Brief 66-10378

NASA TECH BRIEF

NASA Tech Briefs are issued to summarize specific innovations derived from the U. S. space program and to encourage their commercial application. Copies are available to the public from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151.

Nonhazardous Acid Etches Weld Samples

The problem:

Etching of weld samples of series 300 stainless steels and some other high temperature alloys is usually done in solutions of nitric and hydrofluoric acids. The use and storage of these acids constitute a hazard to operating personnel.

The solution:

An etchant bath of harmless citric acid in conjunction with a 24 volt dc power supply.

How it's done:

The etching action is activated by a 24 volt dc power supply through an anode connected by a spring clip to the weld sample and a cathode suspended in the citric acid bath.

Notes:

1. The citric acid solution is limited in its use to a rather small range of metals it will successfully etch.

2. Inquiries concerning this invention may be directed to:

Technology Utilization Officer
Marshall Space Flight Center
Huntsville, Alabama 35812
