## JAVASCRIPT BASICS

Leslie Carr
COMP3001

## JavaScript

It's a bit like Java

## Java in a web page

- Java sandbox only has control of an area of the screen
- Java program interacts with user through that visible area
- No interaction with surrounding web page

## JavaScript in a web page

blah blah blah blah blah $\bullet f o o$ blah blah blah blah bar blah blah blah blah blah blah blah<br>- blah blah<br>blah blah blah blah blah blah

- JavaScript has access to whole Web page contents and browser window
- JavaScript program interacts with user through the web page

## JavaScript paradigm (1)

- The Web page just consists of JavaScript commands
- The commands create the web page contents

## JavaScript paradigm (2)

blah blah blah<br>blah blah blah<br>blah blah blah<br>blah blah blah<br>blah blah blah

Date: Wed 15th Nov 2006

- The Web page contains some JavaScript commands inside the text
- The commands create part of the web page contents

## JavaScript paradigm (3)

function start() $\}$ function clicked() $\}$
<body onLoad="start()"> blah blah blah
<p onClick="clicked()">
blah blah blah </p>
blah blah blah blah blah blah </body>

- The Web page contains some JavaScript function definitions
- The HTML refers to these functions in its event handler markup
- HTML controls when the interaction takes place, but JavaScript controls what happens

## Java: Principle Differences

- No sandbox
- Less bondage programming
- Dynamic typing, not static
- No typed variable declarations
- Because the programming scope is limited
- Objects / methods very similar
- Especially Strings
- No classes

## JavaScript: learning the language

- This is where you RTFM
- This is also where you try it out
- This is also where you look at examples
- See the unit web page for all the above
