for home care, services of day care, medical goods outside the patient care setting, and prevention and public health services. Among providers of ambulatory health care, offices of medical practitioners (both western and Chinese medicine) generated 77.7% of their revenue from out-patient care, 20.1% from in-patient care and substantially less from services of day care, medical goods outside the patient care setting, and prevention and public health services (2.2%).

### Current expenditure on health by provider and financing source

Tables 9 and 10 show the current expenditure on health by provider and financing source in 2012/13.

#### Spending structure of the financing sources

Public current expenditure on health amounted to HK\$49 942 million (46.6% of total current expenditure) and was mostly incurred by hospitals (73.5%), whereas private current expenditure

(HK\$57 253 million or 53.4% of total current expenditure) was mostly incurred by providers of ambulatory health care (51.5%). This reflects the mixed health care economy of Hong Kong where public hospitals generally account for about 90% of total bed-days (or 80% of admissions) and private doctors provide about 70% of out-patient care.

Other major providers financed by public current expenditure included providers of ambulatory health care (11.1%), provision and administration of public health programmes (6.7%) and nursing and residential care facilities (6.6%). Apart from paying for providers of ambulatory health care, private spending funded goods and services provided by retail sale and other providers of medical goods (18.8%), hospitals (17.9%) and general health administration and insurance (8.2%).

Employer-provided group medical benefits channelled 56.1% and 25.7% of their funds through providers of ambulatory health care and hospitals respectively, whereas private insurance channelled 41.1% and 20.2% respectively. Private household out-of-pocket payments funded a wide range of providers, the largest share being paid to providers of ambulatory health care (53.1%), the second to retail sale and other providers of medical goods (25.9%), and the third to hospitals (16.1%), mostly for private care but with a small share going to public hospitals as co-payments.

#### How the different providers are financed

Of the HK\$46 979 million spent on hospital care, 78.1% came from general government revenue, 13.9% from private household out-of-pocket payments, 4.4% from employer-provided group medical benefits, and 3.5% from private insurance.

The next largest share of current expenditure was used to finance providers of ambulatory health care (HK\$35 042 million or 32.7%), followed by retail sale and other providers of medical goods (HK\$11 105 million or 10.4%). The former had a mix of financing sources that included private household out-of-pocket payments (61.2%), general government revenue (15.8%), employer-provided group medical benefits (13.0%), private insurance (9.5%), and other private sources (0.5%). By contrast the latter was predominately paid by households (94.4%) and substantially less by the government (2.9%) and non-profit organisations (2.6%).

Similarly, for nursing and residential care facilities and provision and administration of public health programmes, most expenditure was publicly financed (79.8% and 98.2%).

### Current expenditure on health by function and financing source

Tables 11 to 13 show the current expenditure on

health by function and financing source in 2012/13.

### Functional structure of spending by financing source

Although both public and private spending were mostly on personal health care services and goods (91.2% of total current expenditure), the distribution pattern among functional categories differed. Public expenditure was targeted at in-patient care (46.4%) and out-patient care (27.6%). The rest of public funding was distributed to services of day care (10.0%), prevention and public health services (7.3%), ancillary services to health care (3.7%), home care (2.8%), health programme administration and health insurance (1.4%) and medical goods outside the patient care setting (0.7%).

In comparison, private spending was mostly concentrated on out-patient care (43.2%), in-patient care (25.5%) and medical goods outside the patient care setting (19.1%). Private household out-of-pocket payments were expended on various functions. The largest share was for out-patient care (48.8%), the second for medical goods outside the patient care setting (26.3%), followed by in-patient care (20.5%). Private insurance mostly funded in-patient care (33.4%) and out-patient care (25.0%).

### How the different functions are financed

General government revenue funded 61.4% of expenditure on in-patient care. The remainder was from private household out-of-pocket payments (22.0%), employer-provided group medical benefits (9.2%), private insurance (7.2%), and other private funds (0.3%). Funding for out-patient care was relatively more even: 51.2% from private household out-of-pocket payments, 35.8% from the government, 7.3% from employer-provided group medical benefits, 5.3% from private insurance, and 0.4% from other private sources.

Similarly, for home care and prevention and public health services, over 90% of the funding of each function was from the government and the rest was from private household out-of-pocket payments (4.2% and 8.5% respectively) and other private funds (<1%). Services of day care were also mainly financed by the government (88.1%), and the remainder from private household out-of-pocket payments (11.7%) and other private funds (0.2%). Ancillary services to health care were funded by the government (60.3%), private household out-of-pocket payments (21.5%), employer-provided group medical benefits (10.2%), private insurance (7.7%), and other private funds (0.3%).

Medical goods outside the patient care setting were predominately funded by private household out-of-pocket payments (94.5%); only 2.9% and 2.6% was from general government revenue and non-profit institutions respectively. As pharmaceuticals

and other medical non-durables made up about 80% of medical goods outside the patient care setting, the distribution of funds was similar (93.9% from private household out-of-pocket payments, 3.2% from the government and 2.9% from non-profit institutions).

When stratified by public versus private providers (Tables 11 to 13), public care was largely funded by government revenue (about and mostly above 90% for individual functions and 94.4% overall). The subsidy levels of in-patient and out-patient care, which consumed about 75% of government funds at public facilities, were 96.1% and 89.1% respectively; the remainder was paid out-of-pocket by households. In contrast, households, employers and insurers were the major payers in the private market, making up 92.6% of total expenditure. As for private in-patient care (including long-term care provided in nursing homes), 85.4% of expenditure was funded through private household out-of-pocket payments (46.3%), employer-provided group medical benefits (21.6%), private insurance (16.9%), and other private sources (0.6%), whereas the government paid for 14.6%. Private out-patient care was funded almost exclusively (98.6%) by private sources, namely households (77.2%), employers (12.1%), insurers (8.7%) and others (0.6%).

### International comparisons

Comparisons of TEH were made between Hong Kong and selected economies using the health statistics database compiled and maintained by the World Health Organization and released in 2016.<sup>4</sup> Such comparison cannot show whether a particular level of expenditure is appropriate. Instead, comparisons are useful in pointing out certain general patterns in spending. Hence, we should be mindful that comparisons of health expenditures and source of financing between countries or regions reflect each economy's own specific circumstances, societal values and solutions.

Table 14 provides the TEH as a percentage of GDP for Hong Kong and selected economies in 2002, 2007, and 2012. In the last decade, TEH as a percentage of GDP in Hong Kong was among the lowest. Nonetheless, the Hong Kong health care system achieved service quality and health outcome that fared well by global standards, at relatively low TEH as a percentage of GDP, indicating cost efficiency and effectiveness. Besides, Hong Kong public health expenditure should be considered in conjunction with its low tax regime and stringent control of government expenditure. When scaled by the public revenue base, Hong Kong public spending on health was only slightly lower when compared with other economies (ie just below the regression line in Fig 7).

Private household out-of-pocket expenditure and private insurance (ie sum of employer-provided

group medical benefits and individually purchased private insurance) accounted for a large share of total health spending in comparison with other economies, given that Hong Kong does not have mandatory insurance scheme, ie social health insurance (Table 15).

## Major differences between HKDHA and the Government Accounts

Notably, public health expenditure under the HKDHA covers a wider scope than government expenditure under the health policy area group in the Government Accounts (GA), and is therefore often higher than the latter.

Under the GA of the government budget, only direct expenditure by the Food and Health Bureau and the Department of Health (including the Bureau's allocation to the Hospital Authority), and expenditure directly related to health by other departments (such as the Government Laboratory) are counted as government expenditure under the health policy area group.

Under the HKDHA framework, apart from those classified as health expenditure under the GA, public health expenditures also cover other health-related functions performed by other government departments. For example, the HKDHA includes health expenditure on nursing homes, rehabilitation and medical social services under the Social Welfare Department, and ambulance service under the Fire Services Department and Auxiliary Medical Service, etc. These are not included in the government expenditure under the health policy area group in the GA.

The HKDHA is more comprehensive than the GA in terms of documentation of public health expenditure. As a result of the above differences, the HKDHA estimates on public health expenditure are essentially higher than the corresponding GA estimates. The difference amounted to 8% to 16% in 2007/08 to 2012/13. Table 16 is a comparison of the

estimated public health expenditures under HKDHA and GA.

## Acknowledgements

We thank colleagues on the Domestic Health Accounts Steering Committee, including Wendy Hung and Olivia Or (Census and Statistics Department), PH Chung and EK Yeoh (Chinese University of Hong Kong), Joe Chu (Department of Health), Alvin Chan, Kenny Hui, HW Liu, Karen Liu, and Eva Tsui (Hospital Authority), for participating in the updating exercise and providing important input. In addition, we are grateful to the following organisations for facilitating data collection and compilation: Hong Kong Private Hospitals Association, IMS ChinaMetrik Ltd, the Medical Insurance Association of the Hong Kong Federation of Insurers, and other data providers.

The opinions expressed here are the authors' and do not necessarily reflect those of the Government or any of the participating institutions and organisations.
