Brief 66-10191

NASA TECH BRIEF

NASA Tech Briefs are issued to summarize specific innovations derived from the U. S. space program and to encourage their commercial application. Copies are available to the public from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151.

Tool Post Modification Allows Easy Turret Lathe Cutting-Tool Alignment

The problem:

Cutting tools on turret lathes must be aligned on the center of the spindle. Long operation causes the turret ramways to wear, resulting in tool misalignment. Proper alignment requires time-consuming adjustments of the tool angle.

The solution:

Modify the existing tool holder to allow the necessary alignment, independent of the cutting-tool angle adjustment, and design the tool post with a hydraulic lock-in feature to keep the tool holder in position. How it's done:

The tool holder is modified to accommodate two adjustment screws that move the tool holder up or down along the tool post until the tool is aligned with the spindle as required.

The tool post contains a hydraulic system which, once the cutting tool is aligned with the spindle, is

The piston in turn bears against the tool holder, locking it in place.

Notes:

- 1. The tool post can be used on horizontal and vertical turret lathes and other engine lathes.
- 2. Inquiries concerning this innovation may be directed to:
