7

8 Nine new (+)-dehydroabietylimidazolium salts were synthesised and studied as chiral solvating agents for a number of different 9 racemic aromatic and nonaromatic carboxylate salts. These cationic chiral solvating agents resolve racemic ionic analytes better 10 than non-ionic ones. Bis(dehydroabietylimidazolium) bis(trifluoromethanesulfonimide) gave the best discrimination for the 11 enantiomers of carboxylate salts. Its resolution behaviour was studied by an NMR titration experiment, which indicated 1:1 12 complexation with the racemic analyte. The dehydroabietylimidazolium salts were also useful in enantiomeric excess (ee) 13 determinations, and for the recognition of chirality of racemic aromatic and non-aromatic α -substituted carboxylic acids.

14 Introduction

15 The determination of enantiomeric purity is an important aspect of synthetic chemistry and various methods have been developed 16 for this purpose. Compared to commonly used techniques (*e.g.*, HPLC), the determination of enantiomeric purity by NMR 17 spectroscopy has been less frequently used as a tool in synthesis monitoring. Due to the development of higher field instruments, 18 NMR spectroscopy has become more sensitive,¹ and the enantiomeric excess (*ee*) may be determined up to a 94-99% level.² This 19 allows reliable, accurate and expedient *ee* determinations³ required particularly in pharmaceuticals development. Minimal sample 20 preparation, ease of use and fast analyses make NMR spectroscopy an optimal tool for quick *ee* determinations.

The NMR spectra of enantiomers are indistinguishable as their chemical environments are identical. To differentiate the enantiomers, a diastereomeric environment is required. This can be created by using chiral auxiliary compounds such as chiral solvating agents, paramagnetic chiral shift reagents, chiral liquid crystals, or chiral derivatising agents.^{4,5} Chiral solvating agents are most often employed due to their ease of use. Both neutral and ionic chiral solvating agents have been developed, although the latter have gathered less attention.^{4,5}

26 The use of chiral solvating agents is based on the complexation between the chiral solvating agent (host) and the two enantiomers 27 of the chiral substrate (guest), to generate two diastereomeric 'complexes'.^{4,5} Complexation between a host and guest depends on 28 interactions such as hydrogen bonding, π - π stacking and ion-ion interactions.⁵ Aromatic moieties in chiral solvating agents can 29 enable $\pi - \pi$ stacking but, more importantly, they can also provide shielding which increases resolution.^{4,6} Therefore most of the 30 chiral solvating agents developed are aromatic and they can be used for both aromatic and non-aromatic chiral compounds.⁷ 31 Electronegative groups and hydrogen donor and/or acceptor groups are able to provide the needed interaction to create a host-guest 32 complex.^{4,5} Bulky substituents are also useful, as they can obstruct complex formation for the other enantiomer, thus increasing the 33 chemical shift difference.¹ In the case of an ionic chiral solvating agent, the counter ion will also have an effect on the degree of 34 resolution. Counter ions with a delocalised charge are often favoured as they have been observed to increase resolution.⁸

35 Our aim was to develop and investigate new ionic chiral solvating agents, as they have not been widely studied. The resin 36 derivative (+)-dehydroabietylamine is known to have an enantiomeric recognition ability towards chiral carboxylic acids9 but, 37 apart from recent work from our group,^{10,11} (+)-dehydroabietylamine has not been used as a chiral solvating agent. As it is readily 38 available, derived from renewable resources at a low cost, has a bulky structure, and contains both an aromatic moiety and an 39 amine group that may also be converted to the cationic form, it should provide an ideal starting material for cationic chiral 40 solvating agents. Although some cationic chiral solvating agents have been reported, their resolution ability has been scantily 41 studied. In most cases, the developed chiral solvating agents have only been tested with one guest.¹² A lack of comparison with a 42 number of compounds hinders the establishment of the full potential of a developed chiral solvating agent in enantiomeric 43 resolutions. The resolution ability of newly developed cationic chiral solvating agents has been more extensively investigated in a 44 few cases only,^{10,13} predominantly with racemic aromatic carboxylic acids.^{10,12-14} The favoured test compound has been Mosher's acid (3,3,3-trifluoro-2-methoxy-2-phenylpropanoic acid), used either as such¹⁴ or in its anionic¹² form. 45

Here, ten different (+)-dehydroabietylimidazolium or (+)-dehydroabietylimidazolinium chiral solvating agents were prepared (Scheme 1). Their effectiveness as chiral discriminators was extensively investigated, along with the effect of the anion on the resolution, the effect of the aromatic functionality, and the question as to whether it is better for the guest to be neutral or anionic. The enantiomeric resolution of neutral guests by ionic chiral solvating agents has rarely been studied, and when the guest is a carboxylic acid, it has usually been converted to the anion.¹⁰⁻¹³ Mosher's acid was used as a test compound as it enables detection by both ¹H and ¹⁹F NMR spectroscopy. In order to carry out a systematic study, the best performing chiral solvating agent was

- 52 used in the resolution of seven different carboxylate salts, to establish its applicability in resolving both aromatic and non-aromatic
- 53 racemic carboxylic acids.
- 54

56 Scheme 1. Synthesis of (+)-dehydroabietylimidazole (1a), and (+)-dehydroabietylimidazolium (1b, 2, and 4) and (+)-57 dehydroabietylimidazolinium (3) salts.

58 Experimental

59 General

All reagents and solvents were obtained from commercial suppliers (Sigma Aldrich) and were used without further purification
unless otherwise stated. (+)-Dehydrobietylamine was purchased as 60% grade (Sigma-Aldrich) and purified by a method described
in the literature¹⁵ with slight modifications (see below). Flash chromatography was performed on 40-63 mesh silica gel.
Microwave syntheses were performed using the CEM Focused MicrowaveTM Synthesis System (Model Discover). Melting points
were determined on a digital melting point apparatus (Büchi B 545). Optical rotations were determined on a digital polarimeter
(JASCO DIP-1000) at 22 °C in trichloromethane as solvent. The exact mass measurements were performed by high-resolution
mass spectrometry (Brucker MicroTOF LC) with electrospray ionisation (ESI).

67 Compound characterisation

68 NMR experiments were performed using Varian UNITY INOVA 500 and Varian Mercury Plus 300 instruments at 27 °C. ¹H 69 NMR spectra were recorded with 4-16 transients, 4085-8000 Hz spectral width, and 1.9 s acquisition time at 500 MHz. ¹³C NMR 70 spectra were recorded with 576-1500 transients, 20000-31446 Hz spectral width and 1.8 s acquisition time at 125 or 75 MHz. ¹⁹F 71 NMR spectra were recorded with 16-32 transients, 19047 Hz spectral width, 5.0 s relaxation delay and 1.0 s acquisition time at 72 470 MHz. All 2D HSQC spectra (see supporting information) were recorded using the Varian UNITY INOVA 500 instrument 73 with 4 transients, 128-300 increments, 8000-4085 Hz spectral widths in ¹H-dimension, 22955-31446 Hz spectral widths in ¹³C-74 dimension, 1.0-2.0 s relaxation delays, and 0.128 s acquisition time. TMS was used as the reference compound in NMR 75 measurements. Chemical shift scale of ¹⁹F was fixed by applying absolute, indirect referencing by calculating the frequency 76 position for 0.0 ppm in ¹⁹F chemical shift scale from the ¹H chemical shift scale. To differentiate the proton and carbon signals of 77 aromatic and imidazolium and 2-imidazolinium structures, subscript Ar (CHAr) is used for aromatic and im (CHim) for 78 imidazolium and 2-imidazolinium.

80 Preparations

79

Purification of (+)-dehydroabietylamine Crude 60 % (+)-dehydroabietylamine (42.0 g) was dissolved in toluene (70.0 cm³) and
 ethanoic acid (9.65 g) in toluene (30.0 cm³) was slowly added. The salt was left to crystallise in the refrigerator. The product was

- 83 collected by filtration and washed with hexane (30.0 cm³). (+)-Dehydroabietylamine ethanoate was recrystallised from methanol. 84 (+)-Dehydroabietylamine ethanoate (21.0 g) was dissolved in hot water and 10% aqueous NaOH solution (28.0 cm³) was added. 85 (+)-Dehydroabietylamine was extracted with diethyl ether (50.0 cm³) and the organic phase was washed with water until neutral, 86 and then dried over anhydrous sodium sulfate. The solvent was evaporated, and the resultant (+)-dehydroabietylamine was dried 87 under vacuum to yield a white solid; yield 37.0 g, 88.2%; m.p. 44.2 °C (lit. 44-45 °C)¹⁶; $[\alpha]^{22}$ +44.3480 (c = 10.0 mg/cm³, 88 CHCl₃); ¹H NMR (500 MHz, CDCl₃) δ/ ppm 0.89 (s, 3H, CH₃), 1.22 (s, 3H, CH₃), 1.22 (d, *J* = 7.0 Hz, 6H, 2×CH₃), 1.33 (m, 2H, 89 CH₂), 1.39 (m, 1H, CHH), 1.52 (dd, J = -11.8, 3.3 Hz, 1H, CH), 1.69 (m, 2H, CH₂), 1.74 (m, 2H, CH₂), 2.30 (dt, J = -13.1, 1.7 Hz, 90 1H, CHH), 2.40 (d, J=-13.5 Hz, 1H, CHH), 2.61 (d, J=-13.5 Hz, 1H, CHH), 2.82 (sep. J = 7.0 Hz, CH), 2.88 (m, 2H, CH₂), 6.89 91 (d, J = 1.9 Hz, 1H, CH_{Ar}), 7.00 (dd, J = 8.1, 1.9 Hz, 1H, CH_{Ar}), 7.18 (d, J = 8.1 Hz, 1H, CH_{Ar}); ¹³C NMR (500 MHz, CDCl₃) δ 92 ppm 18.78 (CH2), 18.90 (CH3), 18.90 (CH2), 24.11 (CH3), 24.13 (CH3), 25.37 (CH3), 30.31 (CH2), 33.58 (CH), 35.36 (CH2), 37.36 93 (C), 37.53 (C), 38.70 (CH2), 45.00 (CH), 53.99 (CH2), 123.96 (CHAr), 124.38 (CHAr), 126.94 (CHAr), 134.84 (CAr), 145.67 (CAr), 94 147.63 (C_{Ar}); HRMS-ESI (m/z) calc. for C₂₀H₃₂N [M + H]⁺ 286.2529, found 286.2540.
- 95 Synthesis of 1-dehydroabietylimidazole (1a) (+)-Dehydroabietylamine (5.0 g, 17.54 mmol, 1.0 eq) was dissolved in 2-propanol 96 (10.0 cm³) and 25% aqueous ammonium hydroxide solution (2.70 cm³, 17.54 mmol, 1.0 eq) was added. A mixture of a 40% 97 aqueous solution of glyoxal (2.17 cm³, 18.94 mmol, 1.08 eq) and 35% aqueous solution of formaldehyde (1.49 cm³, 18.94 mmol, 98 1.08 eq) in 2-propanol (20.0 cm³) was added dropwise to the reaction mixture which was kept at 80 °C for 4 h and left to stir at 99 room temperature overnight. Water (20.0 cm³) was added to the reaction mixture, which was then extracted with diethyl ether 100 (40.0 cm³). The organic phase was washed with water until neutral and dried over anhydrous magnesium sulfate. The organic 101 phase was filtered and the solvent evaporated; the crude product was dried under vacuum, and recrystallised from a diethyl ether-102 pentane mixture. Yield 2.5 g, 41.7%; white solid; m.p. 107.6 °C; $[\alpha]^{22}$ D -25.9560 (c = 10.0 mg/cm³, CHCl₃); ¹H NMR (500 MHz, 103 CDCl₃) δ/ppm 1.00 (s, 3H, CH₃), 1.21 (d, J = 6.92 Hz, 6H, 2×CH₃), 1.23 (s, 3H, CH₃), 1.28 (m, 1H, CHH), 1.33 (m, 1H, CHH), 104 1.35 (m, 1H, CH), 1.38 (m, 1H, CHH), 1.70 (m, 2H, CH₂), 1.87 (m, 2H, CH₂), 2.25 (dt, J = -13.1, 3.5 Hz, 1H, CHH), 2.81 (sep. J 105 = 6.9 Hz, CH), 2.89 (m, 1H, CHH), 2.96 (ddd, J = -16.9, 6.7, 2.4 Hz, 1H, CHH), 3.70 (d, J = -14.0 Hz, 1H, CHH), 3.86 (d, J = -106 14.0 Hz, 1H, CHH), 6.83 (t, J = 1.1 Hz, 1H, CHim), 6.88 (d, J = 2.1 Hz, 1H, CHAr), 6.97 (dd, J = 8.3, 2.1 Hz, 1H, CHAr), 6.99 (t, J 107 = 1.1 Hz, 1H, CH_{im}), 7.12 (d, J = 8.3 Hz, 1H, CH_{Ar}), 7.38 (t, J = 1.1 Hz, 1H, CH_{im}); ¹³C NMR (500 MHz, CDCl₃) δ ppm 18.59 108 (CH₂), 18.77 (CH₃), 19.40 (CH₂), 24.07 (CH₃), 24.09 (CH₃), 25.69 (CH₃), 29.94 (CH₂), 33.56 (CH), 36.72 (CH₂), 37.68 (C), 38.08 109 (C), 38.13 (CH2), 45.06 (CH), 58.45 (CH2), 121.12 (CHim), 124.12 (CHAr), 124.23 (CHAr), 126.97 (CHAr), 128.81 (CHim), 134.19 (C_{Ar}) , 138.73 (C_{Him}), 145.90 (C_{Ar}), 146.84 (C_{Ar}); HRMS-ESI (m/z) calc. for C₂₃H₃₃N₂ [M + H]⁺ 337.2638, found 337.2635. 110
- 111 Synthesis of 1-(+)-dehydroabietylimidazolium bis{(trifluoromethyl)sulfonyl}amide) (1b). Bistriflamidic acid (80 mg, 2.97 112 mM, 1.0 eq) was added to compound 1a (0.10 g, 2.97 mmol, 1.0 eq) in dichloromethane (0.5 cm³) at 0 °C. After stirring the 113 reaction mixture for 1 h at room temperature, water (3.0 cm³) was added, two layers separated, and the organic phase was washed 114 with water (3×2.0 cm³). The organic solvent was evaporated and product dried in vacuum. Yield 0.18 g, 96.8%; amorphous solid 115 at room temperature; $[\alpha]^{22}$ D -23.2360 (c = 10.0 mg/cm³, CHCl₃); ¹H NMR (500 MHz, CDCl₃) δ /ppm 1.05 (s, 3H, CH₃), 1.21 (d, J 116 = 7.0 Hz, 6H, $2 \times CH_3$, 1.24 (s, 3H, CH₃), 1.25 (m, 1H, CHH), 1.29 (m, 1H, CH), 1.31 (m, 1H, CHH), 1.41 (dt, J = -12.6, 2.9 Hz, 117 1H, CHH), 1.72 (m, 2H, CH₂), 1.89 (m, 2H, CH₂), 2.31 (dt, J = -12.7, 3.2 Hz, 1H, CHH), 2.82 (sep. J = 7.0 Hz, CH), 2.87 (m, 1H, 118 CHH), 3.01 (ddd, J = -17.8, 8.4, 2.2 Hz, 1H, CHH), 4.06 (d, J = -14.3 Hz, 1H, CHH), 4.06 (d, J = -14.3 Hz, 1H, CHH), 6.90 (d, 119 J= 1.9 Hz, 1H, CH_{Ar}), 6.99 (dd, J= 8.1, 1.9 Hz, 1H, CH_{Ar}), 7.13 (d, J = 8.1 Hz, 1H, CH_{Ar}), 7.14 (t, J = 1.5 Hz, 1H, CH_{im}), 7.33 (t, J 120 = 1.5 Hz, 1H, CH_{im}), 8.40 (t, J = 1.5 Hz, 1H, CH_{im}); ¹³C NMR (500 MHz, CDCl₃) δ/ ppm 18.22 (CH₃), 18.31 (CH₂), 19.32 (CH₂), 121 24.03 (CH₃), 24.08 (CH₃), 25.57 (CH₃), 29.69 (CH₂), 33.57 (CH), 36.59 (CH₂), 37.76 (C), 37.97 (CH₂), 38.08 (C), 45.62 (CH), 122 60.92 (CH₂), 119.82 (q, J = 320.8, CF₃), 120.67 (CH_{im}), 123.28 (CH_{im}), 124.14 (CH_Ar), 124.33 (CH_Ar), 127.10 (CH_Ar), 133.90 123 (CAr), 136.04 (CHim), 146.23 (CAr), 146.36 (CAr); HRMS-ESI (m/z) calc. for [C23H33N2]⁺ [M]⁺ 337.2638, found 337.2630, calc. for 124 [C₂F₆NO₄S₂]⁻ 279.9167, found 279.9177.
- 125 Synthesis of 1,3-bisdehydroabietylimidazolium chloride (2a) Formaldehyde (35% aqueous solution; 0.14 cm³, 1.75 mmol, 1.0 126 eq) was added dropwise to (+)-dehydroabietylamine (1.0 g, 3.51 mmol, 2.0 eq) in toluene (10.0 cm³) at 0 °C and the reaction mixture was allowed to warm to room temperature. A mixture of aqueous hydrochloric acid (35%; 0.16 cm³, 1.75 mmol, 1.0 eq) 127 128 and 40% glyoxal (0.20 cm³, 1.75 mmol, 1.0 eq) was added dropwise to the reaction mixture at 0 °C which was allowed warm to 129 room temperature, and then heated for 24 h at 80 °C. The solvent was removed by evaporation and the crude product dried under 130 vacuum, purified by column chromatography (1:9 methanol:CH₂Cl₂), and crystallised from a CH₂Cl₂:EtO₂CMe mixture. Yield 131 0.73 g, 64.5%; white solid; m.p. 220.5 °C; $[\alpha]^{20}_{D}$ -66.4120 (c = 10.0 mg/cm³, CHCl₃); ¹H NMR (500 MHz, CDCl₃) δ / ppm 1.03 (s, 132 6H, 2×CH₃), 1.11 (m, 2H, 2×CHH), 1.15 (m, 2H, 2×CHH), 1.19 (s, 6H, 2×CH₃), 1.21 (d, *J* = 6.9 Hz, 12H, 4×CH₃), 1.24 (m, 2H, 133 2×CH), 1.43 (dt, J = -12.7, 2.8 Hz, 2H, 2×CHH), 1.53 (m, 2H, 2×CHH), 1.62 (m, 2H, 2×CHH), 1.88 (m, 2H, 2×CHH), 2.05 (m, 134 135 17.4, 6.7 Hz, 2H, 2×CHH), 4.13 (d, J = -14.0 Hz, 2H, 2×CHH), 4.37 (d, J = -14.0 Hz, 2H, 2×CHH), 6.89 (d, J = 1.9 Hz, 2H, 136 2×CH_{Ar}), 6.96 (dd, J = 8.2, 1.9 Hz, 2H, 2×CH_{Ar}), 7.07 (d, J = 8.2 Hz, 2H, 2×CH_{Ar}), 7.11 (s, 2H, 2×CH_{im}), 10.78 (s, 1H, CH_{im}); ¹³C 137 NMR (500 MHz, CDCl₃) δ/ ppm 18.22 (2×CH₃), 18.42 (2×CH₂), 19.22 (2×CH₂), 24.04 (2×CH₃), 24.08 (2×CH₃), 25.50 (2×CH₃), 138 29.72 (2×CH₂), 33.53 (2×CH), 36.61 (2×CH₂), 37.65 (2×C), 37.97 (2×CH₂), 38.19 (2×C), 45.43 (2×CH), 60.50 (2×CH₂), 122.75

139 $(2 \times CH_{im})$, 124.03 $(2 \times CH_{Ar})$, 124.09 $(2 \times CH_{Ar})$, 126.98 $(2 \times CH_{Ar})$, 134.09 $(2 \times C_{Ar})$, 140.99 (CH_{im}) , 146.00 $(2 \times C_{Ar})$, 146.51 $(2 \times C_{Ar})$; 140 HRMS-ESI (m/z) calc. for $[C_{43}H_{61}N_2]^+$ [M]⁺ 605.4829, found 605.4824.

141 Synthesis of *N*,*N*'-bisdehydroabietyl-1,2-diaminoethane (+)-Dehydroabietylamine (1.0 g, 3.51 mmol, 2.0 eq), 142 1,2-dibromoethane (0.15 cm³, 1.75 mmol, 1.0 eq) and Na₂CO₃ (0.18 g, 1.75 mmol, 1.0 eq) were added to a microwave tube with 143 2-propanol. The reaction mixture was microwave irradiated (110 W, at 110 °C) for 2 h. The solvent was evaporated and the solid 144 triturated with diethyl ether, collected by filtration, and then mixed with diethyl ether (20.0 cm³) and aqueous sodium hydroxide 145 (2.0 M, 10.0 cm³). The organic phase was washed with water until neutral and dried over anhydrous sodium sulfate. The organic 146 phase was filtered and the solvent evaporated. The solid product was dried under vacuum and purified by flash chromatography 147 (1:9 MeOH:DCM CH₂Cl₂). Yield 0.78 g 74.3%; white solid; m.p. 63.8 °C; $[\alpha]^{22}D$ +43.3160 (c = 10.0 mg/cm³, CHCl₃); ¹H NMR 148 (500 MHz, CDCl₃) δ/ ppm 0.91 (s, 6H, 2×CH₃), 1.20 (s, 6H, 2×CH₃), 1.23 (d, *J* = 7.0 Hz, 12H, 4×CH₃), 1.37 (m, 2H, 2×CHH), 149 1.38 (m, 4H, 2×CH₂), 1.57 (dd, J = -12.3, 2.7 Hz, 2H, 2×CH), 1.60 (m, 4H, 2×CH₂), 1.71 (m, 2H, 2×CHH), 1.75 (m, 2H, 2×CHH), 150 2.23 (dt, J = -12.8, 3.3 Hz, 2H, 2×CHH), 2.32 (d, J = -11.8 Hz, 2H, 2×CHH), 2.51 (d, J = -11.8 Hz, 2H, 2×CHH), 2.70 (s, 4H, 151 152 2×CH_{Ar}), 7.16 (d, J = 8.1 Hz, 2H, 2×CH_{Ar}); ¹³C NMR (500 MHz, CDCl₃) δ/ ppm 18.98 (4×CH₂), 19.35 (2×CH₃), 24.14 (4×CH₃), 153 25.47 (2×CH₃), 30.46 (2×CH₂), 33.58 (2×CH), 36.39 (2×CH₂), 37.18 (2×C), 37.55 (2×C), 38.58 (2×CH₂), 45.62 (2×CH), 50.02 154 (2×CH₂), 61.61 (2×CH₂), 123.91 (2×CH_Ar), 124.41 (2×CH_Ar), 126.89 (2×CH_Ar), 134.88 (C_Ar), 145.54 (2×C_Ar), 147.64 (2×C_Ar); 155 HRMS-ESI (m/z) calc. for C₄₂H₆₅N₂ [M + H]⁺ 597.5142, found 597.5132.

156 Synthesis of 1,3-bisdehydroabietyl-2-dihydroimidazolinium tetrafluoroborate (3a) A microwave tube was loaded with N,N'-157 bisdehydroabietyl-1,2-diaminoethane (0.5 g, 0.84 mmol, 1.0 eq), triethylorthoformate (0.14 cm³, 0.84 mmol, 1.0 eq), ammonium 158 tetrafluoroborate (88 mg, 0.84 mmol, 1.0 eq) and 2-propanol (1.0 cm³). The reaction mixture was irradiated (140 W, at 110 °C) for 159 40 min. The solvent was removed by evaporation and diethyl ether (5.0 cm³) was added. The mixture was then filtered and the 160 resultant solid dried under reduced pressure followed by recrystallisation from a methanol-ethanenitrile mixture. 185 Synthesis of guests

N-Acetylation of phenylalanine was performed according to literature.¹⁷ Preparation of tetrabutylammonium salts of acids was
 performed by adding tetrabutylammonium hydroxide (1.0 M in methanol, 1.0 eq) to the racemic acid (1.0 eq) in methanol. After
 stirring for 3 h, the solvent was removed by evaporation and the product was dried in vacuum.

189

184

190 General procedure for anion exchange

191 Anion exchange reactions were performed according to literature.^{14a} Li[NTf₂] or ammonium tetrafluoroborate solution (1.0 M, 1.0

eq) was added to the chiral solvating agent (1.0 eq, in dichloromethane) at room temperature and stirred for 1 h. The phases were separated by gravity and the organic phase was washed with water $(3 \times 10 \text{ cm}^3)$. The organic phase was concentrated and dried under vacuum.

252 Results and discussion

253 The syntheses of (+)-1-dehydroabietylimidazole (1a) and the nine derived imidazolium salts (1b-4c) were performed as shown in 254 Scheme 1. To obtain 1a, (+)-dehydroabietylamine was treated with aqueous NH₃, glyoxal and aqueous formaldehyde in 255 2-propanol at 80 °C (41%). The salt 1b was formed (96%) from 1a by reaction with HNTf2 in CH2Cl2 at 0 °C. Compound 2a was 256 obtained from (+)-dehydroabietylamine, glyoxal, aqueous formaldehyde and aqueous hydrochloric acid (64%) in toluene. 3a was 257 prepared via N,N'-bisdehydroabietyl-1,2-diaminoethane, in a one-pot reaction from (+)-dehydroabietylamine, 1,2-dibromoethane 258 and Na₂CO₃ in 2-propanol with microwave heating (74%), followed by the addition of CH(OEt)₃ and [NH₄][BF₄] in 2-propanol 259 (66%). For improved shielding ability, 1a was quaternised with benzyl bromide under microwave irradiation to give 4a. It is 260 known that more delocalised and bulky anions generally enhance binding between the cationic chiral solvating agent and (ionic or 261 molecular) chiral substrate due to weaker binding between the cation and anion of chiral solvating agent.⁸ To tune the binding 262 properties of 2a, 3a and 4a, anion exchange was performed with [NH4][BF4] and Li[NTf2] to obtain 2b-c, 3b and 4b-c in high 263 yield. The delocalisation and increased size of the anion also affect the physical properties of the ionic chiral solvating agents.⁸ For 264 instance, the melting points of 4a, 4b and 4c decrease when the bulkiness and delocalisation of anion increase (m.p. of $Br > [BF_4]$ 265 $> [NTf_2]).$

266 The chiral discrimination of racemic carboxylic acids and their respective carboxylate anions by (+)-1-dehydroabietylimidazole 267 (1a) and its imidazolium salt derivatives (1b-4c) was examined with Mosher's acid [5; $F_3CC(OCH_3)(Ph)COOH$] and its 268 tetrabutylammonium ($[N_{4444}]^+$) salt (6). The effect of the concentration of the chiral solvating agent was also investigated, since it 269 is known that higher concentrations generally enhance the enantiomeric resolution between R and S enantiomers $(\Delta \partial)^{4,5}$ Since 270 polar solvents can dissolve salts, and protic solvents may interfere in hydrogen bond formation,^{13a} CDCl₃ was chosen as a solvent 271 for the NMR studies, performed by dissolving the chiral solvating agent (1.0 or 2.0 eq) in a stock solution containing 5 or 6 (0.5 272 cm³; 1.0 eq, 22.0 mM). According to the results obtained from the NMR experiments (Table 1 and Fig. 1), the chiral solvating 273 agents 1b-4c resolved the enantiomers of 6 very efficiently (11.4-49.9 Hz). The best results were obtained with 2c (0.11 ppm, 49.8 274 Hz). Also the enantiomers of 5 were resolved, but with a $\Delta\delta$ less than that with 6. Only 1a gave notably better discrimination for 5 275 (19.3 Hz) compared to **1b-4c** (0.88-7.0 Hz). This indicates that resolution using **1b-4c** is highly dependent on the ionic nature of 276 the guest and vice versa in the case of 5. Although ionic hosts (1b-3b and 4c) were able to discriminate 5, the neutral 1a failed to 277 discriminate 6, making the ionic chiral solvating agents more versatile than a neutral one as the former also discriminate neutral 278 species. For 6 and 5, $\Delta\delta$ was found to be larger in the ¹⁹F NMR spectra than in the ¹H NMR spectra. The ionic **1b-4c** gave larger 279 resolutions in ¹H NMR spectra in the case of 5 compared to 6. This may be due to a different host-guest complex structure formed 280 between the neutral guest and the ionic host, compared to situation when both are ionic. The increase of chiral solvating agent 281 concentration to 2.0 eq. did not cause a significant increase in $\Delta\delta$ (~ 0.0-8.0 Hz). Also, in some cases (1b, 2c, 3b and 4c), the 282 resolution was decreased due to an increased host concentration. 283

Table 1. The ¹H and ¹⁹F NMR chemical shift differences ($\Delta \delta$) between the *R* and *S* enantiomers of racemic Mosher's acid (5) and its tetrabutylammonium salt (6) in the presence of various (+)-dehydroabietylimidazole chiral solvating agents (500 MHz) in CDCl₃ at 27 °C.

Figure 1. NMR spectra [1 H (OCH₃) and 19 F (CF₃)] of 5 (A) and 6 (B) from the resolution of enantiomers with chiral solvating agents 1a-4c in 1:1 and 2:1 host:guest ratio.

To determine which features affect the resolution of **5** and **6** by an ionic host (**1b-4c**), the effect of the structure of the cation and its counter anion were examined. The discrimination of enantiomers of **6** was enhanced by a bulky chiral substituent on the imidazolium N-3, an aromatic ionic unit and an anion with a more delocalised charge ($[NTf_2]^- vs. Cl^-$). In the case of **5**, resolution was enhanced by a bulky substituent at the N-3 site, a non-aromatic ionic unit and an anion with a more localised charge ($[Cl^- vs. Cl^-)$). For example, **1b**, lacking a substituent at N-3, resolves the enantiomers of **6** less efficiently than **4c**, which has a benzyl

287

group as the N-3 substituent. This indicates that the presence and nature of an imidazolium N-3 substituent is important for the resolution. When comparing **4a-c** with **3a,b** and **2a-c**, where the imidazolium nucleus carries two (+)-dehydroabietyl groups, the discrimination is distinctly improved. An additional contribution to binding comes from hydrophobic and π - π stacking effects due to the substituents on the imidazolium unit. This can be seen from the simplified models in Figure 2, illustrating a tentative complex structure. On comparing **3a,b** and **2a-c**, it is clearly seen that the aromaticity of the ionic centre has a beneficial influence on $\Delta\delta$ (*e.g.* **2c** *vs* **3b**). Similar behaviour was noted with **5**, and also in this case a bulky side chain at N-3 enhanced the resolution. The non-aromatic ionic centre (**3a**, 7.0 Hz) was noted to give a better resolution for **5** than for an aromatic one (**2a-2c**, 1.0-5.0 Hz).

No explicit counter anion effects on the discrimination of molecular guests could be seen. In a 1:1 stoichiometry, $[NTf_2]^-$ (2c, 304 3b and 4c) gave the best resolution, as non-hydrogen-bonding anions (such as $[NTf_2]^-$) allow bonding between the host and the 305 carboxylate to occur more efficiently due to its 'loose' association with the host cation. However, when the concentration was 306 increased, $[BF_4]^-$ gave slightly better results in the case of 3a and 4a. This phenomenon may be due to aggregation between the 307 host and guest due to the increased concentration of host. In the case of 5, the effect of a counter anion was also noted, although in 308 this case the delocalisation of charge in the anion did not seem to increase resolution. An anion with a more localised charge 309 favoured resolution, and among those the size of anion (Cl⁻ vs. $[BF_4]^-$) seemed to play a crucial role.

310 As 2c gave the best resolution (49.9 Hz), its enantiomeric discrimination power was further investigated by titration to find the 311 optimum conditions for complexation. It is important to establish the structure of the complex in order to evaluate how much chiral 312 solvating agent will be needed for optimal resolution. It also helps to evaluate if it is practical to increase the amount of host over 313 the stoichiometric amount. A guest solution of 6 (0.5 cm³, 2.0 mM) was measured into an NMR tube and titrated with 0.5 mm³ 314 doses of a host solution of 2c (46.6 mM). Figures 3A and 4 show the chemical shifts of S and R enantiomers as a function of host 315 concentration. Also, the change in the chemical shifts of enantiomers was determined (Fig. 3B) from the titration experiment. The 316 $\Delta\delta$ was not large enough in ¹H NMR spectra (Fig. 4) for a reliable indication of complexation and only data from ¹⁹F NMR spectra 317 were used. The $\Delta\delta$ change between S and R enantiomers as a function of host concentration (Fig 3C) suggest that maximal 318 resolution is obtained when the concentrations of host and guest are the same (2.0 mM, 1.0 eq), corresponding to a 1:1 319 complexation. Also a Job's plot¹⁸ based on data obtained from a titration experiment (Fig. 3D) confirmed the 1:1 complex 320 stoichiometry.

Figure 3. (A) The chemical shifts of S (+) and R (Δ) enantiomers of **6** (c = 2.0 mM); (B) the change of chemical shift of R and Senantiomers of **6**; (C) $\Delta\delta$ between R and S enantiomers of **6** as a function of concentration of **2c**; (D) Job's plot ([H] = the concentration of host, [G] = the concentration of guest).

Figure 4. The change of chemical shift of R and S enantiomers of 6 in (A) the ¹H NMR spectra, and (B) the ¹⁹F NMR spectra.

Figure 5. Correlation between theoretical and practical ee% values of enantiomerically enriched samples of 6 (2c used as chiral solvating agent), by ¹⁹F NMR spectroscopy (470 MHz, CDCl₃, 27 °C). Measured values are based on the peak areas from line fitting of the CF₃ peak.

The applicability of 2c in *ee* measurements by NMR spectroscopy was investigated employing a solution of racemic **6** and enantiomerically pure *S*-**6** (2.0 mM). Mixtures of enantiomerically enriched samples were prepared in an NMR tube (0.5 cm³, 1.0 eq.) and 2c (22.5 mm³, 46.6 mM, 1.0 eq.) was added. The determined ee% values are in line with the expected values (Fig. 5), showing that 2c can be reliably used in *ee* determinations.

341 To obtain more information about the resolution behaviour of 2c, its ability to discriminate enantiomers of various α -substituted 342 racemic carboxylic acids was studied. Acids were converted to their tetrabutylammonium salts, as 2c showed better resolution 343 towards ionic species, due to stronger interactions through ionic and hydrogen bonding. The experiments were performed by 344 adding a solution of 2c (46.6 mM, 22.5 cm³, 1.0 eq.) to a solution of the guest (2.0 mM, 0.5 cm³, 1.0 eq.). The results indicate 345 (Table 2) that **2c** can resolve both aromatic and non-aromatic α -substituted carboxylic acids. The best resolution was obtained 346 with 11 but no essential differences between the $\Delta\delta$ values of 7-10, 12 and 13 were detected. This is in contrast to previous 347 study^{7a} suggesting that the presence of an aromatic ring (in the carboxylic acid) is necessary for good signal separation. In 348 addition, 2c not only resolved the proton at the chiral centre of 7, but also the prochiral CH₂ and isopropyl groups. Such long 349 range effects are rare since usually only the nuclei close to the chiral centre and the nuclei adjacent to the site of association of 350 the chiral reagent can be resolved.¹ The long range effect may indicate the asymmetric shape of the *pseudo*-cavity present in the 351 host (Fig. 2). According to the results, 2c efficiently resolves chiral carboxylic acids with a large polar group at the α -position (e.g. 352 11) or those with a crowded α -position (*e.g.* 6). Although the peaks of 7-10, 12 and 13 were not properly baseline resolved ($\Delta\delta$ 353 2.3-4.8 Hz), the determinations of ee could still be feasible with special techniques. For instance, the recently published pure 354 shift experiments,^{19,20} or J-resolved²¹, RES-TOCSY^{22,10c} and ¹H homonuclear decoupling experiment (HOMODEC)^{23,24} techniques 355 can be used for ee determinations in cases where the baseline resolution is insufficient for integration in the ¹H NMR spectra 356 (see supporting information). In addition we inspected the possible enantiomeric resolution of three carboxylic acids (7, 11, 12) 357 by using HSQC (2.0 mmol solution). Only in the case of 11 could resolution (6.15 Hz, 0.049 ppm) be detected (see supporting 358 information).

364 Conclusions

New (+)-dehydroabietylimidazolium chiral solvating agents were synthesised and tested for the resolution of Mosher's acid (5) 365 366 and its tetrabutylammonium salt (6). All nine cationic chiral solvating agents resolved 6 highly efficiently. The best resolution of 367 the enantiomers of 6 was obtained with 2c. The enantiomers of 5 were also resolved and gave better resolution in ¹H NMR spectra 368 compared to $\mathbf{6}$, which was better resolved in ¹⁹F NMR spectra. The behaviour of $\mathbf{6}$ in resolution was further studied by titration, 369 which indicated a 1:1 complexation between the host and guest. Further studies also showed that cationic chiral solvating agents 370 such as 2c can be expediently used for the determination of enantiomeric excesses of other chiral racemic carboxylates. The 371 enantiomeric resolution of seven racemic α -substituted carboxylic acids was carried out with 2c, showing that acids containing 372 polar group(s) at the α -site can be resolved efficiently. Additionally, there is no strict requirement for the presence of an aryl 373 substituent in the carboxylic acid, allowing a wider diversity of the guest substrates. The new (+)-dehydroabietylimidazolium 374 chiral solvating agents constitute a biorenewable approach to ee determination.

375 Supplementary material

376 Spectral data of ¹H and ¹³C NMR spectra and other spectra of synthesised products **1a-4c** are available on the Journal's website.
