A research plan is being implemented at NASA to investigate inlet mode transition for turbine-based combined-cycle (TBCC) propulsion for the hypersonic community. Unresolved issues have remained on how to design an inlet system to supply both a turbine engine and a ram/scramjet flowpath that operate with both high performance and stability. The current plan is aimed at characterizing the design, performance and operability of TBCC inlets through a series of experiments and analyses. A TBCC inlet has been designed that is capable of high performance (near MIL-E-5008B) recovery) with smooth transitioning characteristics. Traditional design techniques were used in an innovative approach to balance the aerodynamic and mechanical constraints to create a new TBCC inlet concept. The inlet was designed for top-end Mach 7 scramjet speeds with an over/under turbine that becomes cocooned beyond its Mach 4 peak design point. Conceptually, this propulsion system was picked to meet the needs of the first stage of a two-stage to orbit vehicle. A series of increasing fidelity CFD-based tools are being used throughout this effort. A small-scale inlet experiment is on-going in the GRC 1'x1' Supersonic Wind Tunnel (SWT). Initial results from both the CFD analyses and test are discussed showing that high performance and smooth mode transitions are possible. The effort validates the design and is contributing to a large-scale inlet/propulsion test being planned for the GRC 10'x10' SWT. This large-scale effort provide the basis for a Combined Cycle Engine Testbed, (CCET), that will be able to address integrated propulsion system and controls objectives.

(Initial Screening Results of a Small-Scale Inlet Mode Transition Experiment and progress toward a Large-scale IMX testbed)

Cleveland, Ohio

Bobby Sanders & Lois Weir TechLand Research, Inc. North Olmsted, Ohio

October 30 - November 1, 2007

Overview

Background, (definition, history & objectives)

TBCC Inlet Design, (dual flow path, constraints & CFD)

CFD Results, (validation, performance & test guidance)

1x1 SWT screening results (configurations, M4, & off-design) Conclusions and 10x10 Large-scale tests

Background: (TBCC=Turbine Based Combined Cycle)

- Mode-transition: definitions (IMX= Inlet Mode X, transition)
- Previous/related programs:
 - M5, X43b
 - HiSTED, Robust Scramjet, RATTLRS, FALCON
- Over-under concept and TBCC
- Current effort: Two-pronged testing
 IMX = small-scale
 - Large-scale Combined Cycle Engine (inlet/controls/engines) Collaborative effort with ATK/Boeing/Williams
- TBCC IMX Objectives

TBCC Inlet Research Objectives

Research over/under split flow inlet for TBCC.

- Demonstrate mode transition at small and large-scales.
- Develop a integrated database of performance & operability.
 Low-speed inlet (sized for Mach 4 turbine engine).
 High-speed inlet (DMRJ for Mach 7 cruise)

Validate CFD predictions for each inlet's design approach, and performance and operability prediction.

- Measure distortion characteristics throughout the mode transition Mach number range.
- Operability database for future mode transition controls research
- Testbed for integrated inlet/engine propulsion system tests

Inlet mode transition addressed by small & large-scale experiments

- Used 2D aerodynamic design and mechanical concept from small-scale IMX effort.
 - IMX, 'Inlet Mode Transition' is a small screening inlet model to qualitatively understand operability.
 - Key follow-on test is to get large scale data for quantifying performance, operability, controls development
- Forebody required roughly based on Mach 7 X43-b vision vehicles
- Facility selection: Turbine engine siziing requires large facility
 - GRC 10'x10' propulsion supersonic wind tunnel selected
- Remotely variable ramp and rotating HS&LS inlet cowls
- Over-travel LS cowl to allow M3 to M4 mode transitions
- Variable bleeds, bypasses to allow test flexibility and controls work
- Flow metering on both turbine flowpath & DMRSJ flowpaths
- Engines diameter of ~12" chosen.
 - Mid-sized 12" engine being developed towards M4 in HiSTED, RATTLRS

Inlet model provides 'strongback' for propulsion integration

October 30 - November 1, 2007

- Low-speed: supersonics / mixed comp. / bleed / visc.effect / YF-12 / XB-70 / SST>HSCT
- Integration: vehicle, turbofan, high-speed flowpath
- Mach 7 Hydrocarbon fueled Scramjet with Mach 4 transition from Turbine
- Historical recoveries / Flow splits / engine demand / mission
- Impact of CFD:
 - •Visualize, Instrument, Test plan,
 - •Design, Controls

Inlet design driven by TBCC studies, CFD tools, and physical constraints

CFD has been an integral tool throughout IMX project

CFD able to model complexity of inlet bleed design

Mode Transition at Mach 4

Sequence of 2D steady-state solutions at 2-deg increments

4 deg

Back-pressured CFD Study: Performance 'Cane' Curves

- Low-Speed Inlet Performance
- 1x1 SWT Run 26 bleed configuration
- Constant bleed plenum pressure b.c., (non-physical stability)

CFD suggests LS recovery performance obtainable

1x1 SWT screening results, 50+runs to date

• Configurations / bleed

- M4 results: performance, popping behavior, distortion, Mode-x
- Off-design results: recovery and distortion

Mach 4 performance is near design goal: mode transition smooth 27

Conclusions

- TBCC Inlet design approach is valid
- CFD as a toolset is becoming helpful in inlet design
 - > and continues to be part of: Visualize, Validate, Instrument, Test plan
 - > fixed exit bleed boundary conditions needs further modeling
- Small-scale Test Results: 1x1 SWT
 - > near mil-spec recovery demonstrated
 - > distortion effect must be investigated further
 - > cowl contour / reduced throat Mach number is desirable
 - > smooth mode-x is possible

TBCC Inlet design verified for large-scale 10x10 SWT entry

- Mechanical design nearly complete, hardware delivery in spring '08
- > Results to date show confidence that larger-scale will perform as designed
