# **NASA TECH BRIEF**

# NASA Pasadena Office

NASA Tech Briefs announce new technology derived from the U.S. space program. They are issued to encourage commercial application. Tech Briefs are available on a subscription basis from the National Technical Information Service, Springfield, Virginia 22151. Requests for individual copies or questions relating to the Tech Brief program may be directed to the Technology Utilization Office, NASA, Code KT, Washington, D.C. 20546.

# Eigenvalue Algorithm Based on a Combined Sturm Sequence and Inverse Iteration Technique (EASI)

## The problem:

An accurate and efficient method is needed for solutions to eigenvalue problems.

### The solution:

A computer program was developed for the computation of specified roots and associated vectors of the eigenvalue problem  $Aq = \lambda Bq$  with band-symmetric A and B, B being positive definite.

#### How it's done:

The desired roots are first isolated by the Sturm sequence procedure. Then a special variant of the inverse iteration technique is applied for the individual determination of each root along with its vector.

## Notes:

- This program was written in FORTRAN V for the UNIVAC 1100-series computers.
- Inquiries concerning this program should be directed to:
