19  
20 **Abstract**  
21

22 **Background:** Many UK military veterans experiencing mental health and well-being  
23 difficulties do not engage with support services to get the help they need. Some mental  
24 health clinics employ Peer Support Workers to help veteran patients engage, however it is  
25  
26 health clinics employ Peer Support Workers to help veteran patients engage, however it is  
27 not known how the role influences UK veteran engagement.  
28  
29

30  
31  
32  
33 **Aims:** To gain insight into the role of peer support in UK veteran engagement with mental  
34 health and well-being services.  
35  
36  
37  
38

39  
40 **Method:** A qualitative study based on 18 semi-structured interviews with veterans, peer  
41 support workers, and mental health clinicians at a specialist veteran mental health and well-  
42 being clinic in Scotland.  
43  
44  
45  
46  
47  
48

49  
50 **Results:** Four themes of the Peer Support Worker role as positive first impression,  
51 understanding professional friend, helpful and supportive connector, and an open door  
52 were identified across all participants. The Peer Support Workers' military connection, social  
53 and well-being support, and role in providing veterans with an easily accessible route to dis-

engage and re-engage with the service over multiple engagement attempts were particularly crucial.

**Conclusions:** The Peer Support role enhanced veteran engagement in the majority of instances. Study findings mirrored existing peer support literature, provided new evidence in relation to engaging UK veterans, and made recommendations for future veteran research and service provision.

### Keywords

Peer Support, Peer Support Worker, military veteran, engagement, mental health, qualitative.

### Declaration of Interest

The authors declare no conflicts of interests. The authors alone are responsible for the content and writing of this article.

### Introduction

There is growing awareness that some veterans experience difficulties transitioning to civilian life when they leave military service (Samele, 2013). A UK veteran is defined as anyone who has served as a member of the British military forces for one day or more (Macmanus & Wessely, 2013). Veterans account for approximately 2.56m of the UK population (Ministry of Defence, 2015). UK veteran needs are considered in a Military Covenant which includes the State's duty of care to ensure veterans do not suffer disadvantage as a result of their military service (Macmanus & Wessely, 2013). The majority

030517 Final Revised Original article: Peer support role in veteran engagement

1  
2  
3 of UK veterans make successful transitions into civilian life after military service (Iversen, et  
4  
5 al., 2015b), however a significant minority of UK veterans experience complex, comorbid  
6  
7 mental health and well-being difficulties including depression, anxiety, anger, alcohol  
8  
9 addiction, homelessness, unemployment, relationship breakdown, criminal offending and  
10  
11 social exclusion (Fear, Jones, & Murphy, 2010; Johnsen, Jones, & Rugg, 2008; Murrison,  
12  
13 2010; Klein & Alexander, 2012; Murphy, Iversen, & Greenberg, 2008).

14  
15  
16  
17  
18  
19 Research indicates that part of the problem is that many UK military veterans experiencing  
20  
21 mental health and well-being problems have difficulties engaging with mental health  
22  
23 treatment programmes to get the help they need (Iversen et al., 2005a; Kitchiner, Roberts,  
24  
25 Wilcox, & Bisson, 2012), as evidenced by their not seeking help or attending mental health  
26  
27 appointments (Owen, Pyne, Seal, & Cucciare, 2016). Veterans do not engage for a number  
28  
29 of reasons including mental health stigma (Klein & Alexander, 2012); not feeling understood  
30  
31 (Murrison, 2010); poor recognition of treatment need (Iversen et al., 2010); feeling alien and  
32  
33 disconnected from civilian support services (Ahern et al., 2015); and only accepting the need  
34  
35 for help when a crisis point is reached (Murphy, Hunt, Luzon, & Greenberg, 2013). This has  
36  
37 led to questions in the UK about how best to configure mental health and well-being  
38  
39 services to engage veterans, and to questions about whether veterans should attend civilian  
40  
41 mainstream services or whether they require veteran specific services (The Scottish  
42  
43 Government, 2007; Murrison, 2010).

44  
45  
46  
47  
48  
49  
50  
51  
52 Various studies suggest Peer Support helps patients to engage with mental health services  
53  
54 (Gillard, Gibson, Holley, & Lucock, 2015). Peer Support is a wellness model in which  
55  
56 individuals with shared experiences support others in recovery (Gillard & Holley, 2014). Peer  
57  
58  
59  
60

030517 Final Revised Original article: Peer support role in veteran engagement

1  
2  
3 Support has been associated with positive role modelling (Davidson, Chinman, Sells, &  
4  
5 Rowe, 2006); reduced mental health stigma (Vayshenker et al., 2016); recovery (Collins,  
6  
7 Firth, & Shakespeare, 2016); trust (Greden et al., 2010); feeling authentic (Rebeiro Gruhl,  
8  
9 LaCarte, & Calixte, 2016) and increased social connection (Lucksted, McNulty, Brayboy, &  
10  
11 Forbes, 2015).  
12  
13

14  
15  
16  
17 A recent review article examining the development of an Optimal Integrated Care Pathway  
18  
19 for military veterans suggested UK veterans found peer mentoring beneficial (Kitchiner &  
20  
21 Bisson, 2015). However there is currently limited research on Peer Support in relation to  
22  
23 engaging the UK veteran population with mental health and well-being services.  
24  
25

26  
27 Australian studies suggest veteran Peer Support Workers {PSWs} enhance veteran patients'  
28  
29 sense of belonging, shared identity and self-determination (Bird, 2015). In addition Canadian  
30  
31 research suggests veteran PSWs increase veteran patients' sense of brotherhood,  
32  
33 connection and mental health recovery (Westwood, McLean, Cave, Borgen, & Slakov, 2010).  
34  
35 Furthermore, US studies suggest PSWs enhance veteran engagement with mental health  
36  
37 services and the provision of veteran centred care (Chinman et al., 2015).  
38  
39  
40  
41  
42

43 Peer Support research is encouraging but needs to be treated with caution in relation to the  
44  
45 UK veteran population for a number of reasons. International veteran peer support research  
46  
47 may not generalize well to the UK due to the different health and welfare systems (Klein &  
48  
49 Alexander, 2012). In addition civilian peer support research may not generalize well to the  
50  
51 UK veteran population due to the qualitatively different nature of the PSWs shared peer  
52  
53 experience: PSWs employed to engage UK veterans tend to have shared peer experience of  
54  
55  
56  
57  
58  
59  
60

030517 Final Revised Original article: Peer support role in veteran engagement

military service and adjustment to civilian life; whereas PSWs employed to engage UK civilians tend to have shared peer experiences of mental health difficulties and recovery.

Research is needed to explore the role of the PSW in veteran engagement in the UK, to understand the factors within this role which may promote veteran engagement. This qualitative study aims to inform this gap in the literature by exploring veteran, PSW and mental health clinician thoughts, feelings and experiences of the PSW role in veteran engagement at a UK clinic; providing insights and guiding future veteran research and service provision.

## Method

### Research design

Semi-structured interviews were conducted to address the exploratory research question. Interview transcripts were analysed using an inductive Thematic Analysis (Braun & Clarke, 2006).

### Research setting

Participants were purposefully recruited to the study from a specialist NHS veteran mental health and well-being clinic in Scotland. The clinic employs veterans in PSW roles to promote veteran engagement with the service at all steps of the recovery process, from first contact, to treatment and recovery. The PSWs provide the well-being service at the clinic in partnership with external agencies, supporting matters such as housing, employment and finances. The PSWs also refer veterans to the on-site psychiatrist and psychologists for assessment and mental health treatment.

030517 Final Revised Original article: Peer support role in veteran engagement

## Participants

Veteran, PSW, and mental health clinician {clinician} participants were recruited to the study.

### *Inclusion criteria*

Veteran participants were included if they had been referred by the NHS to the clinic or had self-referred, and had experienced mental health treatment and/or well-being support in the last 12 months at the clinic. PSW and clinician participants were included if they had worked at the clinic for 3 months or more.

### *Exclusion criteria*

Participants were excluded if they were not able to meet the researcher to participate, or were too mentally unwell to participate.

The study included 18 participants overall: veterans (n=10), PSWs (n=4) and clinicians (n=4). We took a pragmatic approach to determining sample size, based on the pool of participants available within the setting. We aimed to recruit an overall sample of at least 15 participants (Guest, Bunce & Johnson, 2006), drawn from the veteran, PSW and clinician groups, and encompassing a broad range of experiences. 17 veterans expressed initial interest in participating in the study, however 7 did not respond to contact to arrange an interview. This is consistent with difficulties recruiting veterans to participate in other research studies (Hotopf & Wessely, 2005).

030517 Final Revised Original article: Peer support role in veteran engagement

1  
2  
3 PSWs were aged between 35 and 54 years; 2 were male and 2 were female; all served in the  
4  
5 army; and had experience in the role of between 6 months and 3 years. Clinicians {C} were  
6  
7 aged between 25 and 44 years; 2 were male and 2 were female and all had no military  
8  
9 background. Clinicians included 3 psychologists and 1 psychiatrist, with experience in the  
10  
11 role of between 11 months and 5 years. Veteran {V} characteristics are described in Table 1.  
12  
13  
14  
15  
16  
17

### 18 **Materials and Procedure**

19  
20 The study was approved by The Ethics Committee of the University of Stirling; and by NHS  
21  
22 South East Scotland (reference NR/163AB4). One researcher (BW) recruited participants to  
23  
24 the study. Participants currently attending or working at the clinic were approached in  
25  
26 person (n=15), and former patients no longer attending the clinic were approached over the  
27  
28 phone (n=3). Participants were informed the study was confidential and that all participant  
29  
30 data were anonymised. Consented participants were interviewed at the clinic (n=17) or at  
31  
32 NHS Education for Scotland (n=1) from May to July 2016. There was no recompense for  
33  
34 participation. Using semi-structured interviews, participants were asked open questions to  
35  
36 explore their thoughts, feelings and experiences of the PSW role. Questions included “Can  
37  
38 you tell me about your experience with your PSW?” and “How did your relationship with  
39  
40 your PSW develop?” Additional probing questions were used to explore answers in more  
41  
42 detail.  
43  
44  
45  
46  
47  
48  
49  
50

51 Interviews were recorded and transcribed verbatim. Interviews lasted between 23 and 75  
52  
53 minutes. One researcher (BW) conducted the interviews. BW approached the study as an  
54  
55 active participant and from a critical realist perspective (Wikgren, 2005), exploring  
56  
57  
58  
59  
60

030517 Final Revised Original article: Peer support role in veteran engagement

participants' expressed views and implied meanings; and noting personal impressions and non-verbal observations before and after interviews in a reflexive journal.

### **Analysis**

Braun & Clarke's (2006) guide to thematic analysis was followed. Data were analysed by participant group starting with veterans, PSWs and then clinicians. Two researchers (BW and MC) conducted initial analysis of the data. Familiarisation and coding were performed manually by reading and re-reading the interview transcripts, marking relevant statements with a highlighter, and assigning a brief descriptive label for each statement in the transcript margins. BW systematically coded all data sets, and collated all statements under each code in separate files. Through a process of constant comparison BW and MC agreed initial grouping of codes. BW then systematically sorted all codes in to larger internally coherent sub-themes and themes. BW and MC reviewed the themes and agreed there was a congruency in the narratives of the 3 participant groups in relation to the research question, the codes, and the entire data set. Participant {V, PSW & C} themes and sub-themes were merged together, defined, and named.

### **Results**

Participant {V, PSW & C} themes and sub-themes are outlined in Table 2.

#### **Positive First Impression**

Most of the veteran participants suggested the PSW role enhanced their engagement with the service, beginning with an immediate positive impression of the PSW role as welcoming, credible and reassuring.

030517 Final Revised Original article: Peer support role in veteran engagement

1  
2  
3           *You just come in, and you feel welcomed there... "Come in, how are you? You like a*  
4  
5           *coffee, tea?" Straight away, it's like it lifts a burden away from you. (V9)*  
6  
7

8  
9  
10           *I can't really speak too highly of him. If it hadn't been for PSW2, I wouldn't have been*  
11  
12           *getting the help... I'd already made my mind up in that first interview. (V7)*  
13  
14

15  
16  
17  
18 All of the participants {V, PSW & C} suggested the PSWs military veteran experience was  
19 particularly crucial. Most {V, PSW & C} suggested this was because many of the veterans  
20 attending the service distrusted civilians and had an enduring sense of veteran identity,  
21 regardless of their length of military service or number of years being a veteran. This shared  
22 veteran identity facilitated easy conversations between the veterans and the PSWs,  
23 grounded in shared veteran experiences, which were more positive and reassuring than  
24 their interactions with civilian and NHS services.  
25  
26  
27  
28  
29  
30  
31  
32  
33

34  
35           *It makes a huge difference, I think if she hadn't been a veteran it would have been*  
36  
37           *much more like dealing with the NHS... you wouldn't have so much in common. I*  
38  
39           *think it would be harder to establish a relationship... Knowing that they've served,*  
40  
41           *you've instantly got a connection, you've instantly got something to talk about. (V1)*  
42  
43  
44

45  
46  
47           *I think in a first interaction, it's probably quite helpful for the veteran just to be able*  
48  
49           *to realise that somebody gets it. (C4)*  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

030517 Final Revised Original article: Peer support role in veteran engagement

1  
2  
3 *The first contact being with the Peer, someone who served, it really gets them a foot*  
4 *in the door almost... this is actually ok, and he knows what I'm talking about... it's ok*  
5 *to seek help (C3)*  
6  
7  
8  
9

10  
11  
12  
13 Some participants {PSW & C} also suggested the PSW's military veteran identity engaged  
14 veterans with the service by normalising veteran help seeking behaviour and enhancing the  
15 credibility of the clinicians' and the service overall.  
16  
17  
18

19  
20  
21 *The clinical team wouldn't be taken half as seriously, if it wasn't for the Peer Support*  
22 *Workers. (C1)*  
23  
24  
25  
26  
27

28 Some participants {PSW & C} suggested the PSW role did not help veterans engage with the  
29 service in a minority of instances due to mental health stigma. For example some veterans  
30 attend the service for clinical treatment only, and insist they do not require PSW contact  
31 after the initial registration meeting. In addition some clinicians and PSWs postulated that a  
32 minority of veterans may fail to engage with the service when they feel the veteran  
33 connection is too personal, such as when the veteran and PSW served in the military at the  
34 same time, in the same regiment.  
35  
36  
37  
38  
39  
40  
41  
42  
43

44 *Our services within the same regiment overlapped...he never came back to the*  
45 *service... perhaps it did work against me. (PSW2)*  
46  
47  
48

49 *So I've certainly had the case where people have not wanted to talk about something*  
50 *with their Peer, because they know they were there. (C2)*  
51  
52  
53  
54  
55

## 56 **Understanding Professional Friend**

57  
58  
59  
60

030517 Final Revised Original article: Peer support role in veteran engagement

1  
2  
3 Most participants {V, PSW & C} suggested the PSW role made the veterans feel their  
4  
5 military, mental health and well-being issues were understood, without the need for lots of  
6  
7 explaining. This perception of understanding was crucial to the engagement as it appeared  
8  
9 to reassure the veterans and minimise their mental health stigma, frustration and  
10  
11 embarrassment while talking about their vulnerabilities, thoughts and feelings.  
12  
13

14  
15 *My PSW knows... symptoms of PTSD... even in the sort of reception area... you can still*  
16  
17 *get that understanding. (V10)*  
18

19  
20  
21 *They've [PSWs] kind of understood where I'm coming from. When I need the extra*  
22  
23 *help. (V4)*  
24  
25

26  
27  
28  
29 *Quite a lot will say... You know if I'd been anywhere else I'd have walked out by now,*  
30  
31 *but I know that you understand what I'm talking about and you know how it feels.*  
32  
33 *(PSW3)*  
34  
35

36  
37  
38  
39 All of the participants {V, PSW & C} felt friendship with the PSWs was also important to the  
40  
41 engagement. They suggested many veterans felt lonely and distrusting in their lives  
42  
43 generally, and appreciated the informality, trust, humour and social connection the PSW  
44  
45 friendship provided.  
46  
47

48  
49 *She's a big spirit and I love that about her... I actually want to spend time with her.*  
50  
51 *(V6)*  
52  
53

54  
55  
56 *Yeah, a friend [PSW]... I'm a bit of a loner I don't have many friends. (V3)*  
57  
58  
59  
60

030517 Final Revised Original article: Peer support role in veteran engagement

1  
2  
3  
4  
5 *If I'd thought for a minute there was going to be a trust issue... I'd never have been*  
6 *back. (V7)*  
7  
8  
9

10  
11  
12 *Making them think that I'm their friend, so that they can tell me anything... because I*  
13 *wouldn't confide in somebody that was all serious. (PSW4)*  
14  
15  
16

