# NASA TECH BRIEF

NASA Tech Briefs announce new technology derived from the U.S. space program. They are issued to encourage commercial application. Tech Briefs are available on a subscription basis from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151. Requests for individual copies or questions relating to the Tech Brief program may be directed to the Technology Utilization Division, NASA, Code UT, Washington, D.C. 20546.

## New Method for Photoresist Stripping

### The problem:

Conventional methods used to strip cured photoresist tend to leave trace contamination that is undesirable in semiconductor work. These methods are inconvenient; they require constant elevated temperature baths, and the stripping chemicals have short effective life.

### The solution:

A new stripping procedure for a negative working photoresist that employs dehydration of the resist in a vacuum. Following vacuum dehydration, the resist film is removable with ordinary solvents.

### How it's done:

After the semiconductor substrate is coated with photoresist, exposed, developed, cured and etched, the cured resist-coated substrate is placed in a vacuum of  $1 \times 10^{-6}$  torr for a period of time governed by the coating thickness. After vacuum dehydration, the

substrate is rinsed in ordinary solvent (xylene, acetone, etc.) which readily removes the photoresist.

Since the photoresist itself contains solvent (xylene), no contaminating materials are introduced, thus eliminating the possibility of adverse chemical reactions which can take place in conventional stripping.

### Note:

No additional documentation is available.

### Patent status:

Inquiries about obtaining rights for the commercial use of this invention may be made to NASA, Code GP, Washington, D.C. 20546.
