Applications for Near-Real Time Satellite Cloud and Radiation Products

Introduction

With increases in computer capabilities & satellite imager data availability, near-real time (NRT) products generated from satellite data are becoming more common & finding more applications. At NASA LaRC, we have been providing satellite-based cloud and radiation parameters in NRT for over a decade. As these analytical datasets become more widely known, researchers have been using them to improve their nowcasts and forecasts of weather and other atmospheric phenomena. The products, their availability and some of their current applications are summarized in this poster.

Availability

On the web: <http://cloudsgate2.larc.nasa.gov>

Products

All products are available at pixel level; some are also averaged to particular grids. Averaging is flexible.

Standard, Single-Layer VISST/SIST

- 0.65, 1.6 μm Reflectances
- 3.7, 6.7, 10.8 μm Temp
- 12 or 13.3 μm Temp
- Broadband Albedo
- Broadband OLR
- Clear-sky Skin Temperature
- Iceing Potential**
- Pixel Lat, Lon
- Pixel SZA, VZA, RAZ

Cloud

- Mask, Phase
- Optical Depth, IR emissivity
- Cloud effective particle size
- Liquid/Ice Water Path
- Effective Temp, height, pressure
- Top/ Bottom Pressure
- Top/ Bottom Height
- Overshooting tops (new)

Multi-Layer: CO₂ chan only (GOES-12 & later)

- Upper & Lower Cloud
- Multi-layer ID (single or 2-layer)
- effective temperature
- optical depth, thickness
- effective particle size
- ice or liquid water path
- height, top/base height
- pressure

Right: Combined GOES-SEV products for N. American domain. a) RGB, b) multi-layer, c) Lower cloud height (km), d) Upper level height (km) M: cloud data useful for many applications.

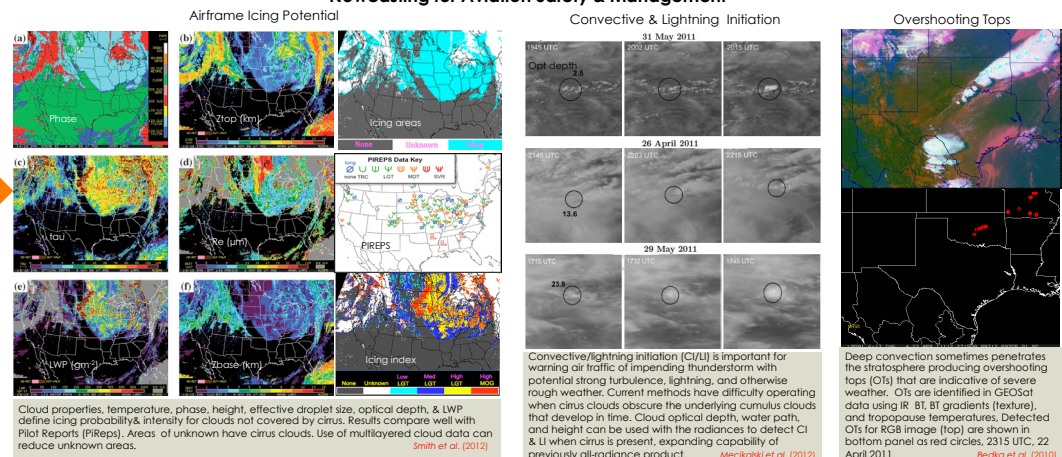

Other applications

- Field program support over 35 experiments supported (see website sidebar)
- Surface radiation budget, solar energy *Pinker et al. (2008)*
- Iceing forecast model assimilation
- Cloudy-sky aerosols *Saife et al. (2012)*
- Potential clear-sky applications: e.g., surface albedo, aerosols, etc.

Nowcasting for Aviation Safety & Management

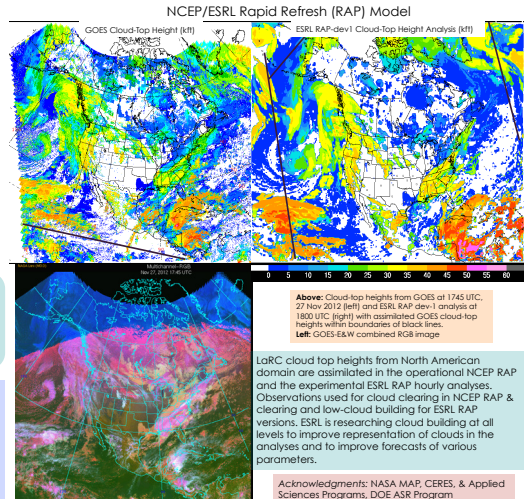

Cloud properties, temperature, phase, height, effective droplet size, optical depth, & LWP define icing probability & intensity for clouds not covered by cirrus. Results compare well with Pilot Reports (PIREPs). Areas of unknown where cirrus clouds. Use of multilayered cloud data can reduce unknown areas. *Smith et al. (2012)*

Convective/lightning initiation (CI/LI) is important for warning air traffic of impending thunderstorm with potential strong turbulence, lightning, and otherwise rough weather. Current methods have difficulty operating when cirrus clouds obscure the underlying cumulus clouds that develop in time. Cloud optical depth, water path, and height can be used with the radiances to detect CI & LI when cirrus is present, expanding capability of previously all-radiance product. *Mechakazi et al. (2012)*

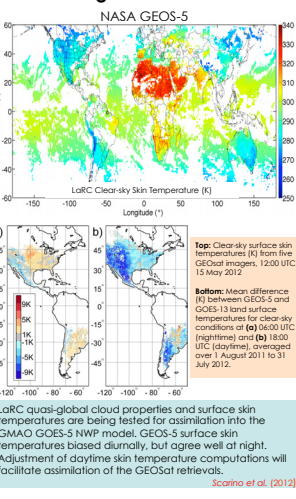

Deep convection sometimes penetrates the stratosphere producing overshooting tops (OTs) that are indicative of severe weather. OTs are identified in GEOSat data using IR, BT, BT gradients (texture), and tropopause temperatures. Detected OTs for RGB image (top) are shown in bottom panel as red circles. 2315 UTC, 22 April 2011. *Bedka et al. (2010)*

Assimilation & Forecasting

NCEP/ESRL Rapid Refresh (RAP) Model
 GOES Cloud-Top Height (kft)
 ESRL RAP-devi Cloud-Top Height Analysis (kft)

Above: Cloud-top heights from GOES at 1745 UTC, 27 Nov 2012 (left) and ESRL RAP devi analysis at 1800 UTC (right) with assimilated GOES cloud-top heights within boundaries of black lines.
 Left: GOES-EW combined RGB image.
 LaRC cloud top heights from North American domain are assimilated in the operational NCEP RAP and the experimental ESRL RAP hourly analyses. Observations used for cloud clearing in NCEP RAP & clearing and low-cloud building for ESRL RAP versions. ESRL is researching cloud building at all levels to improve representation of clouds in the analyses and to improve forecasts of various parameters.

NASA GEOS-5
 Top: Clear-sky surface skin temperatures (K) from the GEOSat Imagers, 12:00 UTC, 15 May 2012.
 Bottom: Mean difference (K) between GEOS-5 and GOES-13 land surface temperatures for clear-sky conditions at (a) 08:00 UTC (nighttime) and (b) 18:00 UTC (daytime), averaged over 1 August 2011 to 31 July 2012.

WRF Deep Convection
 Above: CWP from GOES (top), conventional WRF model (middle), and WRF assimilating GOES CWP (bottom) at 1745 UTC (left) and 2045 UTC (right), 10 May 2010. Black contours correspond to GOES CWP = 0.5 kg m⁻².
 Assimilation of LaRC cloud top heights and cloud water path (CWP) data are being tested at NSSL for the ARM SGP domain. Assimilation improves forecasts of surface radiation and temperature. *Thomas et al. (2012)*