17  
18  
19 *A really nice way of using humour... She was being very sort of soothing and helpful.*  
20 *But... having a bit of a laugh at the end. (C4)*  
21  
22  
23

24  
25  
26  
27 Some participants {V & PSW} also suggested the PSW role engaged veterans with the service  
28 through positive role modelling, evident by veterans engaging other veterans with the clinic  
29 on social media, at external events, and at the drop-in; and aspiring to be PSWs themselves.  
30  
31  
32

33  
34 *I'm building relationships... because I could play a good part in helping veterans that*  
35 *have got mental health problems and issues. (V2)*  
36  
37  
38

39  
40  
41 *Relationships, prosocial modelling... accepting that it's ok to have conversations with*  
42 *people. (C1)*  
43  
44  
45

46  
47  
48 *I know some clients think they could do the job... it can very inspiring for them. (C3)*  
49  
50  
51

52  
53 All of the PSW and clinician participants suggested the PSW role required careful training  
54 and supervision, and recruitment of PSWs with veteran experience and the correct skills and  
55 competencies, particularly compassion. They suggested this was important because the  
56  
57  
58  
59  
60

030517 Final Revised Original article: Peer support role in veteran engagement

PSW role included many challenges: working directly with actively unwell patients, managing veterans that behaved in difficult and demanding ways at times, and managing personal conflicting beliefs about behaviour or entitlement to the service.

*Getting myself on training... trying to get a better understanding of mental health.*

*(PSW1)*

*I find it difficult sometimes to justify how someone's behaving... be sympathetic towards it... it's trying to treat everyone exactly the same. (PSW2)*

*Continual informal discussion about how we're [PSW & C] working with clients... be compassionate in our reactions towards them [veterans]. (C2)*

### **Helpful & Supportive Connector**

The majority of veteran participants valued how the PSW role connected them to the clinical and well-being support they needed, including the PSW drop-in service and social activities. Most participants {V, PSW & C} felt this helped improve the veterans' quality of life, and enhance their feelings of safety and social inclusion.

*I went fishing with PSWA the other day. It was fantastic. (V6)*

*So there's always that safety net, that connection. (V4)*

*The drop in is probably key. (PSW1)*

030517 Final Revised Original article: Peer support role in veteran engagement

1  
2  
3 *Feeling rubbish and then they'll pop up. I've played scrabble... colouring in...*  
4  
5 *jigsaw. (PSW4)*  
6  
7

8  
9  
10 *Peer Support Worker led welfare idea... adds this great stabilising effect... they are*  
11  
12 *part of the treatment. (C2)*  
13

14  
15  
16  
17 *Those fundamental basic needs, and sometimes they need to be in place first... Peer*  
18  
19 *Support Workers establish a lot of that ... signposting to benefits, offering sometimes*  
20  
21 *a listening ear... we're working with people that can be quite avoiding... it's really*  
22  
23 *helpful. (C1)*  
24  
25

26  
27  
28  
29 Some veteran participants also reflected on how the PSW role made them feel positive  
30  
31 about getting help, and contrasted the PSW experience to experiences at other support  
32  
33 services in the past which they felt were daunting or unhelpful.  
34

35  
36 *I would not give a social worker the time of day... with veterans it's easier, and it's*  
37  
38 *beneficial. (V2)*  
39

40  
41  
42  
43 Most participants {V, PSW & C} suggested the PSW role engaged veterans with clinical  
44  
45 assessment at the service by selling clinician expertise and treatment method credibility.  
46  
47 This is reflected in the participant characteristics (Table 1) which includes 4 veterans that  
48  
49 agreed to self-refer for mental health assessment at the service following discussions with  
50  
51 their PSW.  
52

53  
54  
55 *I think when you're feeling bad, they're [PSWs] an essential part of the team... You*  
56  
57 *maybe need to be dragged a little bit, or pushed a little bit towards something. (V10)*  
58  
59

1  
2  
3  
4  
5 *Being very directive with some [veterans]... you need this, you will turn up. (PSW3)*  
6  
7  
8

9  
10 *Putting a kind of friendly face on that, and reassuring them [veterans] it's all*  
11 *evidence based stuff. (PSW2)*  
12  
13

14  
15  
16  
17 *I've heard them [PSWs] say "oh don't worry, that person will see you"... our*  
18 *psychiatrist is really nice." (C3)*  
19  
20  
21

22  
23  
24  
25 Many participants {V, PSW & C} also suggested the PSW role enhanced veteran engagement  
26 with on-going mental health treatment at the service by improving the clinical process and  
27 treatment experience in direct and indirect ways. Direct ways included meeting the veterans  
28 before and after mental health treatments. Indirect ways included providing the clinicians  
29 with information about the veteran patient's well-being progress between mental health  
30 treatments, and helping the clinicians to better understand veterans' feelings and  
31 behaviours about military contexts.  
32  
33  
34  
35  
36  
37  
38  
39  
40

41  
42 *I think the real expertise of the service is... [PSWs] specialist knowledge. (C4)*  
43  
44

45  
46  
47 *It's an ongoing process in therapy... you need to be re-formulating... establishing safe*  
48 *bases... draw more from the PSW to sort of help with that. (C1)*  
49  
50  
51

52  
53  
54 Most PSW and clinician participants highlighted the subjective nature of veteran  
55 engagement, and how important it was for the PSWs to exercise discretion and judgement,  
56  
57  
58  
59  
60

030517 Final Revised Original article: Peer support role in veteran engagement

1  
2  
3 and pro-actively manage the amount and nature of the engagement with each veteran on a  
4  
5 case by case basis over time. This was important because the PSWs did not want the  
6  
7 veterans' to form attachments to the clinic when they were no longer required, the PSW  
8  
9 role ultimately aimed to support veterans' with transitioning to engage with civilian life as  
10  
11 their mental health and well-being improved.  
12  
13

14  
15 *You can normally sense when it's time to let them go... there's a girl I've had on the*

#### 24 25 **Open Door**

26  
27 Many participants {V, PSW & C} suggested the PSW role enhanced veteran engagement with  
28  
29 the service over multiple engagement attempts in many instances, providing a non-  
30  
31 judgemental open door conduit for veterans to dis-engage and re-engage with the service  
32  
33 as needed. They felt this aspect of the PSW role was crucial because veterans often needed  
34  
35 multiple attempts at engaging with the service; needed to re-engage as their circumstances  
36  
37 changed over time; or engaged with the service in crisis. This is reflected in the participant  
38  
39 characteristics (Table 1) which shows that 4 of the 5 re-engaged veteran participants were  
40  
41 receiving mental health treatment at the service at the time of this study.  
42  
43  
44  
45

46  
47 *It was just in destructive mode. I had lost a lot in my life... business... the family broke*  
48  
49 *up... prison... But at the time I couldn't connect... It was just too much for me. (V2)*  
50  
51  
52

53  
54 *It makes me feel more confident asking. Cause before I thought I'll just struggle on*  
55  
56 *my own. (V3)*

*You're always a client of ours, you're never discharged. (PSW2)*

## Discussion

The PSW's military connection was particularly crucial to how the PSW role engaged veterans with the service in direct and indirect ways. From the initial positive impression of the service and throughout the veteran's treatment pathway at the service, the PSW's military connection helped to reduce veteran mental health stigma and normalise veteran mental help seeking behaviour. In addition the PSW role helped to provide veteran patients with a more veteran centred clinical process and treatment experience, and create an environment of belonging, shared identity and understanding. These findings mirror existing international veteran research (Chinman et al., 2015; Bird, 2015; Westwood et al., 2010). These findings also appear to support recommendations for mental health services to be veteran led (The Scottish Government, 2007) and suggest PSW roles designed to engage UK veterans should include veteran experience as an essential recruitment criteria.

The PSW role as the open door conduit to the clinic was also extremely important to the engagement. Participants suggested veterans often needed PSW support to dis-engage and re-engage with the service over the course of multiple engagement attempts. The PSW role supported this multiple engagement attempt process by welcoming the veterans back to the clinic in a non-judgemental way, without issuing penalties for previous non-attendance at clinics or long wait lists to see clinicians for assessment. This finding appears to support

030517 Final Revised Original article: Peer support role in veteran engagement

1  
2  
3 the recommendation for veteran mental health services to be accessible (The Scottish  
4  
5 Government, 2007), and provides new research detail about the level of accessibility and  
6  
7 support UK veterans need. This finding also raises questions about the configuration of  
8  
9 services. For example, are current mental health pathways in the UK adequately  
10  
11 accommodating this veteran need for multiple engagement attempts?  
12  
13

14  
15  
16  
17 The PSW's role in providing veterans with social and well-being support grounded in shared  
18  
19 peer experience were also identified as key to the engagement. The PSW's in this study had  
20  
21 shared peer experience of being a veteran, which included knowing military people in  
22  
23 common, experiencing military deployments at the same place, and having a shared  
24  
25 understanding of the cultural differences between military and civilian life. Consistent with  
26  
27 existing civilian PSW research, the veteran PSW role provided friendship, social connection  
28  
29 and trust (Lucksted et al., 2015; Greden et al., 2010), and helped reduce mental health  
30  
31 stigma (Vayshenker et al., 2016), improve quality of life (Repper et al., 2013) and inspire  
32  
33 positive role modelling (Davidson, Chinman, Sells, & Rowe, 2006). This finding is interesting  
34  
35 because the veteran PSWs in this study have shared peer experience of being a veteran,  
36  
37 whereas the civilian PSWs in the civilian studies have shared peer experience of recovering  
38  
39 from a mental health difficulty. This finding suggests that PSWs with qualitatively different  
40  
41 shared peer experiences can engage mental health patients with mental health services in  
42  
43 similar ways.  
44  
45  
46  
47  
48  
49

50  
51  
52 PSW supervision, training and competencies were considered important to veteran  
53  
54 engagement with the service. The need for PSW supervision and training mirror existing  
55  
56 research (Repper & Carter, 2011), however this study also highlighted the need for  
57  
58  
59  
60

030517 Final Revised Original article: Peer support role in veteran engagement

1  
2  
3 competencies such as compassion and judgement. Compassion was considered important in  
4  
5 the PSW role to ensure veterans attending the service felt fully supported regardless of their  
6  
7 behaviour or length of military service. Judgement was considered important in the PSW  
8  
9 role to ensure veterans were engaged with the service on a case by case basis to support  
10  
11 their individual needs. These findings demonstrate the subjective nature of veteran  
12  
13 engagement and the PSW role, and highlight the need for future PSW research to  
14  
15 acknowledge this, and include both quantitative and qualitative evaluation. In addition,  
16  
17 these findings suggest veteran experience, competencies and support environment are all  
18  
19 important in how the PSW role engages veterans with services. Future research could  
20  
21 explore the lived peer experience required to optimise the PSW role in veteran engagement  
22  
23 with mental health and well-being services. For example, would PSWs with both veteran  
24  
25 and mental health lived experiences provide additional benefits to the PSW role in veteran  
26  
27 engagement with services? Future research could explore the role of the PSW in veteran  
28  
29 engagement with mental health services with a Randomised Control Trial methodology  
30  
31 testing differences in engagement when there is no PSW, civilian PSW not attached to  
32  
33 veteran services, and PSW within veteran services.  
34  
35  
36  
37  
38  
39  
40  
41  
42

43 Some of the PSW's and clinician's hypothesised that the military connection may dis-engage  
44  
45 a minority of veterans that directly served in the military at the same time and in the same  
46  
47 regiment as the PSW, due to mental health stigma. There is no evidence that this is the  
48  
49 reason a minority of veterans fail to engage with the service, however it is a possibility.  
50  
51 Future research could explore this further, and services may want to bear this in mind when  
52  
53 assigning PSW's to veteran clients.  
54  
55  
56  
57  
58  
59  
60

030517 Final Revised Original article: Peer support role in veteran engagement

### Limitations

The study includes veteran participants that successfully engaged with PSWs at one clinic in Scotland and mostly served in the army. The study therefore has limited representation of veterans that served in other military forces, and no representation of veterans that failed to engage with the PSWs, veterans opting for clinical only treatment at the clinic, and veterans engaged in mainstream NHS services without PSW support. These are limitations and it would be beneficial to understand the perspectives of these veteran groups in future research.

### Conclusions

This exploratory study suggests the PSW role enhanced veteran engagement with mental health and well-being services in direct and indirect ways in the majority of instances. The PSW role provided a positive first impression of the service, an understanding professional friend, a helpful and supportive connector to the services provided, and an open door to re-engage with the service when needed. The PSWs military connection, social and well-being support, and role in providing veterans with an easily accessible route to dis-engage and re-engage with the service over multiple engagement attempts were particularly crucial. Study findings mirrored existing peer support literature, provided new evidence in relation to UK veterans, and made recommendations for future veteran research and service provision.
