

# NASA TECH BRIEF

NASA Tech Briefs are issued to summarize specific innovations derived from the U.S. space program, to encourage their commercial application. Copies are available to the public at 15 cents each from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151.

## Pneumatic Raft Automatically Reforms after Rupture of Buoyant Member

### The problem:

In operation, rafts or floats that maintain their buoyancy by means of pneumatically inflated chambers, may lose their buoyancy through a puncturing, rupturing, or tearing of the inflated member. In the case of either heavy seas or a disabled occupant, this would normally lead to loss of the raft and its occupant.

### The solution:

Unique, inflated, expandable socks are attached within the inflated chamber in such a way that collapse of the chamber wall through damage, causes the

adjacent sock to expand and restore the original configuration.

### How it's done:

The expandable socks are attached to the wall of the inflated chamber in such a manner that a rupture to one (or two) of the quarter section(s) results in a pressure differential between the damaged quarter section and its adjacent undamaged member. By this pressure differential, the affected sock is caused to expand and extend throughout the damaged quarter section as indicated by the broken lines in the figure. This effectively restores both the configuration and buoyancy of the damaged quarter section.
