# NASA TECH BRIEF

NASA Tech Briefs are issued to summarize specific innovations derived from the U.S. space program, to encourage their commercial application. Copies are available to the public at 15 cents each from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151.

## Stationary Device Produces Homogeneous Mixture of Fluids

### The problem:

To design a device, without moving parts, that will produce a homogeneous mixture of two or more one-phase or two-phase fluids.

### The solution:

A device with helical passageways through which the fluids are forced into turbulent flow by the system pressure differential.

### How it's done:

The device contains two concentric flow guides with helical passageways. The fluids to be mixed enter one end of the device through intake ports on an inlet manifold, and are forced through the helical passageway of the inner flow guide to a collection

manifold at the opposite end of the device. A reversal in the axial flow direction of the fluid then occurs as it passes through the helical channel of the outer flow guide. After passing through this channel, the mixture, which is now homogeneous as a result of the induced turbulence, is released through a discharge port.

### Note:
