

An Update on Experimental Climate Prediction and Analysis Products being Developed at NASA's Global Modeling and Assimilation Office

Siegfried Schubert
Global Modeling and Assimilation Office
NASA/Goddard Space Flight Center

To be presented at the
APEC Climate Symposium

“Harnessing and Using Climate Information for Decision Making”

17-20 October 2011
Honolulu, Hawaii

The Global Modeling and Assimilation Office at NASA's Goddard Space Flight Center is developing a number of experimental prediction and analysis products suitable for research and applications. The prediction products include a large suite of subseasonal and seasonal hindcasts and forecasts (as a contribution to the US National MME), a suite of decadal (10-year) hindcasts (as a contribution to the IPCC decadal prediction project), and a series of large ensemble and high resolution simulations of selected extreme events, including the 2010 Russian and 2011 US heat waves. The analysis products include an experimental atlas of climate (in particular drought) and weather extremes. This talk will provide an update on those activities, and discuss recent efforts by WCRP to leverage off these and similar efforts at other institutions throughout the world to develop an experimental global drought early warning system.
