Brief 69-10390

NASA TECH BRIEF

NASA Tech Briefs are issued to summarize specific innovations derived from the U.S. space program, to encourage their commercial application. Copies are available to the public at 15 cents each from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151.

A Thirty-Six Element Array Antenna System

The problem:

To design an antenna system which does not require the movement of the antenna or the presence of an operator.

The solution:

Use a thirty-six element square array, with mutual coupling between crossed slots for array elements as an electronically scanned tracking antenna.

How it's done:

A mathematical model was built using actual values to determine operating characteristics of array elements in different beam scanning directions. This computer design technique was used to produce information pertaining to the number and configuration of antenna elements required for optimum scanning performance in multielement antenna arrays. The information gained through this study indicates that the crossed slot arrangement produces a nearly hemispherical pattern and the resultant beam may be scanned through the entire hemisphere by means of thirty-five digital phase shifters. These are capable of shifting phase in 22.5° increments from 0° to 360° . Notes:

- 1. This innovation may be of interest to designers and manufacturers of microwave antenna systems.
- 2. Documentation is available from:
