# NASA TECH BRIEF

## *Lewis Research Center*

NASA Tech Briefs announce new technology derived from the U.S. space program. They are issued to encourage commercial application. Tech Briefs are available on a subscription basis from the National Technical Information Service, Springfield, Virginia 22151. Requests for individual copies or questions relating to the Tech Brief program may be directed to the Technology Utilization Office, NASA, Code KT, Washington, D.C. 20546.

### Inexpensive Pocket-Sized Solar Energy Meter (Insolometer)

An inexpensive pocket-sized solar energy meter (insolometer) directly measures the amount of energy available in the sunlight falling on the earth over the range from 1 to 1250 watts/meter<sup>2</sup>. It consists of a single silicon solar cell wired in series with a miniature ammeter. The entire device can be packaged in a 4.4 cm (1.75 in) cube.

This insolometer operates on the principle that the short circuit current from a solar cell is directly proportional to the amount of light that shines on the cell. This short circuit current is measured with a small ammeter, and the ammeter is calibrated as watts/meter<sup>2</sup> against readings from a "standard solar cell." Thereafter, the device provides a direct measure of the solar energy shining on the cell.

As the cost of fossil-fueled energy increases, the use of solar energy as an alternative becomes more attractive. In order to design solar energy systems of the proper size, it is necessary to know the amount of solar energy available at the site. This pocket insolometer is ideally suited to making on-site measurements of the solar energy available.

#### Note:

No additional documentation is available. Specific technical questions, however, may be directed to:
