

Lunar Impact Detections During the 2010 Geminid Meteor Shower

Ronnie J. Suggs/NASA/MSFC/EV44

Lunar video observations are routinely conducted at the NASA Marshall Space Flight Center in Huntsville Alabama for the detection of meteoroid impacts. Over 240 impacts have been detected since the start of the observing program initiated approximately 5 years ago. During this time it has been fairly rare that lunar observing conditions and the weather have been favorable during the peak of the major showers. However, observing conditions were marginally favorable during the peak of the 2010 Geminids. On Dec. 14, 2010 approximately 5.5 hours of video were recorded. Even though the lunar phase was just outside the constraints established for optimum lunar impact monitoring, the resulting video was of sufficient quality that 21 lunar impacts were detected yielding an average impact rate of approximately 4 per hour. This compares to 17 lunar impacts detected over 40 nights of observations (approximately 100 hours of lunar video) yielding an average impact rate of 1 per 6 hours for the whole of 2010, excluding Dec. 14. The results of the 2010 Geminid lunar impact detections will be discussed along with previous results from the 2006 Geminid shower that also coincided within the lunar observing window.

Lunar Impact Detections During the 2010 Geminid Meteor Shower

Observing Constraints

Field of View:

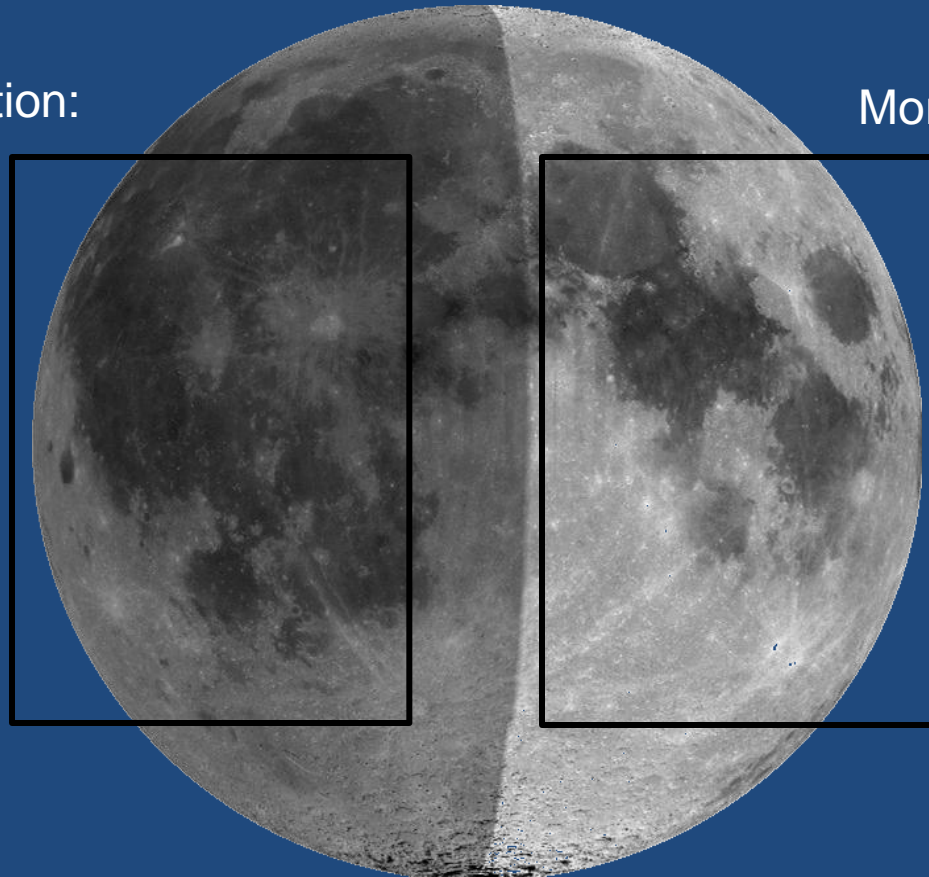

Balance between resolution, coverage area & phase constraints

Lunar Phase Constraint:

0.1 to 0.45 Illumination to reduce glare
Yields 8-9 nights per month

Evening Observation:

Waxing crescent
from twilight end
to moonset

Morning Observation:

Waning crescent
from moonrise
to twilight

Lunar Video Example Frame

9 Jan 2011 01:17:55 UTC

Lunar Video Impact Detection

Peter Gural's Flash Detection
Software version 1.5

Tower & South Dome Videos are
each scanned

The screenshot displays the LunarScan software interface, which is divided into several panels:

- Single Frame or Image Mean:** Shows a grayscale image of the Moon with a white crosshair and a small 'T' in the upper right corner.
- Movie Loop and Patch Sequence:** Displays a sequence of small, dark, noisy frames, likely representing the video being scanned.
- Potential Shower Impact Region for Processing Date:** Shows a circular diagram with a grid of dots, representing the impact region for processing.
- LunarScan Console Window:** A text-based window displaying the main menu and options for the software. The options listed are:
 - 1 = MASK region definition
 - 2 = DARK field update from avi
 - 3 = SCAN avi file or built-in-test
 - 4 = CONFIRMATION of impacts
 - 5 = VIEW and EXTRACT confirmed impacts
 - F = FUTURE prediction impact geometries
 - P = PLAY digitized video file
 - Q = QUIT ProgramThe console also shows a list of confirmed data points:

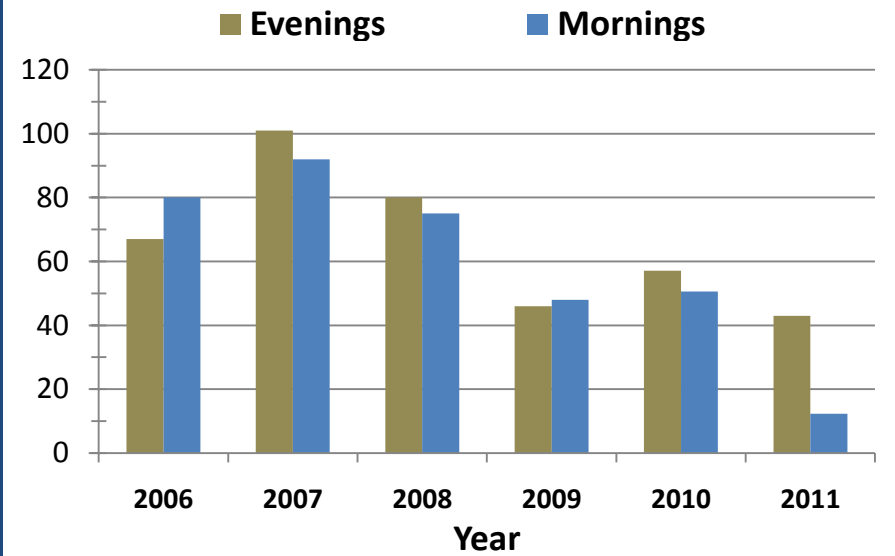

Time	Time	Time	Time	Time	Time	Time	Time

Summary

Lunar Observations were taken during the 2010 & 2006 Geminid showers.

Similar Lunar impact rates were observed for both 2010 & 2006 Geminid showers.

Flash durations for the 2010 impacts were on average longer than the 2006 flash durations.

Yearly Observing Statistics

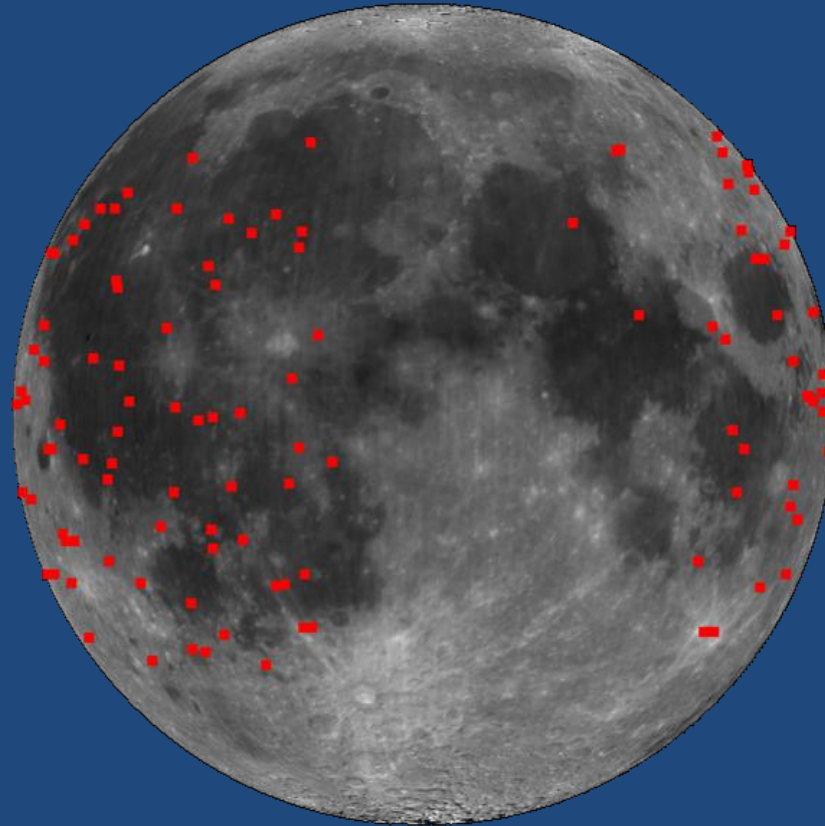

Approximately 3 Years of Analyzed Video Observations

- 548 hours of analyzed lunar video
- 212 hours of photometric quality
- 115 impacts retained out of 175

Evening Lunar Videos

- 277 hours total
- 118 hours retained
- 74 impacts retained out of 110

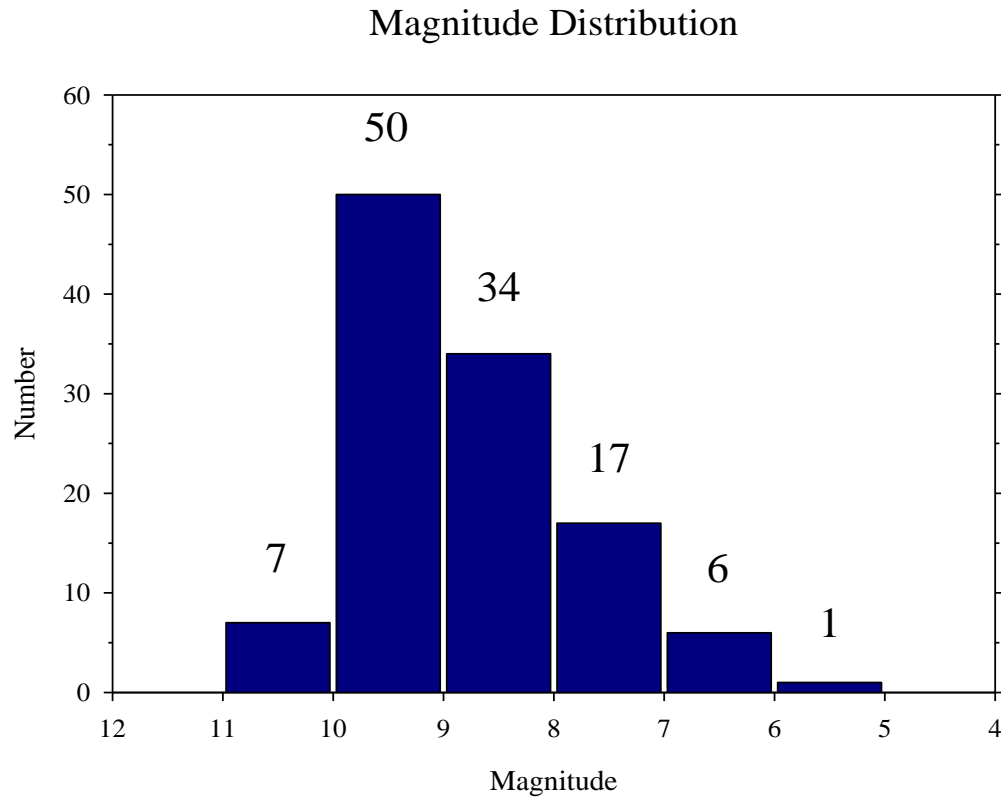

Morning Lunar Videos

- 271 hours total
- 94 hours retained
- 41 impacts retained out of 65

Summary of Analysis Results

- Total observing hours (photometric quality) = 212.4 hrs
- Total impacts in this period = 115
 - 108 to a magnitude completeness limit ~ 10th mag.
- Approximate detectable mass limit = 100g
- Average observing area = $3.8 \times 10^6 \text{ km}^2$
- Calculated Flux = $1.34 \times 10^{-7} \text{ km}^{-2} \text{ hr}^{-1}$
 - Evening $1.55 \times 10^{-7} \text{ km}^{-2} \text{ hr}^{-1}$
 - Morning $1.07 \times 10^{-7} \text{ km}^{-2} \text{ hr}^{-1}$
- Observed flux asymmetry = 1.45 : 1
- Modeled flux asymmetry from major and minor shower contributions during observation period = 1.57

Histogram of Flash Magnitudes

Shows completeness to approximately magnitude 10
