Brief 67-10273

NASA TECH BRIEF

NASA Tech Briefs are issued to summarize specific innovations derived from the U.S. space program, to encourage their commercial application. Copies are available to the public at 15 cents each from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151.

Spherical Joint Connects Axially Misaligned Flanges

The problem:

To establish a connection in a duct assembly between axially misaligned flanges that are separated by a fixed distance from each other.

The solution:

An interconnecting straight tube that adjusts to accommodate variations in relative location of the flanges by pivoting. Adjustment is by spherical (concave and convex) mating faces and a spherical-faced indexing swivel flange for bolting backup. Inside diameter of the swivel flange is eccentric to the bolt pattern, and the flange is rotated (indexed) to provide clearance with the tube while aligning the bolt holes. The swivel clearance bears against a fixed-tube flange having a common center spherical radius

on both sides and oversize bolt holes to permit lateral offset through 360°.
