Brief 71-10535

# NASA TECH BRIEF

## Langley Research Center

NASA Tech Briefs announce new technology derived from the U.S. space program. They are issued to encourage commercial application. Tech Briefs are available on a subscription basis from the National Technical Information Service, Springfield, Virginia 22151. Requests for individual copies or questions relating to the Tech Brief program may be directed to the Technology Utilization Office, NASA, Code KT, Washington, D.C. 20546.

### Vibration Characteristics of Ring-Stiffened Orthotropic Shells of Revolution

#### The problem:

To determine the natural frequencies and mode shapes of thin shells of revolution in order to evaluate the dynamic behavior of structures in which thin shells are some of the components.

#### The solution:

A computer program which solves for all the vibration modes and frequencies of thin shells of revolution having general meridional curvature and orthotropic elastic properties.

#### How it's done:

The procedure is based on the finite-element method in which the direct stiffness approach is used. A geometrically exact finite-element (shell) is employed, and its geometric characteristics are used as program inputs in the form of functions of the meridional coordinate.

The program is applicable to any shell of revolution whose meridional shape is defined by the user. Calculations for shells of revolution with or without ring stiffeners are possible. Included with the program are two sample calculations.

#### Notes:

1. This program is written in FORTRAN IV for use on the CDC-6400 or CDC-6600 computers.
2. Requests for further information may be directed to:

COSMIC

Reference: B71-10535

#### Patent status:

No patent action is contemplated by NASA.
