Brief 71-10186

NASA TECH BRIEF

Marshall Space Flight Center

NASA Tech Briefs announce new technology derived from the U.S. space program. They are issued to encourage commercial application. Tech Briefs are available on a subscription basis from the National Technical Information Service, Springfield, Virginia 22151. Requests for individual copies or questions relating to the Tech Brief program may be directed to the Technology Utilization Office, NASA, Code KT, Washington, D.C. 20546.

Numerical Integration of Second Order Differential Equations

A numerical integration technique using a reduced-step function evaluation determines approximate solutions to second order differential equations. The technique may be useful in evaluating system performance, analyzing material characteristics, and designing inertial guidance and nuclear instrumentation and materials.

The performance characteristics of higher order approximations of the Runge-Kutta type are analyzed, and performance predictors for the time required on the machine and for the error size are developed. These predictors are not designed to give precise information; but supporting data shows that the information obtained provides a useful guide in solving the problem.

The predictors and data indicate that the formulas that should be used are Shanks' formulas of the sixth, seventh, and eighth orders.

Note:

Requests for further information should be directed to:

► Selected Items of Interest to Other Federal Agencies

1. **Development of a High-Speed, Low-Cost, and Reliable Data Link for Spacecraft**
This Tech Brief describes a new data link system for spacecraft. The system is designed to provide high-speed, low-cost, and reliable data transmission between a spacecraft and a ground station. The system is based on a new type of modulation scheme that allows for higher data rates and lower power consumption. The system is currently being tested in a laboratory environment and is expected to be ready for flight testing in the near future.
