**Abstract** The Solar Dynamics Observatory (SDO) Education and Public Outreach (E/PO) program began as a series of discrete efforts implemented by each of the instrument teams and has evolved into a well-rounded program with a full suite of national and international programs. The SDO E/PO team has put forth much effort in the past few years to increase our cohesiveness by adopting common goals and increasing the amount of overlap between our programs. In this paper, we outline the context and overall philosophy for our combined programs, present a brief overview of all SDO E/PO programs along with more detailed highlight of a few key programs, followed by a review of our results up to date. Concluding is a summary of the successes, failures, and lessons learned that future missions can use as a guide, while further incorporating their own content to enhance the public's knowledge and appreciation of NASA's science and technology as well as its benefit to society.

*Keywords: Solar Dynamics Observatory, Education and Public Outreach*

## 1. Introduction

This paper provides an overview of the education and public outreach (E/PO) program associated with the SDO mission. Reflecting on our efforts leading up to launch, we will provide insight into the programs developed, the lessons learned, and provide a model for future missions to build on.

Many stakeholders (NASA, Department of Education, National Research Council, etc.) understand the inherent value of imbedding E/PO programs into missions and scientific research environments. The close connection to the science and data coupled with the co-operation between scientists and education specialists is imperative to successful engagement of the public and fostering their curiosity (NRC, 2011). NASA and the Heliophysics Science Division (HSD) have responded by making E/PO an integral part of every science mission.

In this section, we begin by presenting the state of science literacy and education in the United States and how NASA and the HSD at NASA is choosing to address needs for improving science education.

### 1.1. US Ranking in Science, Technology, Engineering, and Mathematics

For the past decade, US pre-college students have trailed their peers in other countries in their literacy levels and science and math scores. A recent Organization for Economic Co-operation and Development (OECD) report showed that the US ranked 31 in mathematics performance and 23 in science among a major study of 65 countries (OECD 2011). The resulting low numbers of US students pursuing science, technology, engineering, and mathematics (STEM) higher education degrees means having to fill the nation's STEM related

workforce needs externally. In response, and to fill its own STEM workforce needs, NASA has identified E/PO as one of its priorities.

## **1.2. The NASA E/PO Umbrella**

The NASA E/PO umbrella is continually evolving, often changing its approach and focus. However, the fundamental basics tend to remain the same.

NASA has three main Education goals: (1) strengthen NASA and the nation's future workforce, (2) attract and retain students in science, technology, engineering and math (STEM) disciplines, and (3) engage Americans in NASA's mission (Winterton et al., 2008).

NASA's Strategic Framework describes four main areas of E/PO (NASA, 2007):

- Higher Education: targets undergraduate and graduate students inside and outside of the classroom.
- Formal Education: targets the K-12 system and involves standards based (National Science Education Standards 1996) curricula.
- Informal Education: involves science education settings outside the classroom and is not tied to the National Science Education Standards.
- Public Outreach: includes activities aimed at reaching audiences in their own environments and providing unique opportunities for interacting with significantly larger audiences.

In an effort to support this strategic framework, NASA requires missions to spend a percentage of their total cost on E/PO programs closely tied to its mission. In the past, this amount has varied between 2% and 0.5%. The standard now is about 1% (SMD Science Management Council, 2010). This close link between missions and E/PO programs also helps ensure a tight connection between scientists, engineers, and the education community.

## **1.3. E/PO Within the Heliophysics Science Division**

As part of the Living With a Star (LWS) program of the HSD at NASA, SDO must also align itself with the HSD E/PO goals and strategic communication objectives outlined within the Heliophysics Roadmap that builds upon the framework identified in the previous section. As is true with all science divisions, HSD sees E/PO as a key component of all flight and research programs (Christensen et al., 2009). However, with HSD science in mind, it highly encourages a more integrated set of activities that reflect the system-wide approach to HSD science and how we study the Sun and its effects on the solar system. The four strategic communication objectives as outlined in the roadmap are:

- Seek opportunities to increase and maintain public awareness of Heliophysics science through activities, materials, and events.
- Engage students and sustain their interest in Heliophysics-related STEM subjects.
- Collaborate with and engage educators to enhance their knowledge of Heliophysics-related subjects and activities.

- Build awareness among students, educators, and the public on the diverse range of career opportunities related to Heliophysics science and missions.

## **2. SDO Education and Public Outreach**

In keeping with the NASA Framework, the strategic communications objectives, and the system-wide approach outlined in the Heliophysics roadmap, The SDO E/PO team has developed an overall approach and philosophy by which it has built its portfolio of programs. In this section we will discuss our program strategies, provide a brief overview of our portfolio of programs, and conclude with a more in detail highlight of a select few of our programs.

### **2.1. SDO E/PO Overall Approach and Philosophy**

Our guiding principles include (1) using current educational research and best-practices approach regarding how people learn, (2) addressing misconceptions and changing the perceptions and behaviors of target audiences, (3) developing programs that can serve as backbones to other missions and partners (4) relying on extensive evaluation, and (5) thinking outside the box. We will now expand on each of these.

We develop our programs using current pedagogy and research into “How People Learn” (Bransford et al., 2009) and how best to integrate inquiry into every experience. Inquiry refers to participant activities that help develop the knowledge and understanding of scientific ideas, as well as an understanding of how scientists study the natural world (National Science Education Standards, 1996). Our research guided us to move away from teacher/moderator-centered resources (a model where teachers/moderators lecture to students/participants or run very scripted activities) and to rely instead on learner-centered resources, which are fundamental to effective learning experiences at all ages and levels.

Efforts within the SDO E/PO program aim to improve people’s perceptions and behaviors toward science and scientists. We want to change the common misconceptions that all scientists are, “...white males ... who work alone in a laboratory...” (Barman et al., 1997), “eccentric” (McAdam, 1990), and that science is hard. We have found that the best approach to changing these perceptions is to help scientists connect their work and research with educators and the public. We do so by designing programs that make science more approachable and provide multiple opportunities for audiences to meet and interact with a variety of scientists and engineers. These experiences slowly break down the public’s false perceptions of scientists and make science more accessible. In doing so, we also encourage a change in audience behaviors. Families are encouraged to participate in more science-related activities outside the classroom and our programs.

Programs are developed to serve as models or backbones. This approach provides two benefits: (1) it allows for the development of big picture programs and (2) allows other missions and institutions to easily plug into or adapt the program model to their own needs. This big picture approach to program development aligns with the Heliophysics roadmap desire to build E/PO programs that reflect the system-wide approach to Heliophysics science and ensures the public is able to more easily connect to our story and science. The plug-in model helps ensure sustainability of programs long after missions or small funding sources have run out.

Some form of evaluation is applied at all stages of the development cycle. A small percentage of resources have been allocated to the evaluation of all of our programs to ensure program effectiveness. Some programs have had a much more rigorous evaluation than others. An increased percentage of funds (20% - 30% of cost) have been allocated for evaluation of all post-launch efforts. This will provide us with the tools necessary to understand the effectiveness and impact of our current and future programs.

The SDO E/PO team strives to find new and innovative ways to reach out and share the excitement of the mission with a broad range of audiences. This includes exploring unexpected venues such as the *Did You Know* campaign that placed science factoids on the back of bathroom stalls and drink coasters as well as using social media programs such as Facebook and Twitter to create a personality for the mission. Team members interact daily with followers to build a strong open and active dialogue with the public.

## **2.2. SDO E/PO Portfolio Overview – Higher Education**

The HMI *Space Weather Monitor* program provides authentic space science instruments and hands-on access to data to students in early university (more below). A more sensitive research quality monitor that tracks solar and lightning-induced changes in the ionosphere is available for upper level and graduate programs.

The AIA *Montana Space Public Outreach Team (SPOT)* program trains college students from a variety of disciplines in how to present the latest discoveries in space science and are then dispatched to schools and community organizations around the state of Montana.

The HMI *Science in Service* program aims to instill in college students the necessity for performing public service no matter their future profession. Students from a variety of disciplines are trained in how to be effective science communicators and then connect them to youths in Bay Area communities through science mentorship and after-school science clubs.

## **2.3. SDO E/PO Portfolio Overview – K-12**

The GSFC *A Day at Goddard* field trip brings high school physics classes to Goddard for a day consisting of a facilities tour, a high-tech classroom lab experience, and a career-oriented meet-and-greet with scientists and engineers.

The GSFC *Think Scientifically* is a story-based science literature series that integrates a classic storybook format with fundamental science to make an educational product that can be easily integrated into elementary school classrooms.

The GSFC *SDO Ambassador* program connects SDO scientists, engineers, and E/PO staff with teachers in the DC metro area. SDO Ambassadors visit classrooms for a day to present SDO, participate in a Q&A session and conduct an SDO related hands-on activity.

The GSFC, AIA, HMI, and EVE *SDO Teacher's Guides* are a comprehensive set of Solar and Space Weather related activities developed for use in middle and high school level classes.

The EVE *Solar Science Learning Kit* and associated Teacher Workshops were developed to support high school science courses. They include a collection of materials developed by the SDO E/PO team to bring Solar and Space Weather content into the classroom within the educational standards all teachers must

follow.

The EVE *SDO English as a Second Language (ESL) Space Science Course* was a pilot program aimed at providing ESL students a unique opportunity to participate in science content while helping them bridge between English and Spanish and better integrate into the school system.

The HMI *Sudden Ionospheric Disturbance (SID) Monitors* are part of the *Space Weather Monitor* program noted above and were designed to give students access to authentic research equipment, experiences, and data. The low-cost, high school version of the monitor allows students to track solar-induced changes in the ionosphere.

The AIA *Challenger Learning Center (CLC) Module Update* program integrated a space weather scenario into the “Return to the Moon” and “Voyage to Mars” missions. During the simulated missions, students receive a CME alert from the SDO satellite. In determining if the event is headed towards them, students learn about the magnetosphere, space weather, and solar activity.

#### **2.4. SDO E/PO Portfolio Overview – Informal Education**

The GSFC *Family Science Night (FSN)* program is designed for middle school children and their families. Families explore space science themes through a series of monthly two-hour events aimed at building their awareness of the importance of science in their daily lives.

#### **2.5. SDO E/PO Portfolio Overview – Public Outreach**

The GSFC *Sunday Experiment* is a program for families with young kids designed to provide easy access to age-appropriate science content through easy hands-on activities and an opportunity to meet scientists and engineers.

The GSFC *AstroZone and Exploration Station* are four-hour, free to the public open house, held in conjunction with professional science meetings. The programs offer a variety of easy, family friendly, hands-on activities and an opportunity to interact one-on-one with scientists, engineers, and education specialist.

The EVE *Science Writers’ Workshop* held at the Laboratory for Atmospheric and Space Physics (LASP) prior to the launch of SDO brought 13 journalists from print and new media together with SDO EVE scientists. Workshop themes included: “The Anatomy of the Sun”, “Impact of the Solar Minimum on Climate and the Space Environment”, “What will Solar Max look like?” “Implications for Studying the Sun and for Space Weather” and “Looking to the Future: The Great Observatory”

The EVE created and hosted *Video Series* include an overview of the EVE instrument (“All About EVE”), a virtual tour of LASP, and an overview of various space science careers. Scientists attending the above-described Science Writers’ Workshop were also interviewed about their solar science research and those videos are available on YouTube.

The GSFC and HMI *SDO Social Media Campaign* is comprised of the SDO website, Twitter feeds, Facebook fan pages, YouTube and Flickr channels, and several topic specific blogs. Each effort has been strategically designed and aims to interact with key target audiences in unique and efficient ways helping the mission engage the public in an informal conversation and create a sense of community around the SDO mission.

The GSFC *Did You Know Campaign* focuses on reaching non-traditional audience in unexpected locations by providing solar and space weather related

factoids on signs placed on tables, the back of bathroom stalls and drink coasters.

## **2.6. SDO E/PO Portfolio Overview – Highlights**

The *Space Weather Monitor* program: Studies confirm that the best way to learn science is to do science (AAAS, 1993; Boyer Commission, 1998). Based on this premise, this program was designed to provide authentic, space science instruments to students in high school and early university. The National Science Foundation (NSF) developed Sudden Ionospheric Disturbance (SID) monitors to detect changes to the Earth's ionosphere caused by solar flares. While design of the low-cost instruments had been completed, no formal assessments had been made and the instruments did not come with sufficient teacher-preparation or supporting educational materials. The *Space Weather Monitor* program addressed this shortcoming by forming a team of E/PO specialists and HMI scientists to develop and implement a 4-year test program.

The SID monitors function by tracking Very Low Frequency (VLF) radio transmissions as they bounce off the ionosphere. Solar activity dramatically affects the Total Electron Count (TEC) in the ionosphere and hence affects the refraction of the VLF waves. Students use the monitors to track VLF signal strength, directly related to TEC and the waves' bounce points. The monitors come preassembled, but students "buy in" by designing and building their own antenna. The systems then require a simple PC to record the data and an internet connection to share data [Note – internet is not required as it is generally not easily available in places like Africa.]. The package includes detailed teacher-training materials developed in partnership between the Stanford Solar Center and the Chabot Space & Science Center of Oakland, California, as well as an installation guide and research guide designed to train students to understand their data and encourage them to explore further research projects.

Year-1 beta testing consisted of placing instruments in 3 local (Bay area) schools (2 high schools and 1 community college) with a high percentage of under-served students. Teachers were given direct access to HMI scientists for questions and clarifications. SDO scientists and other volunteers served as Mentors to schools that requested them.

Year-2 was dedicated to creating a centralized data site where SID users could upload their data and to the distribution of over 150 instruments to high schools and universities throughout the US and at selected sites around the world.

In Year-3, the program was picked up by the United Nations for use during the International Heliophysical Year (IHY) where instruments were distributed to about 50 countries with a focus on Developing Nations (Scherrer et al, 2008). The United Nations International Space Weather Initiative (IWSI) selected an enhanced version of the SID monitor as a participating program and instruments continue to be distributed to universities worldwide. Data from the SID monitors has been tested for use in adjusting real-time models of the ionosphere.

In Year-4, the distribution and mentor mechanisms have been successfully handed off to the Society of Amateur Radio Astronomers (SARA) ensuring that the program continues indefinitely in a self-sustaining manner.

The *Family Science Night* program: Parents and families have the greatest influence on children's attitudes towards education and career choices. Research shows that when students have family members involved in their education, they show increased achievement – higher grades, improved problem-solving and cognitive skills (Fan et al. 2001). Based on this result, we in partnership with the

Astrophysics Science Division developed the *FSN* Program for middle school children and their families. Middle school aged children were chosen since they are at an age where interest in science and math can be nurtured and when they are still willing to participate in programs with their families. This program was designed as an informal education program that allows for more flexibility in its content and approach, and a deeper parent/child interaction as it was out of school and not tied to the science education standards.

During the *FSN* program, families explore space science themes through a series of monthly two-hour events. Our goal is to raise awareness in participating families of the importance of science in their daily lives and changing the way families think about science, within the program and beyond. We use NASA science content with a focus on processes and infuse SDO mission science and data into sessions whenever appropriate. We also provide unique opportunities for participants to interact with volunteer scientists and engineers. We provide parent professional development to help parents become effective facilitators of inquiry with their own families and offer opportunities for the children to become comfortable teaching their parents and working with them as peers. Finally, we encourage family science related activities outside of the program.

Years 1-4 were been dedicated to the pilot testing of the program and refining of all facilitator guide materials. Our focus has shifted to the dissemination of the program to various locations across the USA in the year since launch.

The *SDO Social Media* campaign: Through the use of social media the SDO E/PO team is able to engage a much wider audience, as well as engaging more deeply with the audience, than through traditional outlets (e.g. press releases). Elements of our new media plan include the use of online tools, such as Twitter, Facebook, YouTube, blogs, and the SDO website. These services allow not only for dissemination of information, but also for two-way interaction and the building of conversations, crucial to extended engagement of the public and community building.

The NASA\_SDO and NASA\_SDO\_EDU Twitter accounts have opened a constant dialogue between members of the public (i.e. followers) and members of the SDO E/PO, science, and engineering teams. These accounts post information on SDO, the sun, NASA, and interesting developments in the STEM community. Followers can ask questions, comment on postings, and interact with members of the SDO team on a one-on-one basis. During the launch of SDO and First Light–related events Twitter was used to include thousands of people from across the globe in the experience. Fifteen on-site “Twitter Correspondents” were trained to be effective science communicators and interact with those thousands of followers. Our audience included students from Romania, Mexico and Alaska, homeschooled families in Florida and Georgia, and 30 independently hosted events (events organized by members of the public not officially affiliated with SDO) including one in Second Life. For both launch and First Light, the term “Solar Dynamics Observatory” was a trending topic on Twitter for over 24 hours. Twitter defines a trending topic as those topics that are occupying the most people's attention on Twitter at any given time. It is important to note that most trending topics only last between 5-11 minutes and are generally associated with a celebrity or noteworthy news topic.

The Facebook page has an intentionally more playful approach with updates made in the first person, from the satellite's perspective. “Little SDO” interacts daily with its friends and followers around the world and shares a wide variety of

solar and space related information. This approach was chosen to give a personality to the spacecraft and allow followers to connect to it in the same way viewers connected with Disney's Wall-E character.

The YouTube channels stream SDO movies in a format that the public is intimately familiar with, and allows the viewer to easily share videos they find interesting with members of their social circle, while our website provides the background and details of the mission and serves as a resource to the public. The website also provides the public with easy access to the data (images and movies) through a variety of developed browse tools.

### **3. Results**

This section provides a presentation of the results obtained for those programs that performed formal and informal evaluations. Formative assessment is performed throughout a program's development and provides feedback to developers on how to improve a program as it is built. Summative assessment is a final evaluation at the end of a project's life to indicate if it has met its stated goals. Results are shown only for programs with formal and informal evaluation performed. Evaluation efforts for the *Think Scientifically* book series, the *SDO Teacher's Guides*, and various classroom resources including the EVE video series have not yet begun. We are awaiting the final results from the *Science Writers' Workshop*. NASA HQ has put the *Did You Know* campaign on hold due to its perceived flirting with the thin line of marketing. As such, no formal evaluation on the program was performed.

#### **3.1. The Space Weather Monitor Program (SID monitors)**

Extensive formative assessment of the program and materials was done over the 4-year study period, with significant involvement by SDO scientists. California State University graduate student Kim Ross performed formal summative assessment of the program. Surveys were distributed to all the SID installations, with a 56% response rate. Amongst other findings, 78% of respondents rated the program "highly effective" or better for teaching about solar activity and 70% rated the program as "highly effective" or better in conducting a scientific investigation. Summative assessment revealed that about 50% of sites did experience "some difficulty" with installation. The SID program is now successfully self-sustaining. The Space Weather Monitor program was one of only 2 projects highlighted for commendation in the National Research Council's (NRC) report on NASA E/PO program (Quinn, et al., 2008)

#### **3.2. The SPOT Program**

An external Ph.D. student from the Montana State University Education Department provides formal summative assessment of the program. Evaluation of this program focuses on the impact presentations have on students and communities visited. The evaluator examines the teacher-submitted evaluations as well as the training and retention of student presenters via phone interviews. Although the K-12 students are not surveyed for their interest in the presentations, teachers are asked to describe the level of student interest, both during and after the SPOT presentations. Almost three-quarters of the teachers surveyed commented that they could tell the students were interested because of the questions they were asking. This statement from a teacher is typical of these

remarks: *Students asked many questions and were engaged during the program.* Almost one quarter of the teachers indicated that their students continued to talk about the program after the presenters left.

### **3.3. The Science in Service Program**

Formative assessment was carried out for each of the 1<sup>st</sup> four years of the program. Student participants and local community leaders were involved with evaluation discussions after each local visit, and also completed extensive questionnaires at the end of the term. The program was iteratively adjusted when weaknesses were identified. At the end of the 5 years, summative assessment was also carried out. The focus of the final evaluation was to determine whether the program was effective enough to warrant its funding and support by Stanford University. Extensive interviews were conducted, both with participants, involved HMI scientists, and local community leaders. A written report was generated, discussed, and evaluated. The final result of the assessment ensured that Stanford would assume responsibility for running the program and provide on-going funding to assure its continuity. The successful program is now independent of SDO and self-sustaining.

### **3.4. A Day at Goddard**

Magnolia Consulting is performing the ongoing formal evaluation of this program. Evaluation data collection activities for the Day At Goddard field trips include student and teacher feedback surveys. Evaluators designed the student survey to capture students' perceptions of the field trip components, and impacts on their interest and understanding of space science and related careers. Evaluators designed the teacher survey to gather feedback from teachers on the event. Feedback included teachers' perceptions of impacts of the field trip on their students' awareness of careers, interest in space science, and understanding of the work of NASA Goddard Space Flight Center (GSFC) scientists and engineers. Initial results indicate that the events are effective at engaging student interest in space science and provided good exposure to the work of NASA Goddard Space Flight Center. Hands-on activities and interactions with scientists and engineers are particularly engaging for students.

Student survey results indicate that the program is successful in stimulating or maintaining interest in space science and science careers for the majority of students who attended. 48% of students indicated that they were more interested in science careers as a result of the program while 21% indicated that interest was sustained. 54% of students also indicated that they were more interested in space science as a result of the program while 22% indicated that interest was sustained.

Teacher surveys found that 100% of teachers found that activities were effective in increasing students' understanding of the work at GSFC, that activities were effective in generating students' interest in space science, and that activities were effective in increasing students' awareness of STEM careers.

### **3.5. SDO Ambassador**

Magnolia Consulting is performing the ongoing formal evaluation of this program. Data collection activities for *SDO Ambassador* visits include teacher and student feedback surveys. Student feedback surveys include likert-scale items about their perceptions of the event and open-ended items about what they

learned, what they liked best, and what they would change.

Results indicate that the *SDO Ambassador* visit was engaging and educational for students. Of the respondents, 97.7% agreed or strongly agreed that they had fun learning about solar science and that they learned new things about solar science from participating. 93% agreed or strongly agreed that the event made solar science interesting to them while 87.2% indicated that they learned about the Solar Dynamics Observatory from participating. We are awaiting results from the teacher surveys.

### **3.6. The Solar Science Learning Kit and SDO ESL Space Science Course**

Dr. Tim Weston of the ATLAS Assessment and Research Center is conducting ongoing external evaluation of this program. The evaluator conducted interviews with five users of the *SDO ESL Space Science Course*. Interviews focused on perceived learning outcomes of students, fit with existing curriculum, ease of lesson implementation, organization, format and compatibility with state standards.

Results indicate that most lessons appear to be usable without major barriers for implementation and that content was viewed as fitting state standards. Concerns were expressed about the narrow range of content given the amount of time needed to complete lessons. Assessments were perceived as too long and lacking sufficient validity.

Lessons using the SID monitor were taught at three sites. Learning outcomes from these lessons (e.g. collection of real data, knowledge of content) were perceived as valuable and fitting with existing curriculum and standards. The logistical component of installing the SID monitor was perceived as somewhat burdensome and the amount of effort needed to install the system may not justify outcomes.

### **3.7. Family Science Night**

Dr. Noel-Storr, an external evaluator at the Rochester Institute of Technology, conducts the evaluation for the program. A mixed method approach is used to evaluate the *FSN* program. Tools evaluate whether the program raises the awareness in middle school children and their families of the importance of STEM in their daily lives, if the program enables all members of a family to engage in active learning both within and beyond the program, and if the program promotes connections between parents and children.

Initial data showed that the *FSN* program does indeed motivate families to learn science together. Session observations reveal that 100% of the families engaged in learning science together for at least some part of every session. Participants were observed to be actively engaged (fully participating in activities with their families) in learning for approximately 75% of the total time. Almost all participants (90-100%), adults and children alike, were consistently able to state something new that they learned during each workshop as a result of the activities undertaken, and are able to relate what they learned to their everyday lives. *FSN* also promotes learning beyond the workshops. On average 90% of families report that they conducted STEM related activities as a family between workshops as a result of the Family Science Night program.

The *FSN* program received the 2008 Robert H. Goddard Award for Exceptional Achievement in Outreach.

### **3.8. *The Sunday Experiment***

*The Sunday Experiment* was handed off to the Goddard Visitor Center before formal evaluation could be conducted. However, it is important to note that one of its primary aims was to increase the public's awareness of Goddard in the local community by increasing the number of visitors that come to the Visitor Center. As a result of the program, the Goddard Visitor Center now sees anywhere between 250 and 1000 visitors during *The Sunday Experiment* Program days as opposed to the 25 seen on other typical weekend days.

### **3.9. *AstroZone/Exploration Station***

Although there is no formal external evaluation of the *AstroZone* and *Exploration Station* events, informal surveys of participants have been collected along with demographic information and time spent at the event. These surveys help us to determine whether the stated objectives are being met. They measure levels of engagement, time spent at the event, as well as increased knowledge and interest in the available science topics and the potential for future interest in the STEM topics at the event.

This evaluation has indicated that *Exploration Station* met or exceeded all of its stated objectives. The groups with minors averaged 1.5 hours in the exhibit hall indicating a high level of engagement: over 75% of the respondents indicated that they had learned something new at the event and were able to express what it was. The majority of attendees also indicated there was a topic they were introduced to at the event that interested them to such an extent that they were "likely" to conduct further inquiry into that topic. The event also scored very high on overall enjoyment (4.5/5).

### **3.10. *SDO Social Media Campaign***

We are currently working on a more integrated and effective social media evaluation strategy. Without a formal evaluation pedagogy, concrete insights into efficacy and impact are difficult at this time. However, statistics and numbers are available that can serve as indications of levels of success.

**Twitter:** As of March 2011 the @NASA\_SDO twitter feed has about 7,000 followers with nearly 200 followers being added every month. When the account is put through many of the online Twitter analytics tools that look at the number of followers, interactions with followers, and overall popularity, it receives nearly perfect scores when being graded on use and shows up in the top 15% of Twitter accounts that have also been scored (twittergrader.com). The account has a consistent web influence Klout score in the mid-fifties out of 100, indicating that we "create content that is spread throughout [our] network and drives discussions". The Klout Score is the measurement of your overall online influence. The scores range from 1 to 100 with higher scores representing a wider and stronger sphere of influence. Klout uses over 35 variables on Facebook and Twitter to measure True Reach, Amplification Probability, and Network Score (beta.klout.com).

**Facebook:** SDO has over 14,000 followers between its Little SDO profile and Little SDO fan pages on Facebook. Trends seem to indicate that the pages get upwards of 1,000,000 views a month and around 14,000 comments per month to the information posted. It is also interesting to note that there are almost equal numbers of male and female followers. On average 55% of are male and 42% are

female. It is assumed that the remaining missing percentage is due to the option in Facebook not to pick a sex.

**YouTube:** SDO has two YouTube channels with over 15,000 subscribers and 3,500,000 total views between them.

## 4. Discussion

After significant evaluation, many programs have shown to meet or exceed their stated desired outcomes. Those programs that have not been handed off to partner institutions will continue to operate and in most cases, great insight was gained into how to improve each of the programs. Those that received more critical evaluation are described below and have been significantly overhauled accordingly and are awaiting the next round of evaluations. A small sub-set of programs is still scheduled for formal evaluations. However, informal evaluation and data collection of these programs still indicate they are worth continuing and dedicating funds to formally evaluate each of them.

In response to the *Space Weather Program* (high school SID monitors) evaluation where 50% of sites experienced “some difficulty” with installation, an even easier-to-install and less-expensive (US\$50) monitor, SuperSID, was developed along with the improvement of all support materials, and the addition of an official mentorship component. This new monitor is now included in the *Solar Science Learning Kit*. The program, which now includes over 450 stations, continues to grow and has now been handed off to the Society of Amateur Radio Astronomers. There has also been increased interest in these instruments as ways to increase student interest in science in Developing Nations, and the instruments continue to be distributed through the United Nations IWSI.

*SPOT program* evaluation indicated a desire for more content and longer-term connections to the presentations. Because of the geography of Montana and the program’s statewide reach, it is often difficult to return to locations more than once, or provide on-going support to those interested. As a result, it was decided to develop pre- and post-presentation classroom supporting materials. Teachers and communities receive a packet of materials in advance of a presentation and are provided extra resources upon completion of the presentation. There are also discussions of starting a SPOT presentation teacher training workshop series.

The *Solar Science Learning Kit* was developed as curriculum support material for the *SDO ESL Space Science Course*. Formal evaluation provided the following recommendations. Modify the curriculum to make it more modular (e.g., make single lessons “stand alone”) and fit lessons so they can be used in after school programs; standardize lesson format to more clearly emphasize objectives, materials and information such as difficulty levels for each lesson, amount of time needed and prior knowledge needed to complete lesson; and change assessments to shorter format and develop new questions. These changes have been made and the latest version of the Kit is being distributed through the Colorado Science Teachers Space Summit, the MESA program and via videoconferences through the NASA Digital Learning Network.

Evaluation results of the *FSN* program and four years of beta testing and evaluations have allowed the development of a quite comprehensive and effective facilitator guide and program. Although it had not been thought about it at the start of the program, a significant portion of children participants with minor to severe mental disabilities participated in the program. The majority had ADD, ADHD, and Asperger Syndrome. The program inherently allowed the smooth and

complete integration of these children who were able to participate fully in the program. In fact, moderators did not even become aware of these students until a few sessions had passed and parents would comment how this was the first program that allowed their children to be equals and the positive outcomes it had on their attitudes and self-esteem. Because this was not a goal of the program, there was no formal capturing of this finding other than through anecdotal evidence provided by parents. Along with funds for evaluation, a portion of funds have also been reserved for research into how families learn. There is little research currently available on how families learn. What research can be found indicates how important families are to children's learning. As such, the *FSN program* hopes to contribute to this knowledge base. Formal evaluation of the program including dissemination sites will be completed in 2011. Final results should be available in 2012.

Both *AstroZone* and *Exploration Station* suffer from low turnout numbers both in attendees and exhibitors. The programs were developed based on the American Meteorological Society's WeatherFest that sees between 4,000 and 5,000 visitors come through its activity exhibit hall the day before its annual meeting held each year in January. WeatherFest has three advantages: (1) access to televised meteorological staff that spread the word, (2) a local organizing committee, and (3) complete buy-in from the larger parent organizations (AMS and NOAA). These three areas are lacking in our own event. Along with improving the relationships with the AAS and the AGU the main areas of evaluation based improvement noted by both the attendees and the exhibitors were increasing the number of attendees and increasing the number and variety of exhibitors. This does not come as a surprise and feeds into the increased efforts for our advertising campaigns for next year. The WeatherFest model confirms the draw such programs have and our informal survey results indicate those who do participate are quite engaged in what the program offers. However, attendance numbers must dramatically increase over the next two years for this program to be worth continuing. Hence, the majority of the recommendations for improvement are to assist in creating a more effective advertising campaign targeted to our audience and to potential exhibitors for future event.

Like most social media efforts, the impact of the *SDO Social Media* efforts is difficult to measure. This is compounded by the constantly changing use of individual methods and shifting sense of community. Funds have been allocated to evaluating these efforts and the team is looking to partner with others utilizing social media the way we do to find or develop the best tools and solutions. It will probably take a team of computer scientists, psychologists, and evaluation specialists to truly understand the effectiveness and impact of our efforts. As some of our bigger programs ramp down, more efforts will be allocated to this issue.

## **5. Summary**

The SDO E/PO team has designed a comprehensive and well-balanced portfolio of programs that serve target audiences in all four of NASA E/PO areas. All programs have also successfully aligned themselves with NASA and Heliophysics goals and objectives while keeping within our guiding principles.

The success of our programs is due in part to a significant amount of research performed when developing each of them, looking into best practices, what has been done before including what worked and didn't work. Lessons learned are invaluable to any development process. As such, we have shared some of ours in

this paper and do so in more detail throughout many of the resources we produce and any of the best-practices documents we develop.

All programs are built to improve the perceptions and behaviors of target audiences. The *SPOT* and *SIS* programs teach science and non-science students to be better science communicators, changing not only their own perceptions and behaviors but also those they reach. *A Day at Goddard*, *SDO Ambassador*, *The Sunday Experiment*, *AstroZone* and *Exploration Station* are positively shifting participant interest in science through hands-on activities and one-on-one interactions with scientists and engineers while *FSN* and the *SDO ESL Space Science Course* are significantly changing the perceptions and behaviors of participants through extensive sustained interaction.

Programs such as *The Sunday Experiment*, *FSN*, and *A Day at Goddard* were built to serve as models and backbone programs that others could plug into. *The Sunday Experiment* is a nine-month program that dedicates each monthly meeting to a different mission or engineering challenge. The program as a whole may cost up to \$50K a year in salaries, facilities, and materials. However, with this type of program, an individual mission can choose to sponsor just a single event for 1K. By having multiple missions participate, it also means that should one mission go away, the program is able to continue by finding new missions to participate. This is also the case for each of the other programs that allow for any content to be easily plugged into the format. Lunar and Planetary sessions have already been developed for *FSN* and 3 more Astrophysics sessions are in the pipeline. Sustainability is also a big part of strategy and multiple programs of ours are now self-sustaining beyond the SDO mission. The *(CLC) Module Update*, *The Sunday Experiment*, *Science in Service*, and the *Space Weather Monitor* programs have all been handed off to partner institutions and continue to be successfully run without financial support from the SDO mission.

Thinking outside the box and being able to imagine innovative and creative programs is extremely important to the SDO E/PO team. Through the *SDO Social Media* campaign, the SDO E/PO team has played a key role in how NASA's use of social media has evolved even hosting the first non-manned space flight launch Tweet-up. Prior to SDO efforts, a few missions such as Suzaku and the Mars rovers began blogging in the first person personifying the satellites and robots. Missions such as Hubble and LRO were also taking advantage of Facebook and Twitter. However, there was no dialogue created, simply missions posting information for the public to read. As we were strategizing, there seemed to be clear signals from the public that their true desire was to be actively engaged in discussions. Through the SDO Facebook and Twitter accounts, the E/PO team is actively engaging the public and has built a strong and dedicated following that lets us know within seconds when one of our many online tools is no longer working, serving as our own core of science communicators, and even participating in our events at volunteers.

Now that SDO has launched and terabytes of data are being beamed back to Earth daily, the SDO E/PO team will adjust its focus to include student and public engagement with SDO data. We will look at different ways to get data into the hands of students via inquiry-based projects and into the public sphere through social media, the press, and "citizen-science" data analysis projects.

## **Acknowledgements**

The SDO E/PO team would like to acknowledge and thank all those who have helped and supported our many efforts. Your contributions of writing and editing text, participating in Q&A sessions, volunteering at events, giving presentations, helping develop instruments and programs, as well as supporting teachers and students at all levels, have been invaluable to our efforts.

Special thanks to Elizabeth Citrin and Rob Lilly of the SDO Project Team for their support of E/PO during the development of the observatory. We would like to acknowledge members of the Science Investigation Teams for their contributions to this program. These include Phillip Scherrer and Kelly Beck (HMI), Alan Title, Ed Deluca, and Bruce Ward (AIA), and Tom Woods (EVE).

We would like to say a special thank you to all of our volunteers, including Christopher Anderson, Caitlin Bacha, Phil Chamberlain, Yaireska ColladoVega, Carmel Conaty, László I. Etesi, Andrew Ingles, Leigh Jaynes, Rivers Lamb, Barbara Lambert, Ryan O. Milligan, John W. Mitchell, Andrew Singh, Barbara Thompson, Jonathan Verville, Peter Williams, C. Alex Young.

Finally, we would like to thank Phillip Chamberlin, Steven Christe, László I. Etesi, Todd Hoeksema, Jack Ireland, and Phil Scherrer for reviewing this paper and providing insight into how to improve it.

This work was supported, in part, by the Solar Dynamics Observatory Project and NASA Grants NNH08CD27C-ROSES and NNH09ZDA001N-EPOESS.
