

Informational Briefing:

Risk of Microgravity-Induced Visual Impairment and Elevated Intracranial Pressure (VIIP)

Wednesday May 25, 2011.

Christian Otto, M.D., VIIP Project Scientist

Outline

- Background
- Ocular Findings
- Cephalad Fluid Shift
- Current Assessment Methodologies
- Cases
- Contributing Structures of the Eye
- CSF Production
- CSF Resorption
- Exacerbating Factors
- Current Measures
- Draft Research Plan
- Opportunities for Partnership

Background

- Eight cases identified, represent 23.5% of the 34 crewmembers flown on the ISS, with inflight visual changes and pre-to-postflight refractive changes. In some cases, the changes were transient while in others they are persistent with varying degrees of visual impairment.
 - Decreased intraocular pressure (IOP) postflight was observed in 3 cases.
 - Fundoscopic exams revealed postflight findings of choroidal folds in 4 cases, optic disc edema in 5 cases and presence of cotton wool spots in 3 cases.
 - Optical coherence tomography (OCT) confirmed findings of choroidal folds and disc edema and documented retinal nerve fiber layer thickening (4 cases).
 - Findings from MRI examinations showed posterior globe flattening (5 cases) and optic nerve sheath distension (6 cases).
 - Opening cerebrospinal fluid (CSF) pressure was elevated in 4 cases postflight reflecting raised intracranial pressure.
- While the etiology remains unknown, hypotheses speculate that venous insufficiency or hypertension in the brain caused by cephalad fluid shifts during spaceflight are possible mechanisms for ocular changes in astronauts.

Risk Background - Ocular Symptoms

- 8 cases identified (23.5% of 34 long duration crew) with inflight visual changes and pre-to-postflight refractive changes.
 - Elevated Intracranial Pressure measured postflight

Hyperopic Shifts
Up to +1.75 diopters

Choroidal Folds
parallel grooves in the posterior pole

Optic Disc Edema (swelling)

Globe Flattening

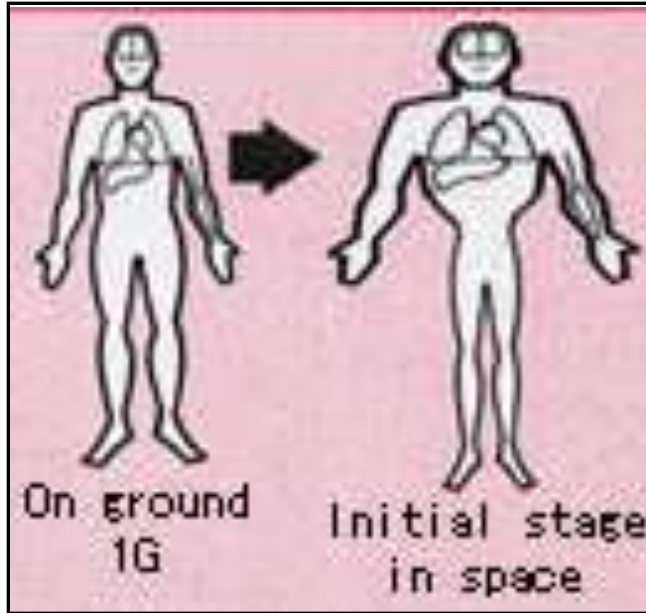

MRI Orbital Image showing globe flattening

Vision distortion
Cotton "wool" spots

Cephalad Fluid Shift

Hydrostatic Pressure Changes

Rowell, 1988.

Venous Pressure & ICP Increases in Microgravity-Supine Model

ICP=3.9 mmHg

Standing

ICP=11.9 mmHg

Supine

Internal Jugular Vein Caliber

Increased Volume=Increased Pressure

Risk Background - Intracranial Pressure

MRI Brain Venogram

CHOROIDAL FOLDS

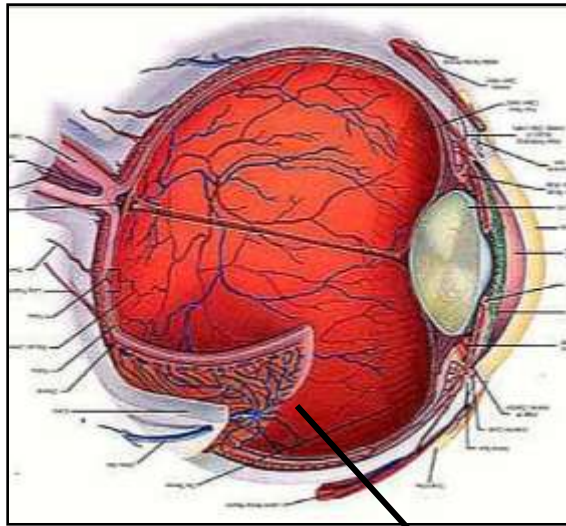

- Choroidal folds are parallel grooves or striae that involve the choroid in the posterior pole.
- They are usually horizontal but may be vertical, oblique, or irregular and are usually situated temporally, rarely extending beyond the equator.
- Their characteristic appearance on fundusoscopic examination, with the crests appearing yellow and less pigmented, is caused by the stretching and thinning of the retinal pigment epithelium, and the troughs appearing darker are caused by retinal pigment epithelium compression.
- Known causes of choroidal folds include orbital diseases or tumors, choroidal tumors, posterior scleritis, hypotony, chronic papilledema or optic nerve tumor, choroidal neovascular membrane, scleral buckle, and central serous

The Choroid

The choroid contains a dense vascular network terminating with the fenestrated choriocapillaris

Case Report 1: Pre & Post Flight Fundoscopy

[Top Pre Flight]

Fundoscopy images of the right and left posterior pole.

[Bottom Post Flight]

Fundoscopy images of the right and left posterior pole showing choroidal folds below the optic disc (top arrow) and a “cotton-wool” spot (bottom arrow) in the inferior arcade in the right eye.

Optic disc imaging did not show presence of observable disc edema

Case Report 3: Pre & Post Flight Fundoscopy

[Top Pre Flight]

Fundoscopic images of the right and left optic disc.

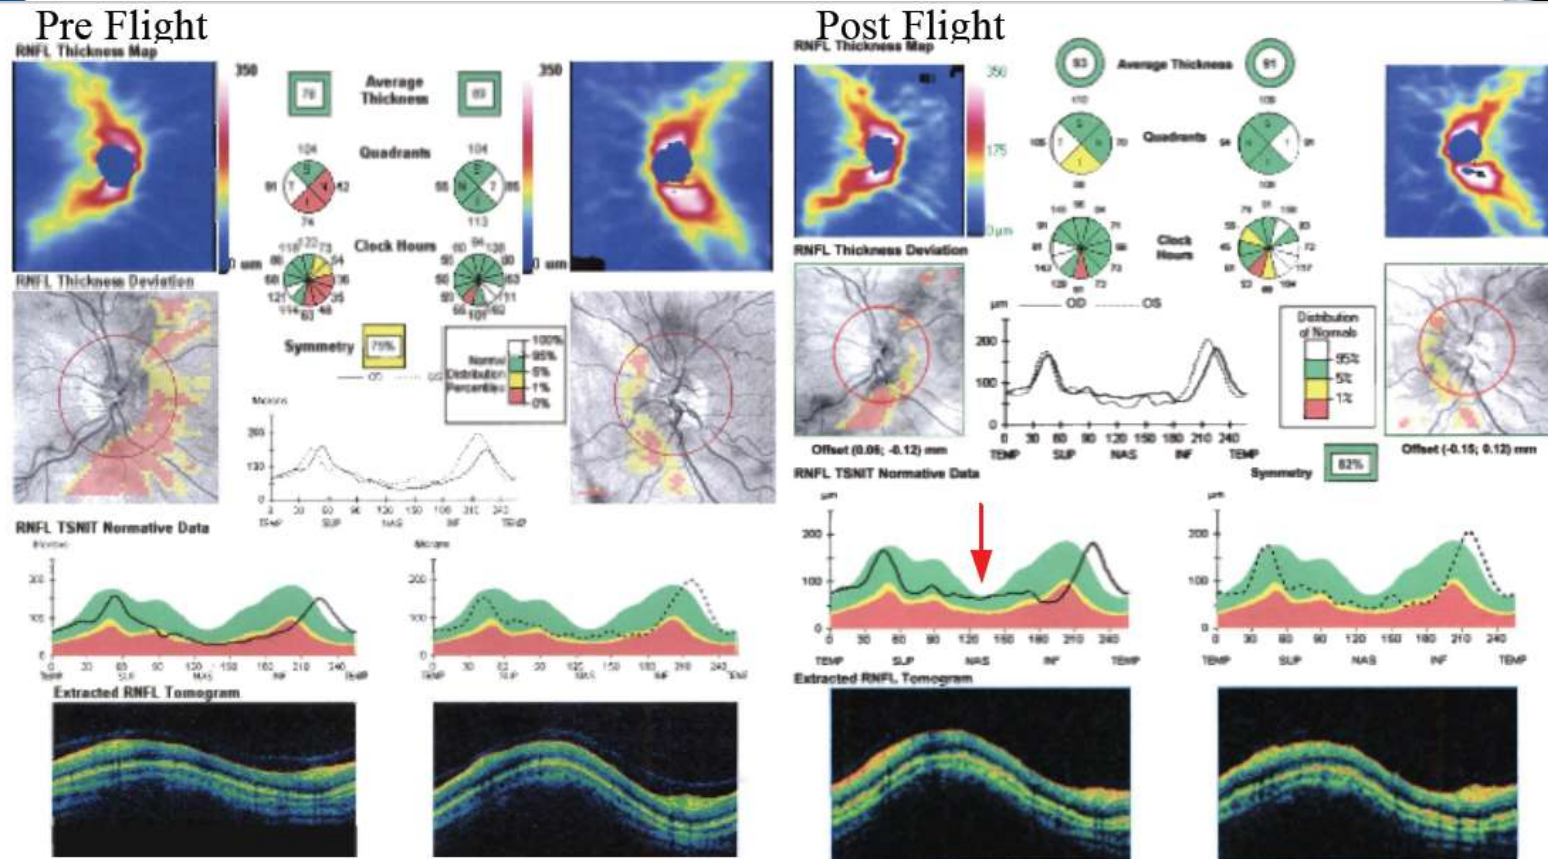

[Bottom Post Flight]

Fundoscopic images of the right and left optic disc showing Grade 3 edema at the right optic disc and Grade 1 edema at the left optic disc. Fig.

Case Report 5 - Continued

[Left] Pre flight Zeiss Cirrus OCT showing right and left NFL 'TSNIT' (temporal, superior, nasal, inferior and temporal curve).

[Right] Post flight Zeiss Cirrus OCT showing increased thickness of the nasal (red arrow) NFL. Greater increase is noted in the right eye in the nasal quadrant NFL thickness; 42 μ pre flight to 70 μ post flight. **Fundus and optic disc imaging did not show presence of observable disc edema-choroidal folds may be an early sign of elevated ICP which precedes papilledema (important to obtain accurate in flight measurement of choroidal fold development-OCT)**

PanOptic Ophthalmoscope

Raised Intracranial Pressure-Qualitative Measurement?

Elevated ICP transmitted to optic nerve

Cross -Sectional Area of Optic Nerve and Sheath

- Optic nerve x-section (post-mortem) from patient with papilledema.
- Large space, filled with web-like strands of arachnoid between nerve & nerve sheath.

Ocular Sonography

- Image optic nerve and nerve sheath with ultrasound
- Optic nerve sheath diameter (ONSD) → ICP
- Gives broad sense of increased ICP versus normal
- No reliable linear relationship

Kimberly HH, Shah S, Marill K, Noble V. Correlation of optic nerve sheath diameter with direct measurement of intracranial pressure. Acad Emerg Med 2008;15:201-4.

In Flight B-scan Ultrasound

Optic Nerve Sheath Diameter

- Generally accepted that $ONSD > 5 \text{ mm} \approx ICP > 20 \text{ cm H}_2\text{O}$

Geeraerts T, Merceron S, Benhamou D, Vigue B, Duranteau J. Non-invasive assessment of intracranial pressure using ocular sonography in neurocritical care patients. Intensive Care Med 2008;34:2062-7.

Case Report 4 - Increased Optic Nerve Sheath Diameter On-Orbit

Case Report 5: MRI Globe Imaging

T1 MRI orbital imaging of the right eye. Pre flight (left) and Post flight (right) showing flattening of the posterior globe.

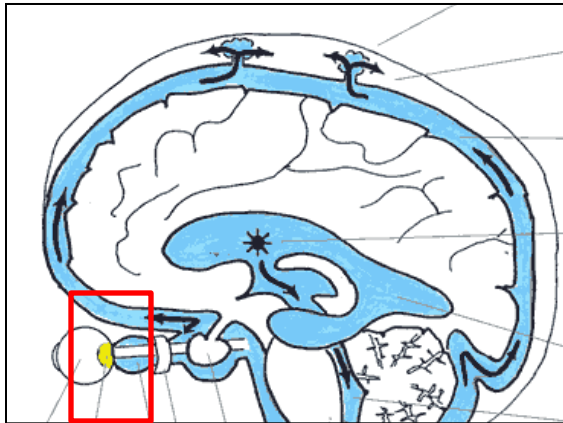

CASE Report 4 - Flattening of Posterior Wall - and Raised Optic Disk

Elevation of optic disc

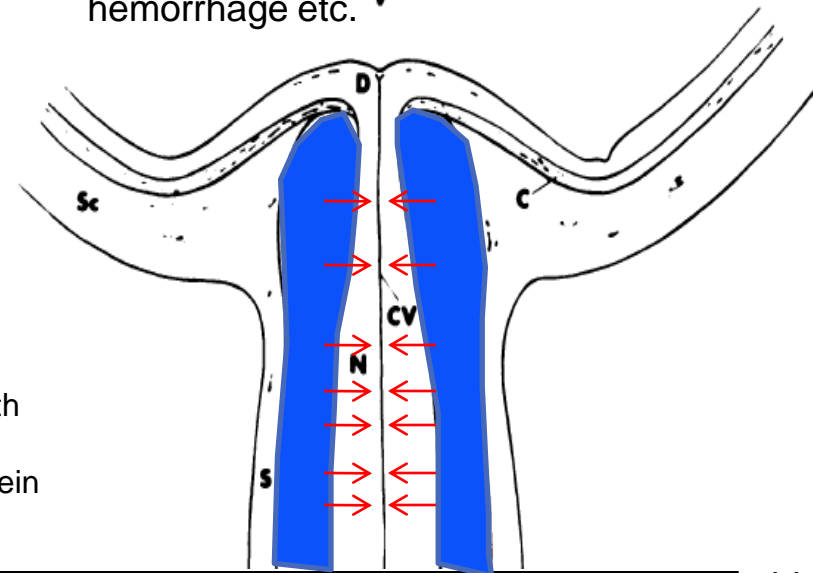

Ocular Venous Hypertension via Optic Nerve Compression

- Increasing ICP transmitted to optic nerve via CSF space causes compression of central retinal vein
- Arterial blood continues to flow into eye but venous drainage impaired
- Result= venous hypertension, optic disc edema, disc protrusion, globe flattening & retinal engorgement, hemorrhage etc. ^v

V-vitreous
 D-Disc
 Sc-sclera
 C-Choroid
 A-Arachnoid space
 S-Optic nerve sheath
 N-Optic Nerve
 CV-Central retinal vein

A. Normal distal optic nerve/sheath complex & head in longitudinal cross section

B. Papilledema showing enlargement of subarachnoid space & compression central retinal vein (CV)

Measurement of Intraocular Pressure with Applanation Tonometry

Dr. Story Musgrave conducting tonometry on STS 44

Elevated ICP-Is it Transmitted to the Eye?

Ventriculus lateralis pars centralis
 Sinus sigillata superior
 Foramen parietale
 Sinus sigillata inferior
 Sinus venosus inferior

Also transmitted to eye via ophthalmic veins

MRI Brain Venogram

Impacts

- ❑ Elevated intracranial pressure and vision disturbance in spaceflight are serious health risks to the astronaut population.
 - ❑ Much longer missions are being planned that will subject personnel to even greater periods of microgravity and hence prolonged exposure to elevated IOP and/or ICP.
- ❑ VIIP Risk team formed with membership from Med Ops and HRP.
 - ❑ Current plan for HRP content is to work via project team within HHC.
- ❑ High-level research plan in development
- ❑ What are the physiological causes?

VIIP Risk - Med Ops and Research

- Summit held February 8-10 with national and international experts in ophthalmology, neuro-ophthalmology, neurosurgery, neurophysiology, and cardiology.
 - Obtained suggestions for current pre, in, and post-flight operations as well as research areas with respect to detection, monitoring, treatment, imaging, susceptibility, computer modeling, and/or use of analogs.
- Results from the summit further reinforced the existence of multiple contributing factors with no clear cause identified. While Medical Operations approaches from a clinical perspective, research is needed to further quantify and mitigate the risk.
- The NASA HRP has added this risk to its portfolio and established the VIIP Project within the Human Health Countermeasures Element.

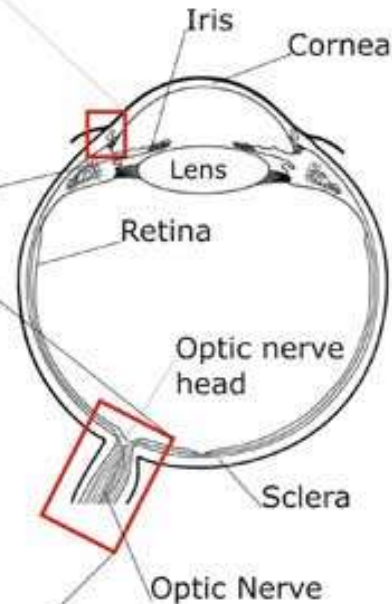

Tissues Involved in Glaucoma

TM = trabecular meshwork
 SC = Schlemm's canal
 JCT = juxtacanalicular tissue
 IW = inner wall
 OW = outer wall
 LC = lamina cribrosa

Lamina cribrosa, en face view

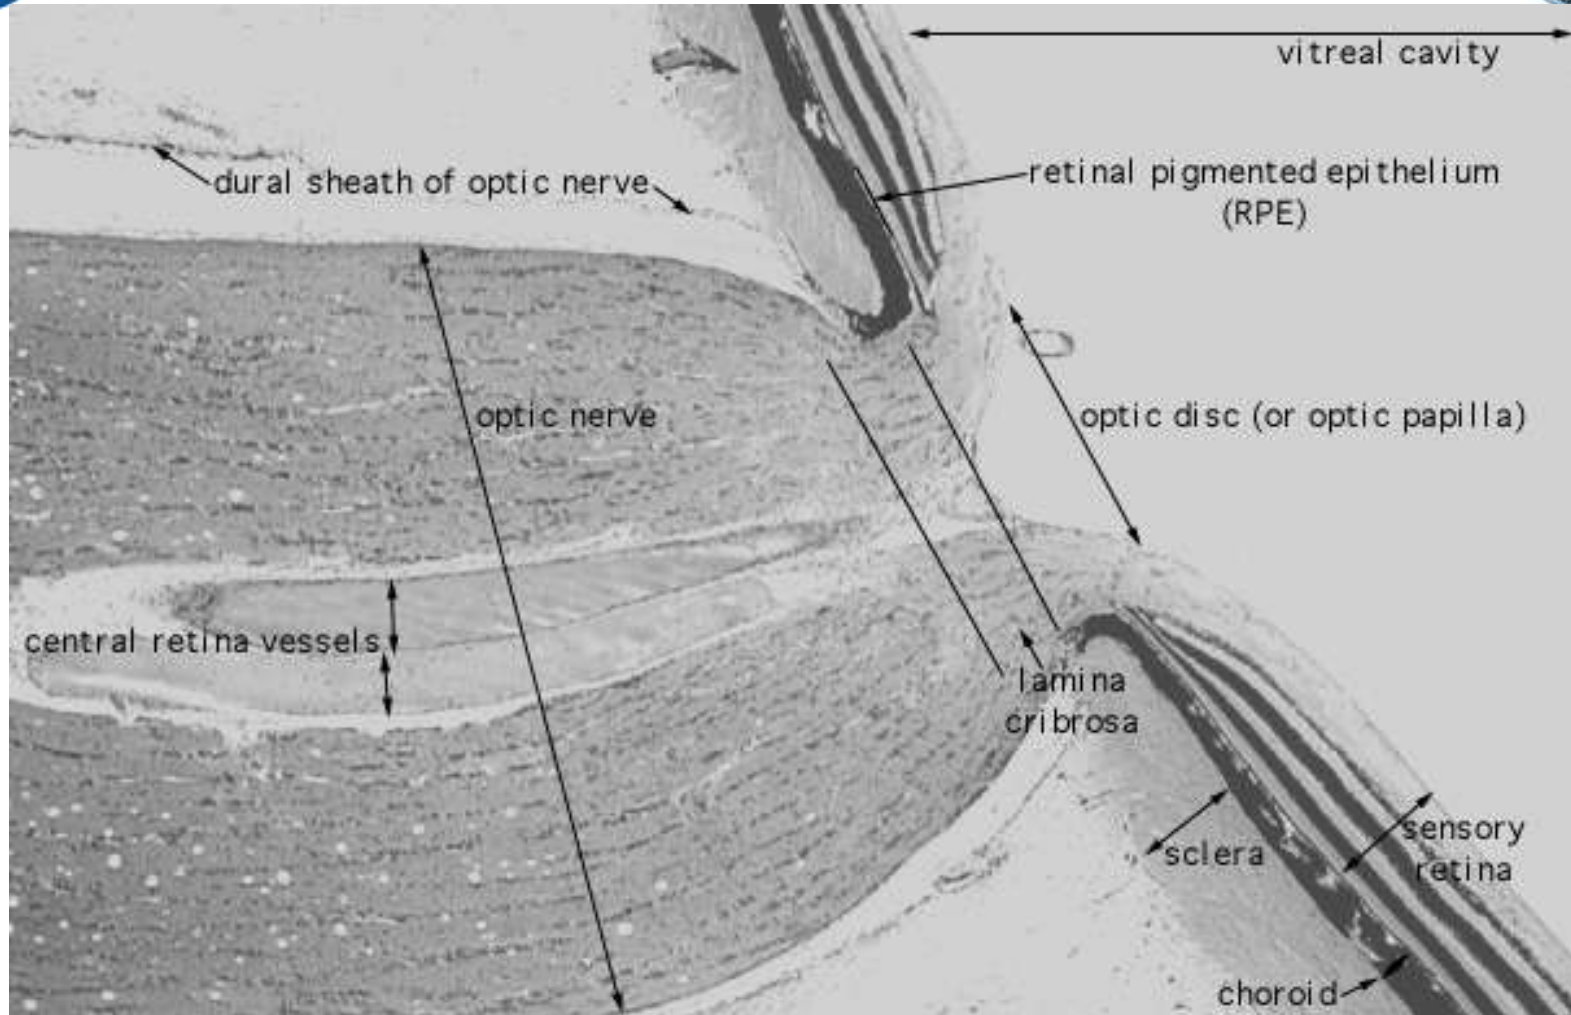

Posterior Eye & Optic Nerve Anatomy

The Lamina Cribosa: Barrier Between the Intraocular Space and SAS

The LC serves as a barrier to separate the intraorbital space, with typically higher pressure, from the subarachnoid space, with typically lower pressure. The LC therefore prevents orbital contents from leaking into the subarachnoid space

Lamina Cribosa Structure

- LC is a series of cribiform plates, with pores that line up to permit nerve axons to pass through
- LC cores are filled with fibrillar collagen and elastic fibres, during aging constituents are altered
- LC becomes stiffer and thinner, thus ability to support nerve axons passing through is compromised especially around the ages of 40-50 years

Myopes put Greater Shear Stress on LC Higher Risk for Glaucomatous Changes

Stress on any part of ocular shell related to IOP and radius of structure: $\sigma = PR/2t$

σ = circumferential stress

P = IOP

R = radius of curvature at that part of the globe

T = thickness

Thus, in myopic eyes when LC is cupped, radius is larger, and stress is greater

Lamina Cribosa: Normal vs Myopic

Normal Eye

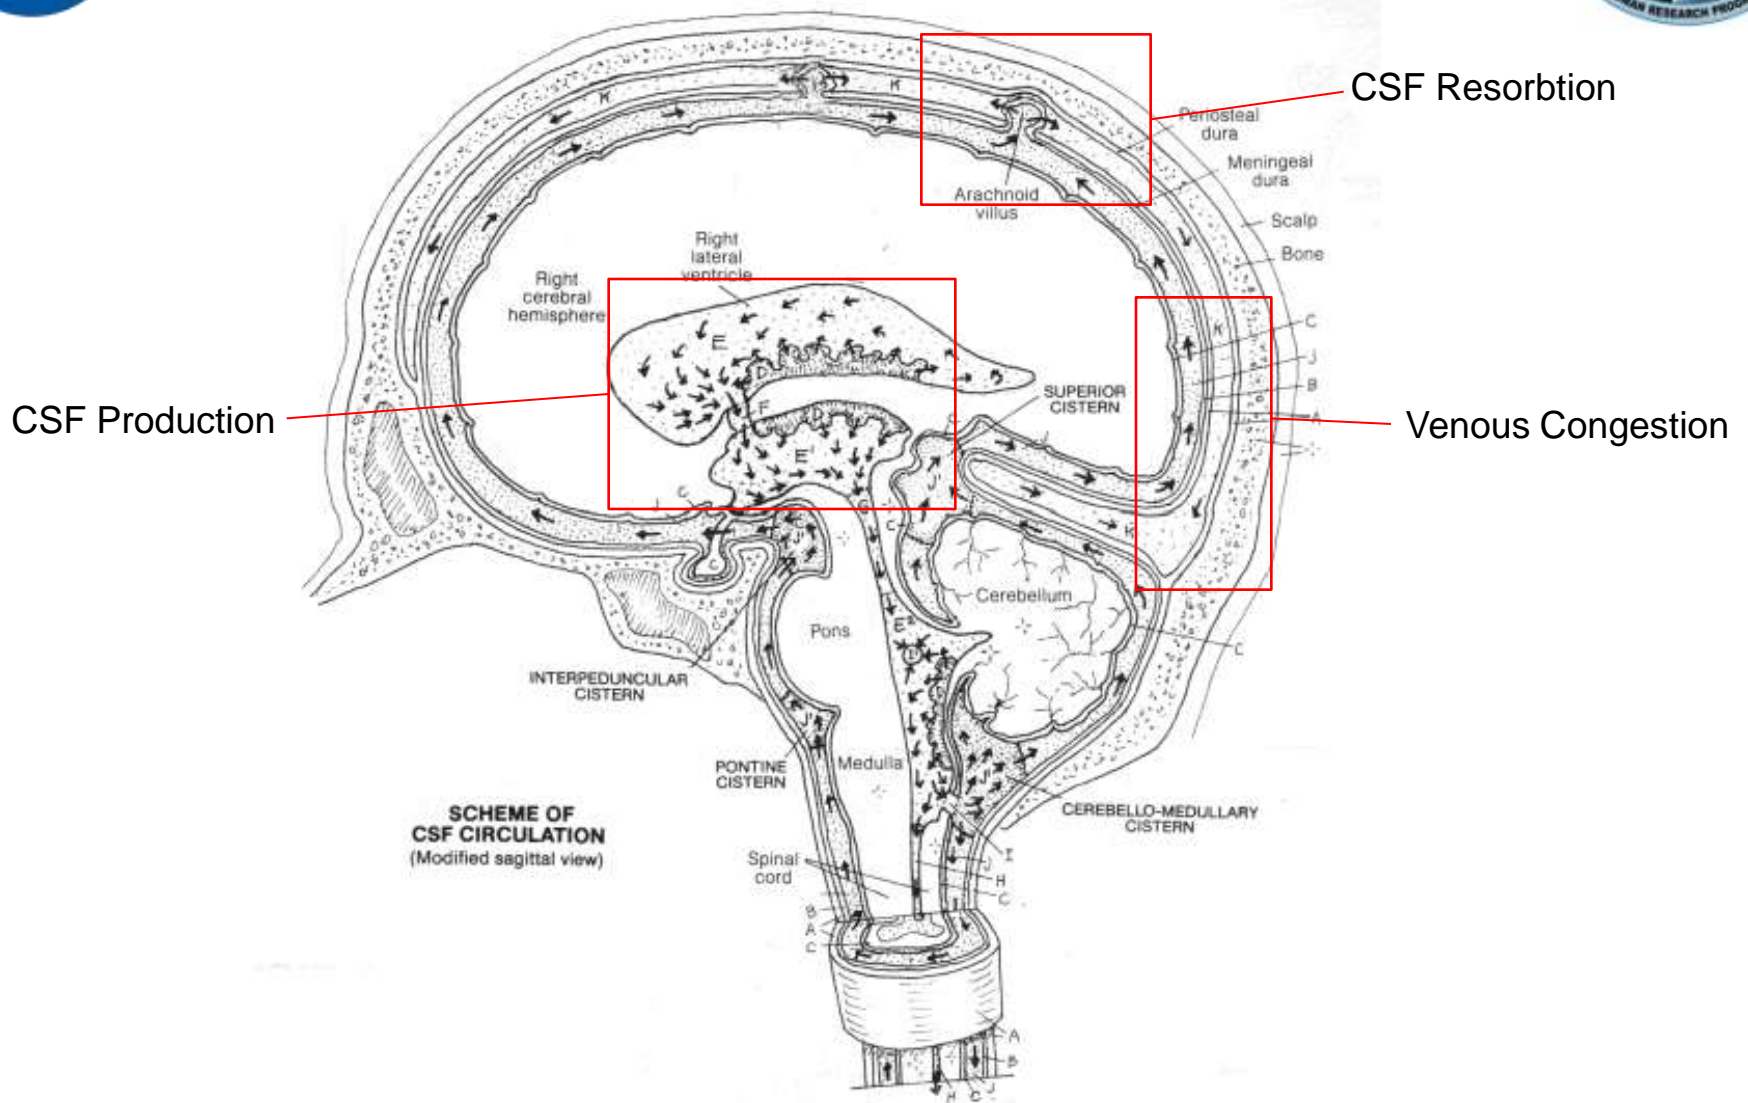

Myopic Eye

- Shear stresses are dominant, and maximal at the periphery owing to the greater curvature in myopic eye
- LC increases in stiffness with age='decreased compliance' means higher likelihood of permanent deformation and at lower pressures
- Change in mechanical compliance most marked after 40-50 years of age, same age incidence of glaucoma increases.
- Any elevation in deformation pressure, even transient, may result in permanent shape

Key Brain Areas

CSF Production: Choroid Plexus

Choroid plexus in lateral, third & fourth ventricle produces 70-90% of CSF in brain

Increased filtration?

Choroidal Cell Responses in Microgravity-Atrial Natrietic Peptide

Normal Control Choroid Cell

- ANP neurohormone
- In CNS when ANP activated, decreases CSF by inhibiting Na-K-ATPase proteins in cerebral capillaries
- Increased ANP binding sites 1.5-2.5x in HLU rat studies

Immunodetection of (red) Na-K-ATPase at the apical pole of choroid plexus (B) in a control rat (D) in a ground-based model simulating cephalad fluid shift

Ground Control 1G

OG & Hind Limb Unloaded

Choroidal Cell Responses in Microgravity- Aquaporin-1 Expression

Ground Control 1G

Normal Control Choroid Cell

Immunodetection of aquaporin 1 (in green) at the apical pole of choroid plexus,
(A) in a control rat (homogeneously covered with long bulbous apical microvilli, and tufts of kinocillia)

0G & Hind Limb Unloaded

Abnormal 0G Analog Choroid Cell

(C) in a model simulating cephalad fluid shift. AQP1 was reduced 64% after 14d spaceflight (STS-58), by 44% after 14 days HLU, and by 68% after 28d HLU.

A net decrease was noted at the epithelial cells, suggesting that CSF production was decreased. Loss of microvilli, failure of exocytosis, loss of kinocillia

Suggests brain adaptation in microgravity with a reduction in CSF secretory activity.

Overshoot of AQP-1: A Mechanism for Elevated ICP Post Flight?

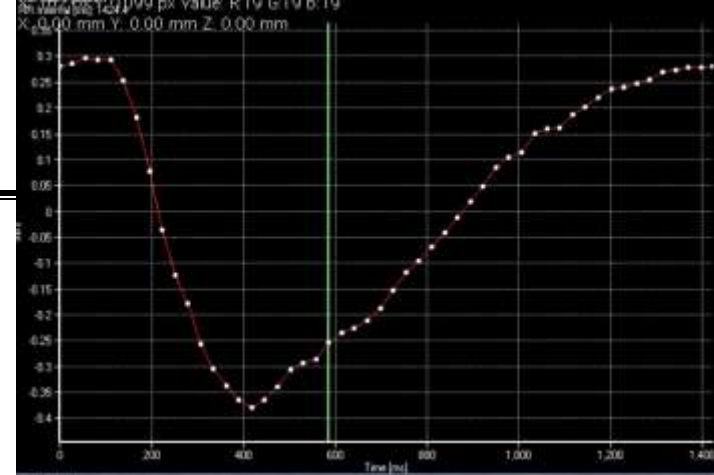

- Once rats returned to 1G, at 2 days readaptation, AQP1 expression was 48% greater than control rats
- In the 14d HLU rats there was a 57% increased expression in AQP-1 after 6 hours readaptation, compared to controls
- Could over-expression of AQP-1 upon return to 1G be a mechanism for the persistently elevated ICP seen in some crew members?

Flow analysis of CSF through the aqueduct

- The flow analysis of CSF through the aqueduct (axial oblique section noted as dashed line --Bottom).
- A CINE phase contrast sequence obtained perpendicular to the mid cerebral aqueduct showing velocity versus time after the QRS wave (graph --- top left) Case #5:
 - R+30: CSF production rate=**305** ul/min
 - CSF peak velocity=**3.65**cm/s
 - R+57: LP opening pressure=28.5
 - R+180:CSF production rate=**682** ul/min
 - CSF peak velocity=**7.80**cm/s
 - Normal CSF production 150-270 ul/min
- Cross sectional image through the mid cerebral aqueduct (Middle) showing the area of flow analysis
- T1 weighted mid sagittal image (Bottom) showing plane of section through the mid cerebral aqueduct
- There is no obvious narrowing of the cerebral aqueduct. CSF production rate is approximately one standard deviation above average in several cases

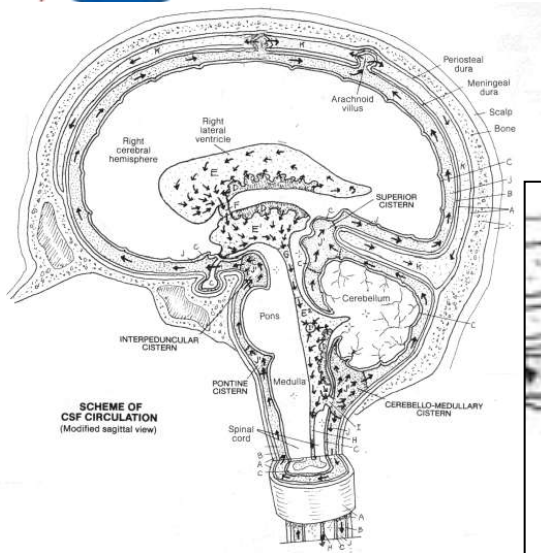

Normal CSF Diffusion Gradient

Normal SSVP:CSFP= 0.60

Therefore delta driving pressure only~3-5mmHg

Risk Background - Intracranial Pressure

As SSVP:CSFP increases, approaches 1.0
Driving pressure falls < 3-5 mmHg and decreased CSF absorption

MRI Brain Venogram

CSF Resorption: Arachnoid Granulations

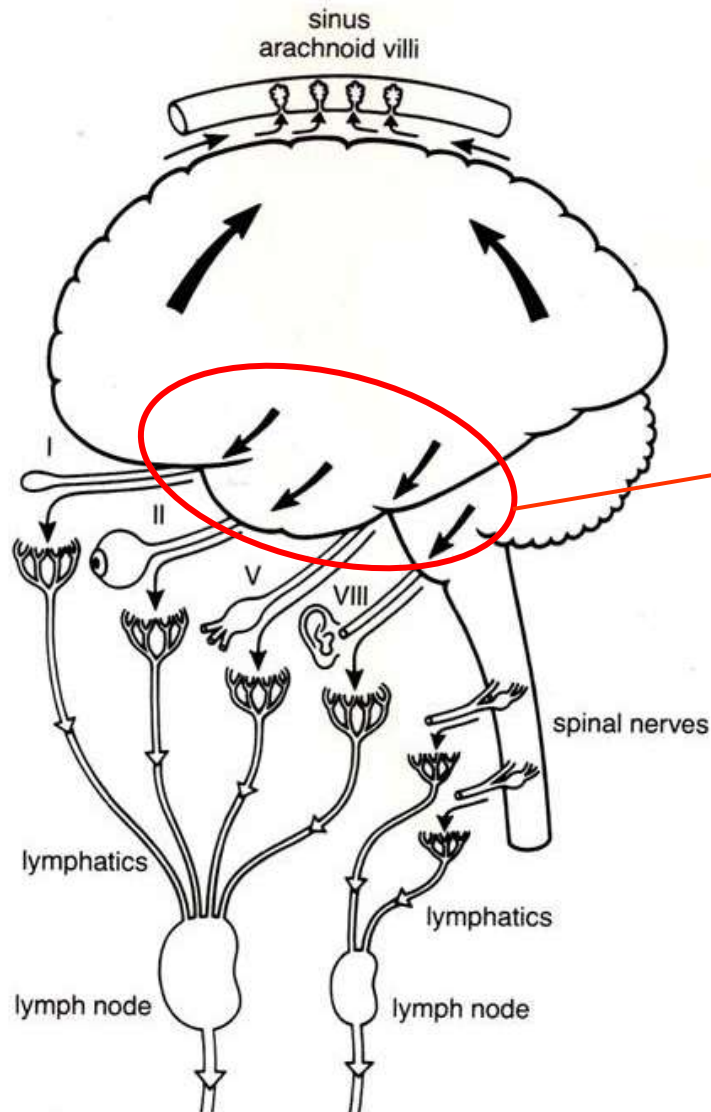

Electron Micrograph of clustered arachnoid granulations from the floor of the superior sagittal sinus. Arrows pointing to lobules

Inflammation of the arachnoid villi as one mechanism inhibiting resorption?

Blocked Lymphatic Drainage of CSF

Perineural pathways along cranial nerves for subarachnoid CSF-lymphatic connections may become congested decreasing absorption (thin curved arrows)
Low pressure system

Exacerbating Factors?

Strength training may cause potentially damaging transient spikes in ICP

Carbon Dioxide

Normal Sea Level CO₂=0.0314%

Main symptoms of Carbon dioxide toxicity

Volume % in air	
■	- 1%
■	- 3%
■	- 5%
■	- 8%

Visual
- Dimmed sight

Auditory
- Reduced hearing

Central
- Drowsiness
- Mild narcosis
- Dizziness
- Confusion
- Headache
- Unconsciousness

Respiratory
- Shortness of breath

Muscular
- Tremor

Skin
- Sweating

Heart
- Increased heart rate and blood pressure

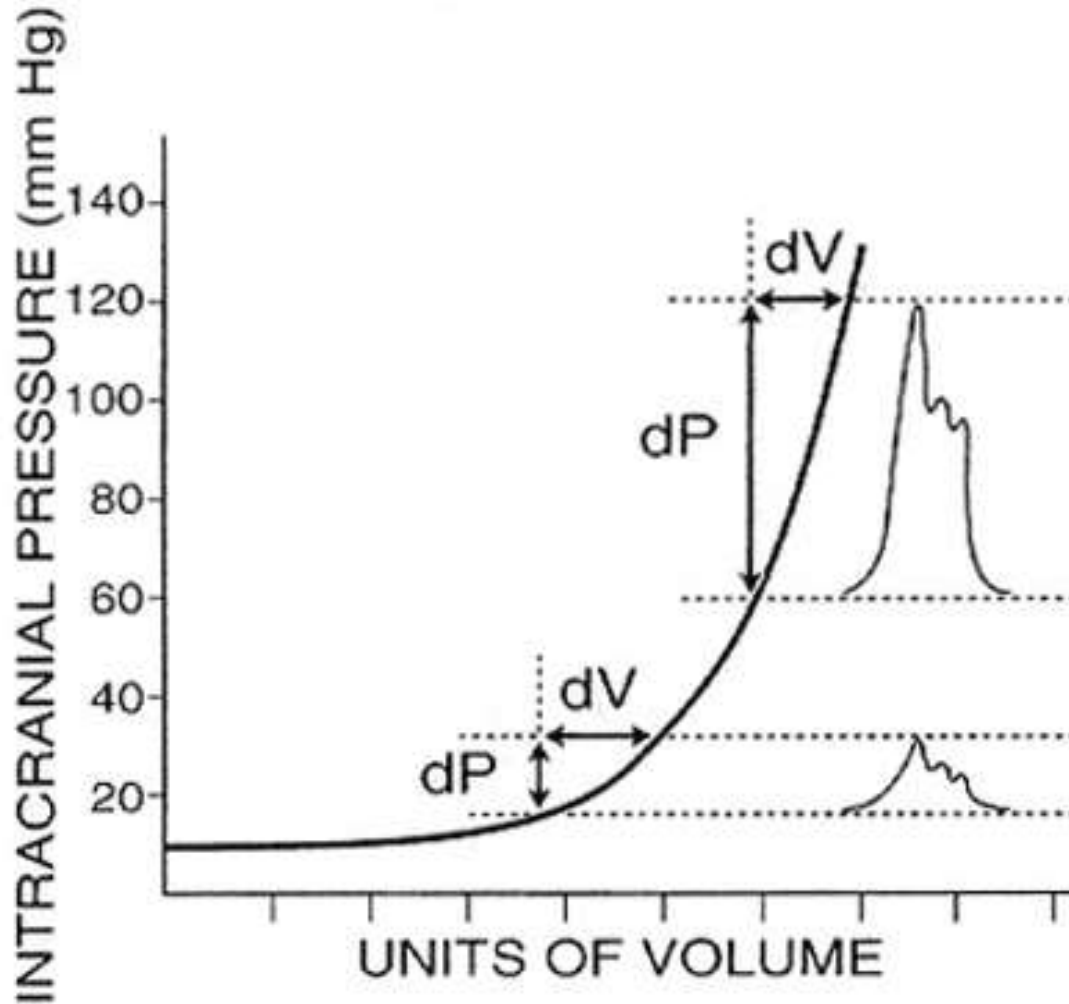

CO₂ on ISS

- CO₂ level mission average=3.56mmHg (0.33%)
 - Ten times normal atmospheric
 - (Normal sea level atmospheric CO₂=0.0314%)
- No mission under 2.0mmHg
- Average Peak CO₂=8.32mmHg (0.7%)
- CO₂ potent vasodilator
- Cerebral CO₂ autoregulation not changed in microgravity.¹
- Causes increased blood flow
 - Every 1mmHg increase PaCO₂=4% increase in cerebrovascular dilation
 - Problem-cerebral blood vessels are already congested
 - Thought to be contributory to the symptoms occurring at lower levels.
 - Causes increased CSF production.

Compliance: Intracranial

CO2 Symptoms in Space

- Symptom onset 1.3-1.6mmHg
- Primarily noted to be headache and visual changes.
- When CO2 level dropped headaches dissipate
- Noted onset at levels far lower than terrestrially i.e.
- Mission Control personnel noticed behavioral changes had occurred at lower levels in crewmembers. Procedural errors, unwarranted comments from crewmembers, and increased “aggravation”
- EVA crewmembers “felt better” post initiation of Oxygen pre-breath and donning the suit (100% O₂ and 4.3 psi environment).

Pre-Flight MRID 1.10 (L-180 - L-30)

All Long Duration crew members

Previous

- Refraction
- Near and far visual acuity
- Tonometry
- Automated visual fields
- Dilated Fundoscopy
- Contact lens/spectacle storage plan
- Amsler Grid
- Retinal photography
- Extraocular muscle examination
- Spectral domain optical coherence tomography (OCT)
- Pupil reflex
- Biomicroscopy
- A-Scan Ultrasound

Additional

- PanOptic video fundoscopy baseline and training
- 3T orbital MRI with contrast
- 2-D imaging ultrasound baseline and training

Red = currently performed as per existing MRID

Blue = currently performed, but are added to new MRID

In-Flight MRID 1.10 (L+30, R-30, L+100) All Long Duration crew members

Previous

Additional

➤ **None previously required per MRID**

L+30 and R-30, potentially at L+100

- Near and far visual acuity
- Amsler grid
- Questionnaire
- Tonometry
- Dilated PanOptic video fundoscopy exam
- Remotely guided HRF eye ultrasound

Post-Flight MRID 1.10 (R+ 0- R+3 or ASAP) All Long Duration crew members

Previous

- Near and far visual acuity
- Tonometry
- Pupil reflex
- Extraocular muscle examination
- Biomicroscopy
- Questionnaire
- Amsler Grid
- Dilated Fundoscopic exam
- Automated visual fields
- Refraction
- Retinal photography
- Spectral domain optical coherence tomography (OCT)
- A-Scan Ultrasound

Additional

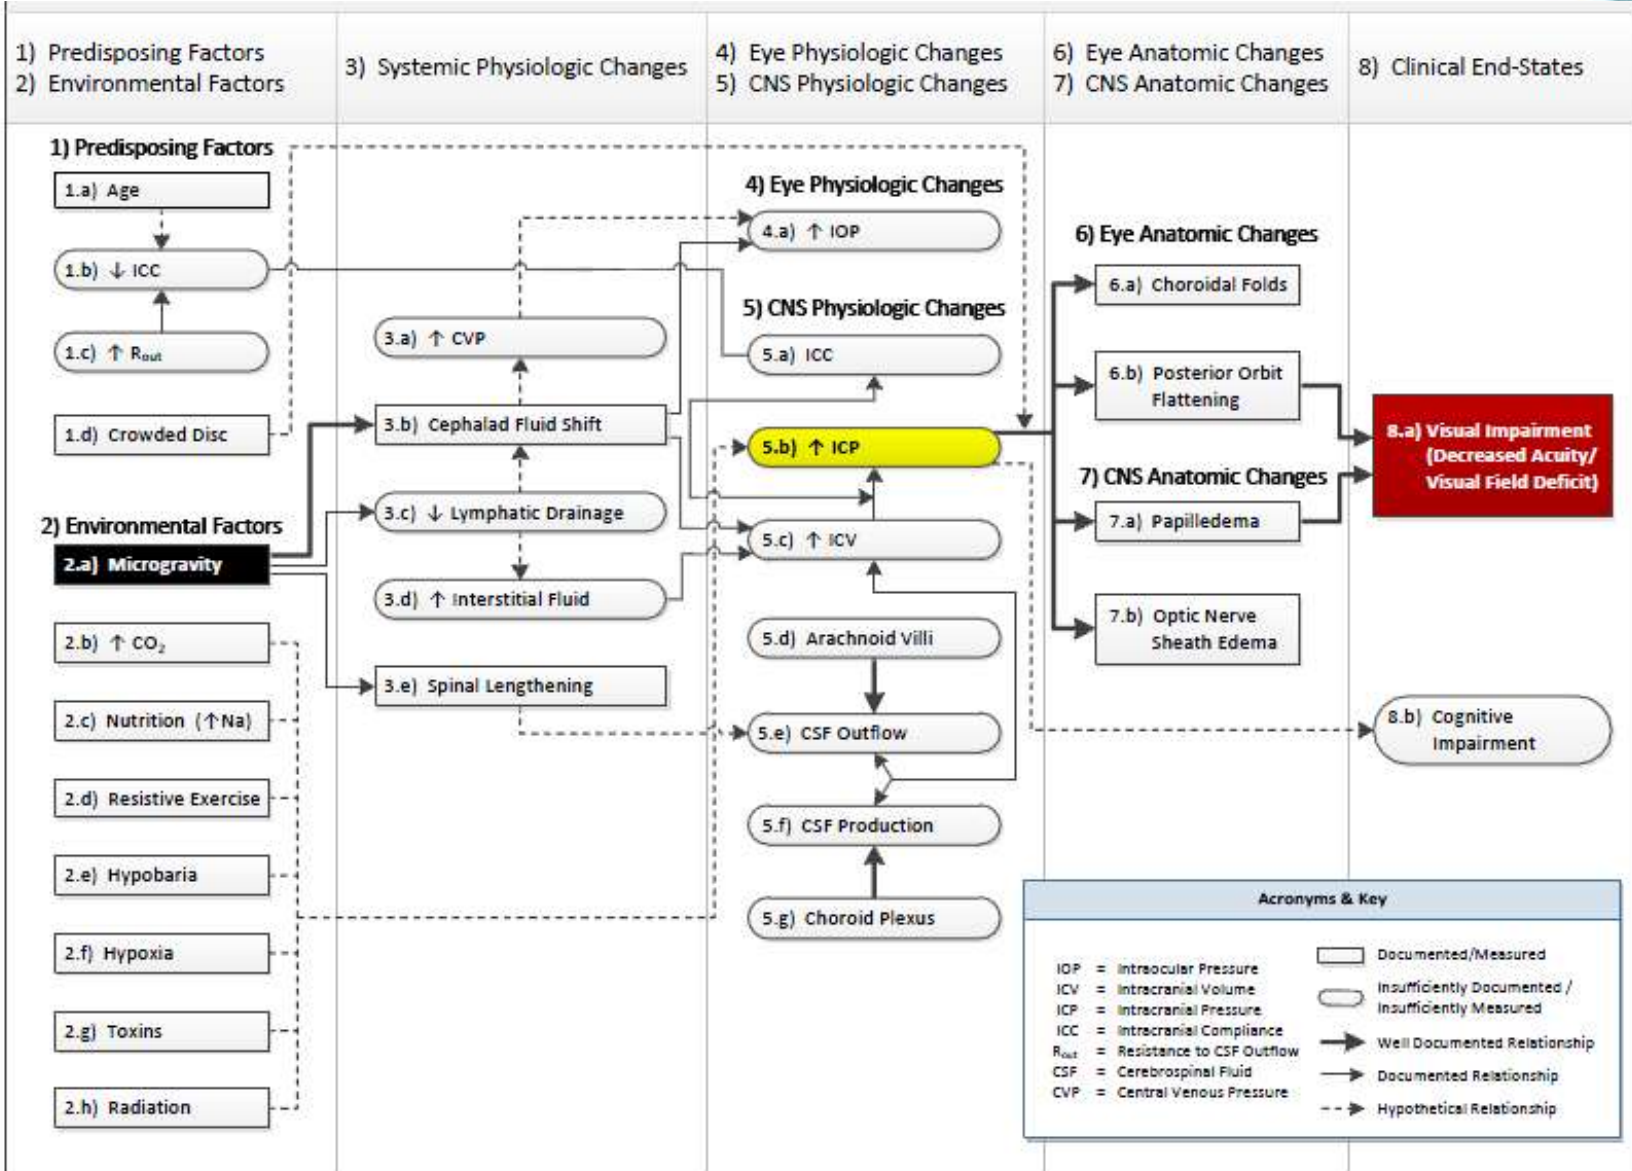

- 3T orbital MRI with contrast
- 2-D imaging ultrasound

Red = currently performed as per existing MRID

Blue = currently performed, but are added to new MRID

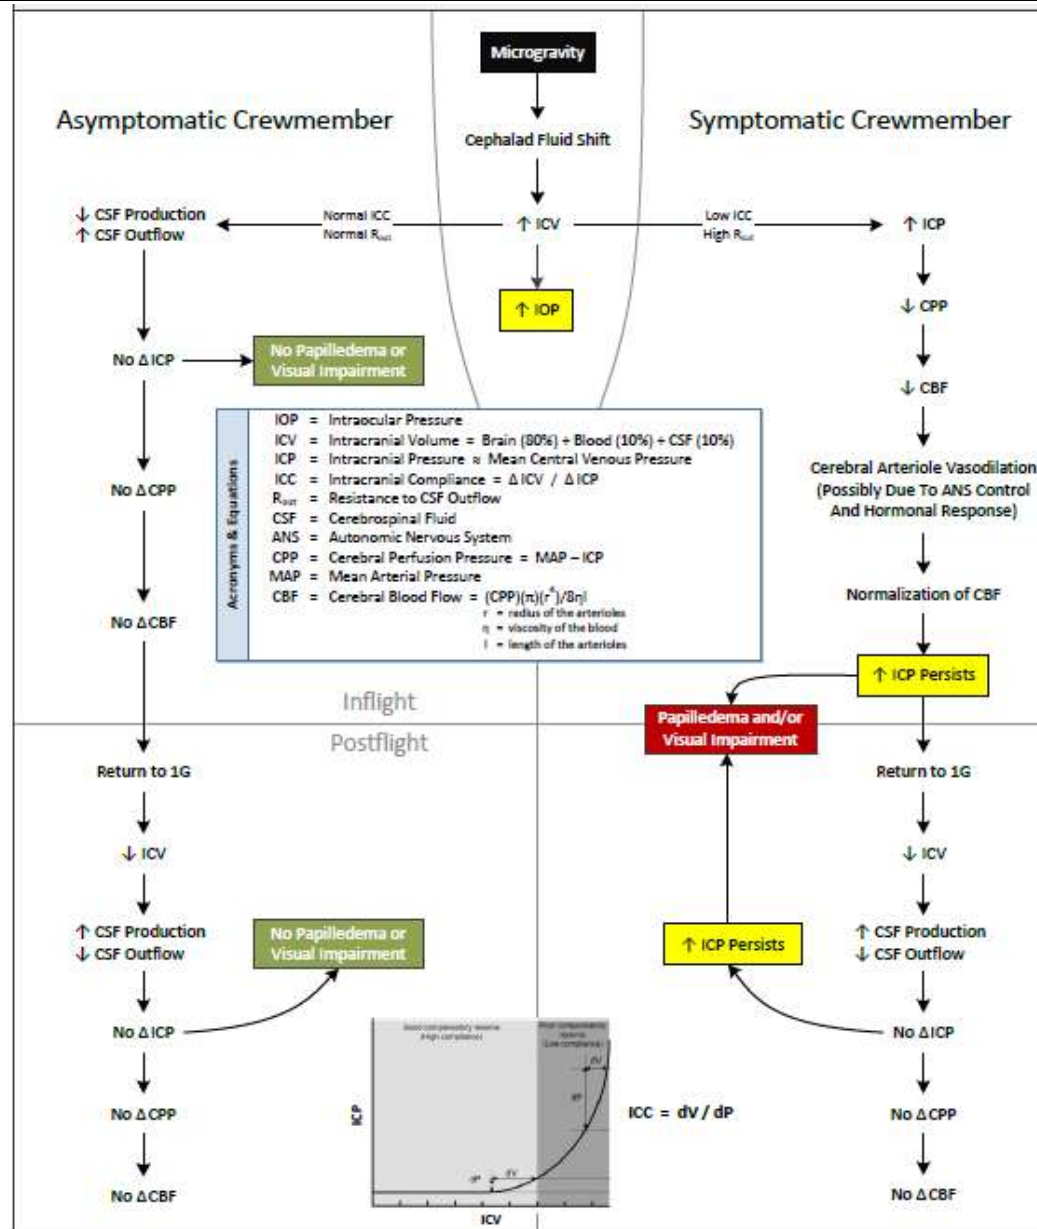

Visual Impairment and Intracranial Pressure Flow Chart

Hypothesized Mechanisms of Cerebral Blood Flow Autoregulation Inflight and Postflight for Asymptomatic and Symptomatic Crewmembers

VIIP Knowledge Gaps

- Gaps (VIIP1) What is the etiology of visual acuity and ocular structural and functional changes seen in-flight and post-flight?
- Gap (VIIP2) Does exposure to microgravity cause changes in visual acuity, intraocular pressure and/or intracranial pressure? Are the effects related to mission duration?
- Gap (VIIP3) What in-flight diagnostic tools are needed to measure changes in intraocular pressure and intracranial pressure?
- Gap (VIIP4) Are changes in visual acuity related to changes in chronic choroidal engorgement, elevated intraocular pressure and/or intracranial pressure? Gap
- (VIIP5) Do multiple or cumulative exposures to spaceflight increase the risk of changes in visual acuity, intraocular pressure or intracranial pressure?
- Gap (VIIP6) How do changes in vascular compliance/pressures influence intraocular pressure or intracranial pressure?
- Gap (VIIP7) Is intracranial hypertension and visual impairment an all or nothing phenomenon or a continuum of severity that occurs in all individuals during spaceflight?

VIIP Knowledge Gaps

- **Gap (VIIP8) What is the role of the ISS environment (e.g. high salt diet, CO₂ pockets, pharmaceutical use, exercise countermeasures) on ocular structure and function and intracranial pressure?**
- **Gap (VIIP9) What is the time course for recovery of intracranial hypertension and visual impairment and do anatomical structures of the eye recover? What factors determine the rate of recovery?**
- **Gap (VIIP10) Are asymptomatic crewmembers with anatomic eye changes or low grade intracranial hypertension at risk for future visual impairments?**
- **Gap (VIIP11) Does long-term, low grade intracranial hypertension predispose individuals to disease processes other than what manifests in the eye?**
- **Gap (VIIP12) Are there suitable ground-based analogs to study this spaceflight-associated phenomenon?**
- **Gap (VIIP13) Can safe and effective countermeasures be designed (in-flight and post-flight) to mitigate changes in visual acuity, intraocular pressure and intracranial hypertension if a problem it exists?**

Forward Research-Possible Countermeasures: Braslet

Рис. 3.12 Браслет-М

Braslet (left): 1 - belt; 2 - pull-up strap; 3 - compression cuff; 4 - tightening strap; 5 - compression scale
Braslet-M (right): 1 - compression cuff; 2 - tightening strap; 3 - compression scale

Russian-US ISS Braslet Study

Femoral Vein Images with and without Braslet Applied

Internal Jugular Vein vs Breathing Manouvers With & Without Braslet

No Braslet

No maneuver

Valsalva

Mueller

With Braslet

Internal jugular vein cross sections with and without Braslet applied, with breathing maneuvers: With Braslet application the internal jugular vein responds to Valsalva with smaller changes, and with Mueller maneuver the vein almost completely collapses.

Combining Countermeasures?

Aerobic exercise may be protective as it draws cephalad fluid caudally into lower limbs

Countermeasures for Arterial *and* Venous Circuits?

Rat Basilar Artery:

- A. Control
 - B. 14d Hindlimb Unloaded
- Cerebral artery Hypertrophies with Cephalad fluid shift*

Circulatory System, Arterial and Venous

Braslet good for sequestering venous volume on lower limb venous capacitance vessels

Venous

Rat Hindlimb Skeletal Artery:

- A. Control
 - B. 14d Hindlimb Unloaded
- Hindlimb skeletal artery atrophies with Cephalad fluid shift*

Braslet DOES NOT prevent upper body arterial circuit from seeing elevated pressures, nor lower body arteries from seeing decreased pressures.
 Is there an additional technology that could assist?

Chibis LBNP Device

ISS008E21918

Chibis LBNP Device

Components:

- Chibis suit (ПБК-1)
- Chibis suit pressure control unit (ПБК-Д)
- Hose harness in kit
- ПБК-1 removable waist seal curtain in kit

Risk Mitigation

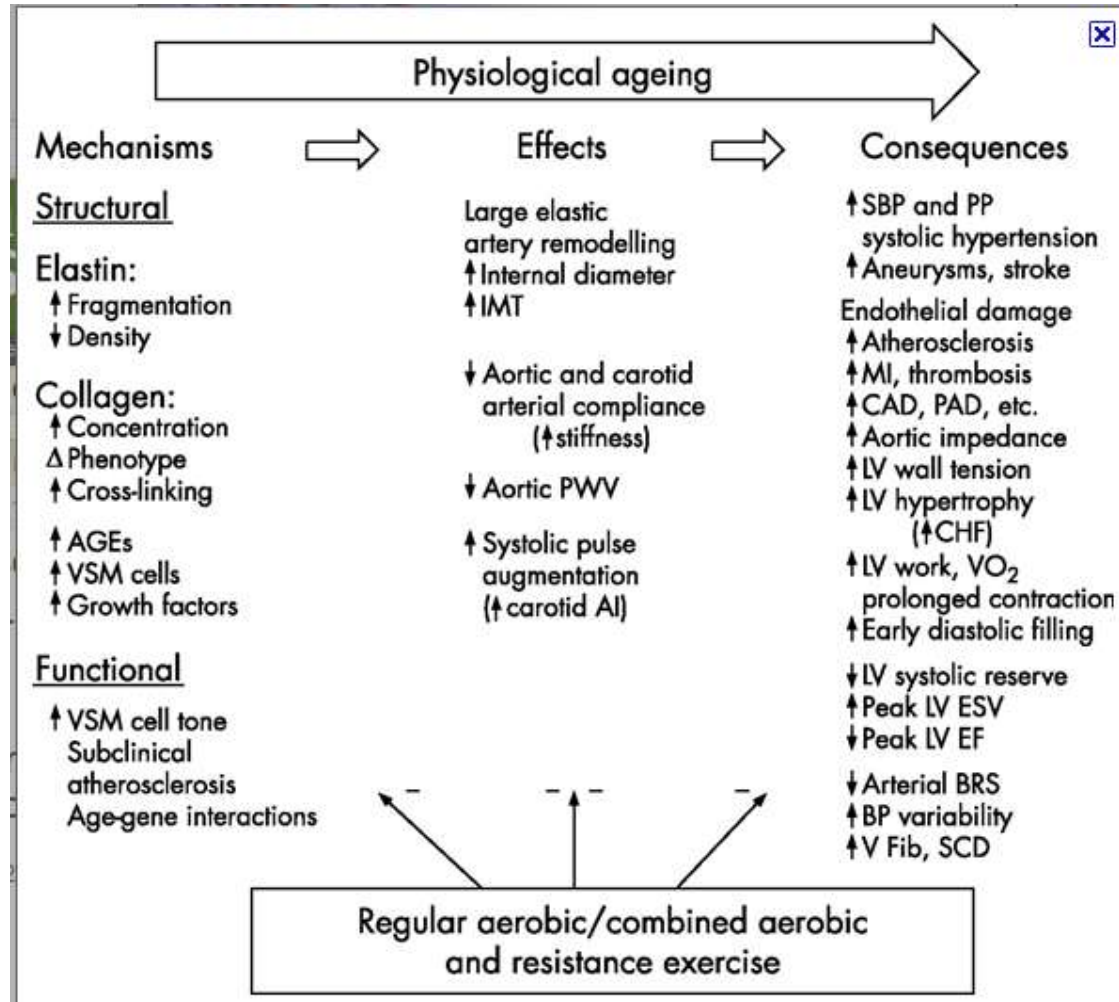

Compliance: Vascular

Preliminary review of data for affected crew members reveals that blood pressure, serum lipids and homocysteine may be elevated compared to those non-affected. Also, maximal aerobic oxygen uptake may be lower in those affected.

Exercise Protective?

Proposed Pre/In/Post-Flight VIIP Research Testing

Acceptable up to L-365 days	L-90/45 days	L+30 & R-30, L+100 if requested (+/- 7 days) & as clinically indicated	L+10, 30, 60, 100 & R-30, (+/- 7 days)	R+1 to R+3 (or as soon as possible)
