Definite discourse-new reference in L1 and L2: The case of L2 Mandarin

Abstract

Definite discourse-new bridging reference (e.g. a school…*the teacher*, Clark, 1975) is a complex syntax-pragmatic component of referential movement, one that is subject to relatively opaque form-function contingency with forms used for discourse-old reference, and that is especially prone to cross-linguistic influence. Research shows Asian second language (L2) learners of English struggle to produce bridging reference, yet little research has been done on the L2 production of bridging in Asian languages. We collected oral picture sequence narrative data from 80 lower-intermediate level L2 Mandarin learners from first language (L1) English (+article, n=23) and L1 Korean and Japanese (-article, n=57) backgrounds, alongside equivalent L1 data. Speakers of article-L1s were more likely than those from article-less L1s to use numeral + classifier NPs for non-bridging referents and demonstrative + classifier NPs when introducing bridging referents, essentially (and infelicitously) using these constructions as de facto English-like indefinite/definite articles in their L2 Mandarin production. Speakers of article-less languages infelicitously marked bridging relations with non-bridging forms. These findings confirm substantial cross-linguistic difficulties on the L2 marking of this complex syntax-pragmatic phenomenon, across relatively underexplored L1/L2 pairs.

1. **Introduction**

Reference is managed by language users via a range of linguistic strategies, globally in terms of topic structure, word order etc. and locally via the selection of referring expressions including *zero*, *pronominal* or *nominal* NP forms alongside the appropriate local marking of such forms across a given text. This allows language users and their audience to track referents as discourse

1

unfolds in a process known as *referential movement*, and as 'about every third word of discourse (sometimes even more than that) is dependent on the process of referential choice' (Kibrik, 2001:1124), referential movement occupies a critical role in the overall coherence of discourse, dealing with the central question of 'who did what to whom?'.

Unlike textual accounts of reference as a cohesive device (e.g. Halliday and Hasan, 1976, Hasan, 1984), current accounts of referential movement suggest that language users guide their audience in navigating the 'common ground' (following Stalnaker, 1974; see also Levinson, 2006; Clark, 2015) held in language at any given time, with referential relations emerging 'not in the text, but in two collaborating minds' (Gernsbacher and Givon, 1995: viii) in real time.

(1)   A: I just got back from Paris last week.

        B:<u>That</u> must have been an interesting trip.

(2)   A:Did you talk to Kate yesterday?

        B: Yes, I told <u>her</u> about the arrangements (Clark, 2015:330)

In both examples (1) and (2) above, language users' specific use of the demonstrative (1) or the pronoun (2) at that express moment (should) allow for the audience to resolve the reference with minimal processing effort (e.g. the 'minimize forms' principle of Hawkins, 2004) and without ambiguity. Incorrect or inappropriate NP selection will result in the audience's failure to correctly resolve the inference (or at least struggle to do so), potentially leading to miscommunication with accompanying breakdowns of coherence (Ryan, 2012). This is the logic behind the kind of cognitive, syntax-pragmatic scales or 'hierarchies' of referring expressions proposed in the literature that claim to account for which form may be used at which time. These include scales of NPs organised under *identifiability* (Gundel, Hedberg and Zacharski,

1993), *topicality* (Givón, 1995) or *accessibility* (Ariel, 1991, 1996, 2008, 2010), where particular referring expressions 'encode' (Ariel, 2008) a particular level of inference needed to resolve any reference towards a particular referent at any given moment. Taking Ariel's Accessibility Theory as an example, a language users' choice of referring expression at the moment of expression should consider the target referent(s)' relative *distance* between discourse-old and repeated mentions, *competition* between referents of similar types, degree of *salience* of the referent (see also *Centering Theory*, e.g. Grosz, Joshi, and Weinstein, 1995) and the *unity* (breaks in continuity) of reference within a given discourse sequence. The relative values of these criteria lead to the (near) universal positioning of all NP forms as *low* to *high* accessibility markers, suggested by Ariel to follow the order seen in the following scale:

> *Figure 1. The Accessibility Scale (taken from Ariel, 2008:44)*
>
> [Lowest] Full name > long definite description > short definite description > last name > first name > distal demonstrative > proximate demonstrative > stressed pronoun > unstressed pronoun > cliticised pronoun > verbal person inflections > zero [Highest]

Ariel (1996) also suggested a scale (for English) for discourse-new reference, starting from demonstrative NPs used for referent introductions ("this+N") followed by indefinite quantifiers (another+N), followed by discourse-new specific indefinite article NPs ("a+N") as NP forms encoding the perceived high to low accessibility of discourse-new referents between a speaker and their audience, with the indefinite article NP most commonly used for referent introductions where no lexical or inferable link (or 'anchor', Gardent, Manuélian, and Kow, 2003) can be derived between the discourse-new referent and any antecedent. Thus, this hierarchy for the referent 'a man' would be realised in text (in English, at least) roughly as follows:

(3) *A man* [discourse new, non-accessible] went into a store, where a woman was reading a magazine. *The man* [discourse old, intermediate accessibility] needed some food. *He* [discourse old, high accessibility] looked at some vegetables and Ø [discourse old, highest accessibility] took a potato. (Crosthwaite, 2017:542)

2. Bridging relations

As speakers use the form that they believe is most responsive to the state of shared knowledge with the addressee when introducing discourse-new referents, it is typical that language users use the NP form/position that commonly marks the highest level of accessibility along the hierarchy of NP forms available (Gundel, Hedberg and Zacharski, 1993). When introducing a specific, hearer-unknown referent into discourse for the first time (following Bickerton's [1981] distinction) in English, as mentioned, the indefinite article 'a/an' typically plays this role (alongside its role as a marker of generic and non-specific reference) (example 4), while other languages differ in the NP form used to mark such discourse newness. In Mandarin, for example, numeral + classifier NPs (一 'yi' [numeral] 个 'ge' [general classifier] + noun) are typically used, occasionally alongside use of existential markers (e.g. '有', yǒu – 'there is' in Mandarin) (example 5). In example (6), Korean uses post-nominal nominative marking (e.g. '가', 'ga' in Korean) alongside the use of first position in the sentence (examples taken from Crosthwaite, 2014b, 462-464):

(4)   A boy entered a restaurant (English)

(5)   有　　　一　　个　　男孩　　　走进 餐厅

        yǒu　　*yī*　*gè*　　*nánhái*　*zǒujìn cāntīng*

        There is **one CLS[1]   boy**   enter   restaurant
        'A boy entered a restaurant' (Mandarin)

(6)   한 아이가　　　식당으로　　　들어갔습니다.

        Hanaika　　siktangulo　　tulekasssupnita

        one boy-NOM   restaurant-into   enter-PAST-POL-DEC[2]

        'A boy entered a restaurant' (Korean)

In examples (4) to (6) above, there does not appear to be any kind of inferential relation between the two nominal referents (a boy, a restaurant), and the boy's discourse newness is marked as such in (4) via the use of the indefinite article, in (5) via the use of the existential marker 有 and the numeral + classifier NP (一个男孩); and in (6) via the numeral NP in first position with nominative marking (한 아이**가**).

However, it is often the case that a lexical relation (i.e. through synonymy, hyponymy, meronymy or thematic role) or inferable relation (i.e. through circumstantial or world-knowledge effects) may be derived from some aspect of the given or situational context and the discourse-new, hearer-unknown referent to be introduced as the discourse unfolds. What is more, where such a relation exists, a discourse-new hearer-unknown referent may be introduced via an NP form significantly *higher* along the informational hierarchy (i.e. a more *definite* NP form) than would be reserved for discourse-new referent with no lexical or inferable relation derivable, e.g the definite article in example (7), or the bare nominals in examples (8) and (9).

---

[1] CLS = Classifier
[2] NOM = nominative marker, PAST = past tense inflection, POL = politeness inflection, DEC = declarative inflection

(7) A man walks into a restaurant. *The waiter* gave him a menu [English]

(8) 有　　一　　个　　男孩　走　进　餐厅　，　**服务员**　给 他　一 份 菜单

　　yǒu　yī　　gè　　nánhái zǒu jìn cāntīng，**fúwùyuán** gěi tā　yī fèn cài dān

　　EXIST NUM CLS boy　enter restaurant.　**Waiter**　give him one CLS menu[3]

　　A boy entered a restaurant.　The waiter gave him a menu. [Mandarin]

(9)　　　　　　　　　　　　　　　　　　　.　　　　　　　　　　　　　　　　　　　.

　　Han namcaka siktangulo kelekassta. **Congepwen**i kunamcaeykey meynyuphanul cwesta.

　　One man-NOM restaurant enter-PAST-DEC. **Waiter**-NOM that-man-towards menu-ACC give-PAST-DEC

　　A man enters into a restaurant. The waiter gave him a menu. [Korean]

A definite NP is less likely to be used when either a lexical relation between given/new entities is absent/weak (or in the case of L2 learning, perhaps not known), or when inference needed to resolve the bridging relation via the situational/discourse context or 'world' knowledge resources becomes too great (example 10):

> (10) *I was looking at van Gogh's self portrait.* ***The missing ear*** *made me feel sad.*
>
> *I went to see some impressionist paintings.* ***The missing ear*** *made me feel sad.*
>
> *I went to a gallery yesterday.* ***The missing ear*** *made me feel sad.*
>
> (Wilson and Matsui, 1998:6)

Such referential relations are known as *bridging descriptions* (Clark, 1975; Clark and Haviland, 1977; Wilson and Matsui, 1998; Matsui, 2000, Crosthwaite, 2014a, 2014b, 2016a) or *associative* NPs (Hawkins, 1978; Poesio and Vieira, 1998)[4]. The use of bridging relation for discourse-new,

---

[3] EXIST = existential marker, NUM= numeral, CLS = classifier
[4] Due to overlap between definitions of lexical associative NPs and non-lexical 'bridging' relations in the literature, this paper terms all such relations/NPs as 'bridging' from this point.

hearer-unknown introductions is relatively less frequent than those for indefinite discourse-new hearer-unknown reference, as attested in Poesio and Vieira's (1998) corpus-based study of 1,412 L1 English definite article NPs, of which only 11% were determined to be bridging NPs. Because of the potentially vast pre-requisite lexical and pragmatic knowledge required to resolve bridging relations, these discourse-new definite NPs have attracted most attention in natural language processing studies, due to the difficulty such relations pose to automated co-reference resolution (Poesio and Vieira, 1998; Poesio and Artstein, 2008; Irmer, 2010; Ogrodniczuk and Zawisławska, 2016). In this regard, attempts have been made to provide taxonomies of bridging relations, notably Gardent, Manuélian, and Kow (2003), modified in Crosthwaite (2016a) (Table 1)

Table 1 – A taxonomy of bridging relations (modified from Gardent et. al. 2013)

Class (relation)	Criteria	Example
Set Membership/Synonym	Hyponymy	'Seminars…*the last seminar*'

Thematic	Based on thematic role (e.g. agent, patient, etc.)	'A murder…*the murderer*'
Definitional	Lexical definition or Meronymy	
Individual/Attribute		'A bicycle…*the price*'
Individual/Associate		'A government…*the opposition*'
Meronymic		
Whole/Part		'A room...*the ceiling*'
Whole/Piece		'A cake…*the slice*'
Collection/Member		'A forest…*the trees*'
Place/Area		'France…*the coast*'
Event/Subevent		'A war…*the battle*'
Individual/Function		'A club…*the owner*'
Co-Participants	Lexical definition of both target and anchor	'A hostage…*the kidnapper*'
Non-lexical	Circumstantial or world knowledge	'A laguna…*the inhabitants*' 'A fight…*the dead*'

3. Acquiring bridging in L2

It has been well documented that language-specific differences in referential movement generally cause difficulties for L2 learners, particularly when considering how (in)definiteness is (un)marked across languages. Such difficulties can and do lead to breakdowns in the referential coherence of the L2 texts/discourse produced (Crosthwaite, 2014a). This is because - despite the universal hierarchies for reference posited in Section 1 - the exact configuration of NP forms and structures along these hierarchies are *language-specific*. When an L2 learner is faced with the task of acquiring referential movement in the L2, differences in the forms used and complexity of the syntax/pragmatic distinctions involved in (in)definiteness marking across different languages often result in severe difficulties for processability of the L2 system (Pienemann, 1998), numerous sources of L1 transfer / interference (Ellis, 2006a, 2006b; Hawkins and Chan,

1997) and the recently discussed 'interface' learnability issues encountered when acquiring syntax-pragmatic or semantic-pragmatic distinctions in L2 (Sorace and Filiaci, 2006; Lardiere, 2009; Sorace, 2011). All these concerns result in a lengthy (and often unsuccessful) path to acquiring the L2 system, with Mandarin Chinese being no exception (Mai, 2015).

Specific to the acquisition of bridging relations, when acquiring the linguistic means of producing bridging in the L2, language learners are liable to face a myriad of problems. One such problem is that bridging is a relatively infrequent type of reference compared to that of definite discourse-old reference (most frequent) or indefinite discourse-new reference. As mentioned above, bridging reference accounts for just 11% of all discourse-new entities in English (Poesio and Vieira, 1998), and we do not expect the frequency of bridging in Mandarin (or any language) to be significantly different given the nature of bridging within referential movement generally (despite a lack of published corpus data on this phenomenon in other languages). Where the same type of marking is used for both bridging and discourse-old reference, as it is in English via the definite article, cue competition (where 'cues' related to linguistic features that trigger a cognitive response in a language learner, either explicitly or implicitly) and contingency effects between the two reference types prove difficult for L2 learners, who are generally predisposed to looking out for a one-to-one mapping of form to function (Andersen, 1984). Crosthwaite (2014b) showed that L2 learners were more likely to acquire the discourse-old usage of the English definite article someway *prior* in development to acquiring the use of the definite article for discourse-new bridging purposes, and as a collorary, L2 learners of English were also likely to associate the indefinite article with *all* discourse-new reference, infelicitously using this form where a bridging relation exists. According to Ellis (2006a), this is because L2 learners are 'intuitive statisticians' (2006:1) who acquire their L2 by

contingency (ΔP), learning particular form-function mappings by gathering information between cues and their outcomes, as well as information on salience and competition of such mappings in the target language, a difficult task given that natural language is 'a prime example of a stimulus environment rich in multiple cues' (Ellis, 2006:168). Despite being intuitive statisticians, L2 learners' intuitions in this regard are often incorrect.

A second problem for L2 learners when acquiring bridging is that of the well-documented potential for negative transfer (or lack of opportunity for positive transfer) from the L1. This is keenly felt between article/article-less L1/L2 pairs (Crosthwaite, 2016b; Dekeyser, 2005; Huebner, 1983; Young, 1996; Ionin, Ko and Wexler, 2004; Ionin, Baek, Kim, Ko, and Wexler, 2012; Ekiert, 2007, 2010; Diez-Bedmar and Papp, 2008). As the L2 learner's initial state is that of *tabula repleta* rather than *tabula rasa* (Ellis, 2006a), the L1 can exert considerable influence on the development of L2 definiteness marking as both L1 and L2 'compete for access to conscious awareness' (Ellis, 2006b:174), and with L1-learned form-function cues exceptionally difficult to restructure in adult life. In addition, as mentioned above, according to the interface hypothesis of L2 acquisition (Sorace and Filiaci, 2006; Lardiere, 2009; Sorace, 2011), cues that cut across syntax-pragmatic boundaries (including definiteness marking) are particularly hard to acquire. This is because one must learn both the syntactic markings of the L2 as well as the pragmatic distinctions involved in the selection of those markings, which are not always altogether clear from the input alone. This process is strongly mediated by the L1, causing certain learners to become more (or less, depending on the L1/L2 pair in question) sensitive to these distinctions. In this regard, Ellis (2006b) notes 'a sad irony for an L2 speaker [as] more input simply compounds their error; they dig themselves ever deeper into the hole created and subsequently entrenched by their L1' (p.185).

Given the difficulties outlined above when acquiring bridging in L2, a variety of studies from the East-Asian L2 English context have confirmed that L2 learners from Asian language backgrounds are unable to properly maintain L2 English target norms of syntax-pragmatic reference marking in L2 narrative production (Hendriks, 2003; Kang, 2005, 2009; Ryan, 2012, 2015, 2016; Crosthwaite, 2013; 2014a, 2016b). These studies look at the breadth of referring expressions produced by Asian learners of L2 English including zero, pronominal and full NP reference, using narrative picture descriptions or film retellings as the elicitation device. Such studies focus on whether the reference produced is an error (i.e. is incompatible with the L2 grammar) or whether the reference violates accessibility-based principles of economy of referential form through under/over-explicitness (i.e. a sequence of full NPs where pronouns may reasonably be used, e.g. the *repeated name principle*, Gordon, Grosz and Gilliom, 1993). In each case, differences between the L1/L2 referential systems are listed as the cause of frequent errors and/or over-explicitness in the L2 (at intermediate levels of proficiency, at least).

However, L2 acquisition of bridging relations has only been tested in two published studies thus far. Crosthwaite (2014b) used a narrative picture sequence production task on 10 L1 speakers of Mandarin, Korean and English and 60 Korean and Mandarin L2 English learners per language group (n=10 over six L2 proficiency levels), and showed that L1 Mandarin and Korean speakers learning L2 English acquired the use of the English definite article for bridging relations at around B1 - B2 level of the Common European Framework of L2 proficiency (CEFR, Council of Europe, 2001) – much *later* (pseudo-longitudinally, at least) than that of specific definite use of definite article NPs in these respective language groupings. This finding is suggestive of the effects of cue contingency and frequency of bridging relations in the input, as mentioned above.

Significant differences were also found in the way that L1 Mandarin and Korean (both technically *article-less* languages in the literature) encode bridging relations, with L1 Mandarin speakers clearly differentiating non-bridging reference (using numeral + classifier NPs) from bridging reference (using bare NPs). While bare nominals may be used for specific and non-specific indefinite reference or specific definite reference in Mandarin (Li and Thompson, 1981) following Bickerton's (1981) taxonomy of reference types, Hickmann, Hendriks, Roland, and Liang (1996) as well as Crosthwaite (2014b) found that numeral + classifier NPs are significantly *more* likely to be used for discourse-new specific indefinite reference than bare nominals are for this function, with bare nominals preferred for definite reference and bridging reference. L1 Korean speakers, however, were found to use bare NPs for both bridging and non-bridging discourse-new reference as well as discourse-old reference, leaving discourse status and bridging relations in Korean all to be inferred rather than marked explicitly. In light of these findings, the L2 English results suggested that Mandarin L2 English learners were able to utilise positive transfer from their L1 in terms of a shared syntax-pragmatic distinction between differential marking of bridging and non-bridging discourse-new reference between Mandarin and English (even though the forms used are different), while this distinction was unavailable for Korean L2 English learners. The Mandarin L2 English learners eventually acquired appropriate marking of bridging in English at earlier CEFR proficiencies (e.g. A2-B1 CEFR) than was seen in the Korean L2 English group (until at least C1 level). Thus, interference at the syntax-pragmatic level left the Korean L2 English at a significant disadvantage compared to their Mandarin L2 English counterparts.

4. Rationale for present study

While research has so far concentrated on East-Asian learners of L2 English (because in Asia this perhaps accounts for the majority of second language learners of any language), there are very few studies of bridging production in article-less languages, with potentially no study having been carried out regarding the L2 acquisition of bridging in an article-less language.

The body of English-language studies on L2 Mandarin is summarised in Zhao (2011), including topics such as verb-raising, aspect markers, wh-words, causative/resultative compounds, topic and *bei/ba* structures, and relative *de/er* clauses, with very little explicitly covering reference. With the exception of child language studies (Hickmann, Hendriks, Roland, and Liang, 1996), the majority of studies on the syntax-pragmatic referential system of Mandarin are written in Chinese-language journals (Xu, 2000, 2002; Shi, 2002). The findings of these studies generally follow the claims of a much smaller number of English-language studies (e.g. Hedberg, 1996; Liu, 2010, etc.) in that numeral + classifier NPs appear to function similarly to that of English indefinite article NPs and that demonstrative NPs (e.g. 这个+N or 那个+N) are increasingly used as mid to low accessibility markers in a similar manner as the English definite article.

Another review of L2 Mandarin research (Mai, 2015) also points out that most studies of L2 Mandarin only look at acquisition of L2 Mandarin by speakers of English or other (typically article-L1) European languages, and do not compare production of these learners with L2 production from L1 speakers of languages typologically more similar to Mandarin, such as Korean or Japanese. As with Mandarin, these L1s include classifiers, grammatical aspect markers and prenominal relative clauses, and so do not have to 'establish processing routines of those structures from scratch' (2015:131), yet there is little comparative research available. A notable exception is Liang (2006), who studied L2 acquisition of numeral + classifier NPs by Japanese and English native speakers, noting errors with incompatible numeral + classifier NPs

with plural referents by the English learners at even advanced stages of proficiency, suggesting a gap between syntactic and semantic acquisition of the form. Crosthwaite (2014a, 2014b) stands as another exception to the dearth of studies on Asian referential systems by including L1 Mandarin and Korean data on bridging, determining that in Mandarin, for bridging referents, numeral + classifiers are omitted before the noun, with Korean making no distinction on the NP for bridging or non-bridging reference.

Yet, with the exception of these studies, only one published Chinese-language doctoral dissertation specific to bridging in Mandarin appears to exist (Mo, 2005) and one or two Chinese-language journal articles have dealt with the topic (Mo, 2004; Xu, 2007). There are no current papers covering L2 Mandarin production of bridging reference by speakers of either article- or article-less L1s. As bridging is a key part of the syntax-pragmatic paradigm of reference marking, and as bridging has already been explored from the article-less L1 source to article-L2 target perspective, such a study would provide useful data regarding the learnability of a relatively low-contingency form-function mapping, and the extent to which cross-linguistic influence affects the acquisition of this key referential function among an underexplored set of L1/L2 target pairs. This paper intends to fill this research gap.

5. Method

a. *Aims and research questions*

This study set out to explore how L2 learners of article- or article-less L1s manage the introduction of definite discourse-new bridging reference in L2 Mandarin narrative discourse. The research questions are as follows:

RQ1: How do learners of L2 Mandarin manage the introduction of bridging (and new, non-bridging) reference?

RQ2: Is there an effect of the article status of the L1 (article vs. article-less) on the NP forms used to introduce bridging/new, non-bridging reference in L2 Mandarin?

b. *Participants*

i. *L1 participants*

In order to hypothesise the potential for L1 interference during L2 Mandarin production of bridging reference between speakers of article-L1 / article-less L1 languages, data was collected from 20 monolingual L1 Mandarin speakers, 20 article-L1 (English) speakers and 20 article-less L1 speakers (in this case 20 L1 Korean speakers). English and Korean were chosen as representative of article- vs. article-less L1 approaches respectively, as these represented the vast majority of the distribution of participants of these two groups for the L2 study. Their data was not taken in Hong Kong, rather, it was taken in each native setting. Although some of the article-less L2 cohort are from L1 Japanese backgrounds, the definiteness system and bridging reference system of Japanese is largely similar to that of Korean in that pronouns are seldom used, both languages lack articles, and bridging is realised through bare nominals, as with example 10 where *result* (*Kekka*) has a bridging relation to *questionnaire*:

(10)   *2006 FIFA world cup-no yushokoku yosou   enquˆete-wo   okonatta.*

2006 FIFA world cup   winner   expectation **questionnaire** conducted

(The expectation questionnaire about 2006 FIFA world cup winner was conducted)

***Kekka**-wa Brazil-ga top-datta. Kuwasii enquˆete   kekka-wa HP-de.*

result   Brazil   top   detail   questionnaire result   web page

(The top of the questionnaire result was Brazil. The detail of the result appeared in web page, Sasano, Kawahara and Kurohashi, 2007: 130)

The L2 English proficiency of the Asian language speakers was not tested, but the L2 Mandarin proficiency of the non-Mandarin speakers involved in the L1 data collection was nil, and none of the participants tested expressed any knowledge of Cantonese at the outset. As the listener of the narratives was a native speaker of the L1 background of the participant, it was unlikely that any second language effects would find their way into the L1 production.

ii. L2 participants

The L2 Mandarin participants in the study were all undergraduates studying non-credit bearing Mandarin courses as part of their studies at a university in Hong Kong. These were all drawn from numerous cohorts of the University's 'Level 4' L2 Mandarin course structure. All students at this level had taken an in-house placement test to get on to this level, and we specifically selected students who had received scores on our test deemed equivalent to *Level 3* of the standardized Chinese language proficiency test *Hanyu Shuiping Kaoshi* (HSK), placing each student at approximately equivalent to B1 of the equivalent CEFR scale for English. Students at HSK level 3 "can communicate in Chinese at a basic level in their daily, academic and professional lives. They can manage most communication in Chinese when travelling in China." (http://www.chinaeducenter.com/en/exams.php). Students at 'Level 4' of our course but whose placement test scores were equivalent to lower HSK levels (e.g. level 2) were not selected,

leaving each L2 student (either from article-L1 or article-less L1 groups) of the same relative proficiency, although our in-house test is only a rough measure of HSK scores, and with very few students entering our programs actually having actually sat the official HSK test. No L2 students expressed knowledge of Cantonese at the outset of the study. Students of lower L2 proficiencies were unlikely to be able to complete a full narrative picture sequence task and were not invited to join the study.

In total, from the article-less L1 group, 45 L1 Korean speakers and 12 L1 Japanese speakers joined the study. From the article-L1 group, 12 L1 British English speakers, 5 L1 Australian English speakers and 6 L1 American English speakers joined the study. The overall numbers of participants is small but reflective of the general L2 Mandarin learning population of the non-credit language courses at the level and context in question across two semesters of data collection. Given that the study is conducted in HK, participants from article-less L1 backgrounds outnumber those of article-L1 backgrounds almost 2 to 1, which reflects the general demographics of the international student population at the university. The majority of the L2 data was taken from undergraduates (81.2%) who had been in Hong Kong for an average of one year, and were largely female (82%). The average duration of study among all participants was 3 years (part-time, at least), with most beginning their Mandarin studies as an additional language during high school. Classes on these non-credit bearing courses are taught entirely in native Mandarin.

        c. Materials

The picture sequence used in both the L1 and L2 studies was a revised version of the sequence used in Crosthwaite (2014a, 2014b), and a numbered version of the sequence can be seen in Appendix A. As with those studies, the story's structure was normalized for

narrative and episodic structure using Stein and Glenn's (1979) 'story grammar' model, where a main character overcomes a difficulty with a given situation (in this case, a game of basketball). A school setting is introduced in Pictures 1, 2 and 6, ensuring that the situational setting is "retained in peripheral consciousness as background orientation for the particular, localized events which may then be focused on" (Chafe, 1980, p. 42), in order that certain bridging relations may be derived from this situational context. The materials in the present study greatly expand the potential for bridging relations as a whole and for certain relation categories in particular from those seen in previous research.

d. Procedure

All participants (L1 and L2) were invited into a quiet room individually by one of the researchers (the selection of whom was dependent on L1 background of the participant, in each case the researcher was a native speaker of the participant's L1). One (identical) copy each of the picture materials was placed in three separate envelopes marked A, B, and C on a desk in front of the researcher and participant. The researcher read out the instructions of the task to participants in their native language, which stated that participants were to select one of the envelopes marked A, B, or C (while the researcher looked away), and to remove the picture sequence, holding it away from the researcher's view, and to place the remaining envelopes in a box under the desk. The participant was informed that envelopes A, B and C contained different sequences and that the researcher had no idea which sequence the participant had selected, and would, following the narration, have to guess which envelope the participant had picked at a later time when comparing the 'three' sequences with the recorded narratives. This procedure ensures no assumed mutual knowledge of the sequence between researcher and participant, avoiding conditions for unnecessary deictic reference production (either non-verbally by pointing at referents

or verbally such as 'that window you can see in picture 4'). Participants were asked to tell the story in third rather than first person. Participants could take as long as needed before beginning their narrative, allowing them to conceptualise the entire narrative as a series of sequential episodes (or macrostructures, following Van Dijk, 1976) necessary for global coherence. Participants were encouraged to treat the narrative as a real 'story' with a true introduction and conclusion and not to simply relate what they saw in the numbered order of the sequence as separate events (i.e. 'in picture 1 we see…in picture 2 we see…) but rather as a connected whole, and (where possible) to make the story as interesting as possible. Participants in the native groups took 2–3 minutes to observe the sequence before beginning, while participants in the L2 groups took an average 4-5 minutes.

Participants were notified that there was no time limit on their performance of the narrative so as to avoid any perceived pressure of time and were also informed that they may continue to view the sequence while telling the story so as to avoid pressure to memorise the events in the sequence. When the participant signalled their readiness, an MP3 recorder was started and the participant told their story to the researcher, who was instructed to 'actively listen' by offering linguistic (e.g., "hmm," "OK") and paralinguistic cues (e.g., nods, smiles), as absence of these cues has been shown to cause L1 and L2 participants' narratives to more frequently break down (Crosthwaite, 2011) . For the L2 participants, during performance of the narrative, to avoid the potential for limits in learners' lexical repertoire for encoding the depicted events to be the cause of NP selection rather than knowledge of which NPs to use for bridging/non-bridging contexts, questions about vocabulary could be glossed with single words if the participant was able to provide a gesture (e.g. 'shooting' a ball) or oral description (e.g.,

'that thing the ball goes into in a basketball game') except for target referents (researchers asked participants to 'move on' or 'what happened next' for questions about target referents). In the event of sustained pauses (over 20 seconds), the researcher also prompted the participant to move on to the next picture in the sequence. Once the narrative was complete, the participants returned the sequences to the envelope (ensuring the researcher could not see either sequence or envelope), and returned the envelope to the box for the next participant.

e. *Data analysis*

All audio files were transcribed verbatim into Mandarin (L1 and L2), English (L1) or Korean (L1) scripts respectively by a native-speaking researcher with the same L1 background as the participant, and the first mention of all target referents were scored by the researcher who had transcribed the text, noting the NP form used. The target new non-bridging referents are:

BOY (Picture 1)

BASKETBALL (Picture 2)[5]

GIRL (Picture 7)

WINDOW (Picture 9)

CAR/TRUCK (Picture 12)

DOG (Picture 16)

The target bridging referents are shown in Table 2, with the picture number of the sequence where the referent is first seen shown in parentheses:

---

[5] if the speaker has not mentioned that BOY is playing basketball, e.g. 'The boy had *a ball*'

Table 2. Target bridging referents and relation type.

Bridging referent (Picture first seen)	Relation type
HOOP/NET/BASKET [or variants of] (2 or 5)	World Knowledge (sports)
COURT (2,3,4)	World Knowledge (sports)
PLAYGROUND (2,3,4) (if speakers has not referred to COURT but has referred previously to SCHOOL)	Whole/Part (of school)
AIR (3) (ball is thrown up in the…)	Place/Area
GROUND (4) (ball bounces on the…)	Place/Area
CHILDREN/CLASSMATES/STUDENTS (when mentioning BOY1 and GIRL1 together) (potentially 7,8,15,16,19,20, but only for one possible instance)	Set membership/Synonym
CLASSROOM (10)	Whole/Part (of school)
STUDENTS (10)	Individual/Function (school/students)
TEACHER (10)	Individual/Function (school/teacher)
WINDOW (11)	Whole/Part (room)
DRIVER [of the car] (13)	Individual/Function (car/driver)
ROOF [of the car] (14)	Whole/Part (car)

Certain target bridging referents (CLASSROOM, PLAYGROUND) were only coded as such if the school itself was introduced explicitly beforehand, allowing the bridging relation to be drawn. The school was not explicitly mentioned in 3 out of the 23 article-less L1s only, and in each of these three, the CLASSROOM was explicitly named as such, allowing for bridging relations to TEACHER/STUDENTS etc. to at least be made.

The three Mandarin speaking researchers periodically checked each other's scoring (L1 and L2) for accuracy, making amendments where required. Immediate self-corrections to references (e.g. 'a teacher..,*the* teacher…') were counted as valid (with the original reference disregarded), while new referent repetitions (the teacher…the teacher) were not counted. Occasionally participants selected a name or a description of a referent that did not link to the character's role in the narrative (e.g. the use of 'an old woman' to describe the teacher). In such cases no bridging reference occurs, and so such instances are not included in the analysis, and made up only a very small amount (<5) of the total references to bridging referents in either the L1 or L2 data. For cases where participants topicalised certain referents (e.g. Levinson, 2000) and therefore digressed from the presented picture order (e.g. a car [12] -> the driver [13] vs. a driver [13] -> the car [13,12]), we treated either order as representative of bridging if a suitable bridging could still reasonably be derived.

6. Results

a. L1 data

This section represents the findings of the L1-only narratives from L1 Mandarin, article-L1 and article-less L1 participants, so as to formulate potential hypotheses for the L2 study.

Figure 2. Article-L1 introductions

[Insert figure 2 here]

Figure 2 represents the introductions by the article-L1 (English) group by referent type. As with Crosthwaite (2014a, 2014b), there is a marked preference for indefinite article NPs with new non-bridging referents, while bridging referents are typically introduced with definite article NPs.

(11, new, non-bridging) There's *a young guy* standing in front of a school, holding *a basketball*

(12, bridging) It smashes the top of a truck, and the guy, *the driver*, goes through *the door* and comes out on *the roof*.

Figure 3. Article-less L1 introductions

[Insert figure 3 here]

Figure 3 represents the introductions by the article-less L1 group (in this case, Korean, although very similar to the referential system of Japanese) by referent type. As with Crosthwaite (2014a, 2014b), there is little distinction for inferability as reflected in NP selection, with bare nominals equally as likely to be used for specific indefinite and bridging referent types.

(13, new, non-bridging) 학교운동장에 **학생**이 **농구공**을 가지고 있습니다.
hakkyowuntongcangey **haksayng**i **nongkwukong**ul kaciko isssupnita.
School playground-LOC **student**-NOM **basketball**-ACC has-POL-DEC
A boy has a basketball at school.

(14, bridging) 공이 학교 교실로 들어가 버렸네.
changmwunulo kongi hakkyo kyosillo tuleka pelyessney
Window-through ball-NOM school classroom-into gone throw-PAST
The ball entered through a/the classroom window
선생님이 공을 밖으로 던졌습니다.
sensayngnimi kongul pakkulo tencyesssupnita.
Teacher-NOM ball-ACC outside-to throw-PAST-POL-DEC
The teacher threw the ball outside.

For the two animate, main characters (BOY and GIRL), numeral+N / N+numeral NPs or the use of quantifiers such as 'another –   ' or 'some –어   ' were occasionally used for introductions but not for other non-bridging types such as CAR or DOG or SOCCER BALL. An interesting finding of this data is that of the Koreans' repeated mentions of the driver's FOOT in kicking the ball, constituting a part/whole bridging relation. This was not part of the target list but was commented on by 8 of the 10 participants in the L1 Korean data only.

Figure 4 represents the introductions by the L1 Mandarin group by referent type.

Figure 4. L1 Mandarin introductions

[insert figure 4 here]

The findings largely follow those of previous research in that specific indefinite referents tend to receive numeral + classifier NPs while bridging referents tend to receive bare nominals.

(15, new, non-bridging) 有 一个　　　　　男生　很　喜欢　去 打 篮球

yǒu yī gè　　　　　nánshēng hěn xǐhuān qù dǎ lánqiú
EXIST NUMCLASS schoolboy very like　go play basketball
There was a schoolboy who liked to go and play basketball

(16, bridging) 他们 俩 后来 就 回到 **教室**　里 一起　听 **老师**
tāmen liǎ hòulái jiù huídào **jiàoshì**　lǐ　yīqǐ　tīng **lǎoshī**
They　both later then return **classroom** inside together hear **teacher**
They both later returned to the classroom to hear the teacher together

Many of the numeral + classifier NPs used for new non-bridging reference are preceded by the existential marker '有 – yǒu'[6]. We also note an equal use of demonstrative + classifier NPs for both bridging and new non-bridging referents, and a slightly higher use of noun + attributive marker NPs for bridging referents over new non-bridging referents (notably TEACHER and

[6] The scoring for 'existential' in figure 6 only includes introductions where the existential marker is used *without* an accompanying numeral + classifier.

DRIVER), although the L1 Mandarin speakers also on occasion produced complex existential + numeral + classifier + noun + attributive marker NPs, e.g.:

(17) 小 狗 看 到了 远方 有 一个 崭新 的 足球

xiǎo gǒu kàn dàoliǎo yuǎnfāng yǒu yī gè zhǎnxīn de zúqiú

small dog see finally far away EXIST NUMCLASS brand-new ATT soccer ball.

Finally, the little dog saw in the distance there was a brand-new soccer ball.

Such mentions were coded as numeral + classifier NPs for scoring purposes, but represent a level of syntactic complexity that was not seen in the L2 data by either the article- or article-less learner groups.

In summary, each L1 appears to mark bridging and new non-bridging reference differently, with NP form in line with that of Crosthwaite (2014a, 2014b), as summarized in Table 3:

Table 3. L1 NP forms for bridging and non-bridging reference

L1	Non-bridging	Bridging
Article-L1 (English)	Indefinite article + N	Definite article + N
Article-less L1 (Korean)	Bare N	Bare N
Mandarin	Numeral + classifier + N	Bare N

These results lead to the following potential hypotheses for the L2 data. On the one hand, speakers of article-L1s such as English appear to make a distinction for inferability on the NP form, as do L1 Mandarin speakers. However, bridging introductions in L1 Mandarin are realised through bare nominals, while for speakers of article-L1s, the definite article is overwhelmingly used. As definite articles do not exist in Mandarin, and given that discourse-old low-accessibility reference is often marked by demonstrative + classifier NPs (Hedberg, 1996; Liu, 2010),

speakers of article-L1s may likely infelicitously overuse the Mandarin demonstrative + classifer NP form to mark bridging reference, treating it as a *de facto* English-like definite article as they would in their L1. On the other hand, speakers of L1 Korean (representing the majority of the article-less L1 speakers in the L2 data, although the Japanese system is largely identical) do not make a distinction for inferability on the NP form, and for bridging, use the same form as that of the L1 Mandarin speakers, namely the bare nominal. Given the high frequency of numeral + classifier introductions in L1 Mandarin, cues from the input should be sufficiently strong so as to encourage speakers of article-less L1s to adopt this NP form for non-bridging referents, yet given the low frequency of demonstrative + classifier NPs for bridging reference in L1 Mandarin, speakers of article-less L1s are, presumably, significantly less likely to use demonstrative + classifier NPs for bridging reference than speakers of article L1s.

b. *L2 data*

Figure 5 represents the introductions of non- bridging referent types by L2 Mandarin learners from both article and article-less L1 groups, with the data from the L1 Mandarin speakers shown for reference, and with raw values shown in the columns.

Figure 5. Introduction of non-bridging target referents by L2 Mandarin learners

[insert figure 5 here]

While speakers of both article- and article-less L1s are largely following the L2 target system by marking non-bridging referents with numeral + classifier NPs, the data does suggest a distinction between article-L1 and article-less L1 groups in the frequency of use of these NPs over the use of other forms. Namely, one might assume that those from article-L1 backgrounds are substituting the numeral + classifier construction into a *de facto* English indefinite article-like

usage, while those from article-less L1 backgrounds are more likely to use a wider variety of NP

forms. As the distribution of discourse-new reference for each NP form / target is binomial,

binary logistic regression analysis was used to determine whether the status of the speakers' L1

(article- or article-less language) is a significant predictor of the use of numeral + classifier

introductions for non-bridging referents. The analysis suggests that the status of the speakers'

L1 (article- or article-less language) is a significant predictor of such introductions ($\chi2=10.36$,

df=1, p<.001) – in fact, speakers from article L1 backgrounds were 2.3 times as likely to use this

construction than speakers of article-less L1 backgrounds ($\beta=.846$ Wald=9.56, *p=.002*,

$Exp(\beta)=2.33$[7]). For reference, when L1 Mandarin data is added to the model ($\chi2=10.71$, df=2,

p=.005), there is no significant difference between the article-less group's predicted use of

numeral + classifier NPs and that of L1 Mandarin ($\beta=-.090$ Wald=.142, p=.706, $Exp(\beta)=.914$),

while there is a significant difference between L1 Mandarin speakers' and article-L1 L2

Mandarin learners' use of this NP form for this function ($\beta=-.756$ Wald=5.897, p=.015,

$Exp(\beta)=2.13$).

Figure 6 represents the distribution of introductions by the L2 learners for bridging referent types,

with L1 Mandarin data shown for reference, and with raw values shown in the columns:

Figure 6. Introduction of bridging target referents by L2 Mandarin learners
[Insert figure 6 here]

The data suggests a distinction between article-L1 and article-less L1 groups for the use of

demonstrative + classifier NPs to introduce bridging referents, leading to the assumption that

many of those from the article-L1 group may be substituting the demonstrative + classifier

---

[7] β= slope of regression model (positive/negative), Wald=test statistic, Exp(β)=effect size of predictor in model, e.g. if Exp(β)=2.00, then the predictor is twice as likely to occur than the constant (i.e. the remaining variables not included in the model).

construction into a *de facto* English definite article-like usage as was hypothesised from the differences between the English and Mandarin L1 data. A logistic regression analysis was used to determine whether the status of the speakers' L1 (article- or article-less language) is a significant predictor of the use of demonstrative + classifier introductions for bridging referents. The analysis suggests that whether the speaker came from an article/article-less L1 was a significant predictor of the use of this NP form to introduce bridging referents ($\chi2$=51.71, df=1, p<.001). In fact, speakers from the article-L1 group were as much as 12.1 times as likely to use this construction than speakers of article-less L1s (β=2.50, Wald=41.93, p<.001, Exp(β)=12.188). For reference, when L1 Mandarin data is added to the model ($\chi2$=54.65, df=2, p<.001), there is no significant difference between the article-less group's predicted use of demonstrative + classifier NPs and that of L1 Mandarin (β=-.562, Wald=1.22, p=.269, Exp(β)=.570), while there is a significant difference in between L1 Mandarin speakers' and article-L1 L2 Mandarin learners' use of this NP form for this function (β=1.93, Wald=18.94, p<.001, Exp(β)=6.94)

However, we also note a significantly higher number of infelicitous numeral + classifier NPs for bridging reference from the article-less L1 group than the article-L1 group, suggesting that those from the article-less L1 group are tending to mark all new reference (bridging or non-bridging) via numeral + classifier NPs. This finding was confirmed by another logistic regression analysis $\chi2$=38.17, df=1, p<.001) suggesting that those from article-less L1s were 18 times as likely to use this NP form when referring to bridging referents than those from article-L1s (β=2.91, Wald=16.01, p<.001, Exp(β)=18.46). For reference, when L1 Mandarin data is added to the model ($\chi2$=51.41, df=2, p<.001), there is no significant difference between the article-L1 group's predicted use of numeral + classifier NPs and that of L1 Mandarin (β=-1.13, Wald=1.85, p=.173, Exp(β)=.323), while there is a significant difference in between L1 Mandarin speakers' and

article-less L2 Mandarin learners' use of this NP form for this function (β=1.78, Wald=16.11, p<.001, Exp(β)=5.96).

7. Discussion

The results as presented are, at the time of writing, the largest controlled evidence of the use of bridging relations in L2 Mandarin discourse by speakers of article- and article-less first languages, demonstrating the marking and selection of both lexical and inferential bridging relations that native and foreign language users of Mandarin produce during narrative production. For RQ1 (How L2 Mandarin learners manage bridging), it appears as though speakers of both article- and article-less L1s are sensitive to the syntax-pragmatic distinction in Mandarin between bridging and non-bridging reference, clearly marking both referent target types differently. While this finding was hypothesized for speakers of article-L1s under Crosthwaite (2014b) as both English and Mandarin mark for inferability on the NP, the similar findings for the article-less L1 group suggest that it is also a relatively straightforward matter for speakers of article-less L1s to adopt the bridging marking norms of the L2 target. If we follow Ellis' (2006a, 2006b) approach to the discussion of L2 acquisition, while bridging is a relatively infrequent phenomena compared to that of indefinite discourse-new or definite discourse-old reference, it may be the case that the syntax-pragmatic distinction between bridging and non-bridging reference in Mandarin is particularly salient (definite, specific usages of the bare nominal nonwithstanding), although it is 'hard to agree on an operationalizaton of salience in syntax', Dekeyser, 2005:15). Certainly, there is a clear distinction in L1 Mandarin data between numeral + classifier NPs used for discourse new, non-inferable reference, and with bare forms used for discourse new, inferable reference, leaving a sufficiently *'transparent'* (Dekeyser, 2005:3) form/function relationship for

the L2 learner to acquire. However, we feel that given the difficulties encountered by L1 Korean speakers when acquiring bridging in L2 English (where, again, a clear distinction exists between indefinite and definite articles for non-bridging/bridging discourse-new reference), we are uncertain whether this distinction is the key to the relative ease of acquisition found in this study, especially considering that bare NPs are commonly used in discourse-old reference in Mandarin, as definite article NPs are in English.

It could also be the case that it is comparatively easier to acquire bridging in L2 Mandarin than L2 English, for example, given that Mandarin uses an unmarked form for bridging and the marked form (numeral + classifier NP) for non-bridging indefinite reference. This may be the case for both English and Korean/Japanese in that these languages mark bridging via either a complex article system (English) or have complex agglutinative inflectional referential systems generally (Korean / Japanese), making the L2 Mandarin form/function mapping appear relatively simplistic given that 'the more that needs to be expressed overtly, the more choices need to be made' (Dekeyser, 2005:6). Here, we can perhaps discount the potential claim that the L2 production of the bare nominal found in this study is in fact a developmental feature of the L2 varieties tested here, given that a more complex NP form is used for non-bridging indefinite reference (numeral + classifier NP) in L2 Mandarin, and which appears frequently and appropriately in the L2 data. If the bare nominal was taken to be a developmental feature of the L2 production, one might then reasonably assume that bare nominals would also be used in place of numeral + classifier NPs, but this does not appear to be the case from the L2 data in the present study. Rather, the L1 distinction between bridging = bare nominal and non-bridging introductions = numeral + classifier NP appears to be evidenced in the L2 production, at even this relatively early L2 proficiency level.

However, it appears as though cross-linguistic interference may be responsible for the differences noted in the results for RQ2 (effect of article vs article-less L1). Here, the findings of the study suggest significant effects of L1 background on the L2 Mandarin introduction of non-bridging and bridging relation reference. Specifically, L2 Mandarin learners from article-L1s appear to use the Mandarin numeral + classifier + noun construction as a *de facto* English-like indefinite article for non-bridging reference, and demonstrative + classifier + noun constructions as a *de facto* English-like definite article for bridging reference – reflecting their L1-like preference to explicitly mark bridging and non-bridging relations on the NP. In addition, L2 learners from article-less L1 backgrounds might well use a wider variety of forms in line with the L2 target, but also on occasion (just under 25% of the time) infelicitously use numeral + classifier NPs for bridging relation referents, suggesting neither an L1-like nor L2-target approach, but one in which numeral + classifier NPs are used to mark all types of discourse newness, whether bridging or non-bridging. Again, such evidence suggests that the L1 syntax-pragmatic configuration of marking bridging reference (alongside the well-established concerns regarding the cross-linguistic marking of [in]definiteness in general) causes considerable interference for our experimental groups during L2 acquisition. These findings are in line with the claims of Ellis (2006a, 2006b) in that those from article-L1s are (relatively) unable to prevent their L1 affecting how they perceive the cues of the syntax-pragmatic system of the L2, or that those from article-less L1s lack the ability to perceive the cues of the L2 target system, eventually resulting in the optionality seen in their L2 data.

A limitation of the study lies in the small sample size when comparing the number of participants from article-L1s to those from article-less L1s. Unfortunately, this limitation is tied to our learning context, in that there are very few L2 speakers of Mandarin from article-L1s attending

31

non-credit Mandarin courses in Hong Kong, and even fewer that would be of a higher proficiency than the learner group sampled in the present study. The Mandarin portion of the research team felt that the gap between the 'Level 4' learners sampled in this study and those in lower levels was also considerable and that students at lower levels would not be able to complete the narrative, knowing only a few basic 'survival' phrases and having very limited vocabulary. Such learners would be unlikely to create the conditions for a full range of bridging relations to be explored. While our statistical models passed goodness-of-fit tests even with our small sample, future research needs to consider 1) whether, and 2) when L2 Mandarin learners from article-L1s are able to overcome the effects of L1 transfer and produce the appropriate L2 target markings associated with bridging reference, if a good-sized sample of learners at higher L2 proficiencies can be sourced. Mai (2016) also suggests that current studies 'rarely go beyond late L2 Chinese learners who come to the classroom without prior exposure to Chinese and acquire the language through formal L2 instruction' (2016:137), and we are equally guilty in this regard. We are also aware that only one elicitation device was used, and that eye-tracking data or a self-paced reading task would help to triangulate the claims made from the narrative production data. We do not have access to eye-tracking hardware in our context, and as the proficiency of the students and focus of the L2 Mandarin course is on spoken language, our students are unable to read much (if any) Chinese script. Conversion to Romanised Pinyin is unlikely to be representative of how L1 Mandarin speakers perceive the referential system of their native language. Another potential limitation is that our participants could have some underlying knowledge of Cantonese from living in HK, although they did express otherwise. However, we feel that this is unlikely to have affected the results as a) the spoken form of Mandarin and Cantonese are not mutually intelligible, b) it is unlikely that these learners would

have much knowledge of the written form by this proficiency level, and c) the lingua franca for the L2 participants in HK is that of English rather than Cantonese. Analysis of the discourse-old reference used across L1-L2 groupings would also contribute to our claims regarding cross-linguistic influence and cue contingency, although as the focus of this paper is on discourse-new reference and due to space considerations, we accept that such an analysis should be performed in a follow-up paper. It would also be of interest to look at differences between L1/L2 pairs in terms of the marking bridging relation type, but the small sample size for particular relation types from our picture sequence rendered this analysis unsuitable. A corpus study of L2 Mandarin production would help to offset this concern, allowing for a greater frequency of all bridging relation types to be found in the data.

8. Conclusion

The present study has explored how speakers of article- and article-less L1s manage the production of discourse-new reference in bridging and non-bridging contexts. These findings have a number of implications for the SLA field. Firstly, it is apparent that more attention needs to be paid to studies of both Asian and non-Asian learners learning Asian languages if we are to document in more detail the specific phenomena that cause difficulties for L2 learners and how to overcome them as the importance of Asian languages spreads globally. Secondly, we have provided further evidence of L2 learnability issues related to cross-linguistic influence and acquiring language at the syntax-pragmatic interface. The L2 learners in our study were generally successful at producing target-like reference between bridging and non-bridging reference, and fared relatively better in the production of target-like bridging reference than L2 English learners from article-less backgrounds as reported in previous studies. However, we have clearly identified both predictable cross-linguistic effects as well as L2-specific difficulties

encountered by L2 learners of Mandarin, and that are unique to the study of Mandarin as a second language. The findings again suggest (as with previous research) that Mandarin itself may be a special case among so-called article-less languages in terms of the encoding of definiteness generally and bridging relations in particular, and that learners of L2 Mandarin need to be made more fully aware of the syntax-pragmatic differences between their L1 and L2 target.
