

# NASA Glenn Research Center experience with “LENR Phenomenon”

Susan Y. Wrbanek, Gustave C. Fralick,  
John D. Wrbanek, Janis M. Niedra (ASRC)

NASA Glenn Research Center

# Outline

- LENR Brief History
- Advantages of Fusion
- Selected Hypothesis
- NASA Glenn Research Center small related experiments

# LENR – Brief History

- 1989 Electrochemists Stanley Pons and Martin Fleischmann observed higher than expected heating in electrolysis experiments involving Deuterium and Palladium.
  - Observed that the temperature rise was higher than could be accounted for by known chemical processes.
  - Speculated that nuclear reactions might explain excess energy.
  - Dubbed “cold fusion” in the press, often known as “Low Energy Nuclear Reactions (LENR),” sometimes “Chemically Assisted/(activated) Nuclear Reactions (CANR)
- Actual cause of reactions still debated at this time.
- A variety of experiments and theories since 1989

# Fusion Processes

## Known Fusion Processes:

- $D + D \rightarrow T (1.01 \text{ MeV}) + p (3.02 \text{ MeV})$
- $D + D \rightarrow {}^3\text{He} (0.82 \text{ MeV}) + n (2.45 \text{ MeV})$
- $D + D \rightarrow {}^4\text{He} (73.7 \text{ keV}) + \gamma (23.8 \text{ MeV})$
- $D + T \rightarrow {}^4\text{He} (3.5 \text{ MeV}) + n (14.1 \text{ MeV})$
- $D + {}^3\text{He} \rightarrow {}^4\text{He} (3.6 \text{ MeV}) + p (14.7 \text{ MeV})$ 
  - $D = {}^2\text{H}, T = {}^3\text{H}$
  - Some have suggested that yet unknown “fusion processes” may be involved.
  - Many “LENR phenomenon” occur without energetic particle or wave radiation measured.
  - A few research efforts have claimed radiation from LENR phenomena, but too little to attribute to known processes.

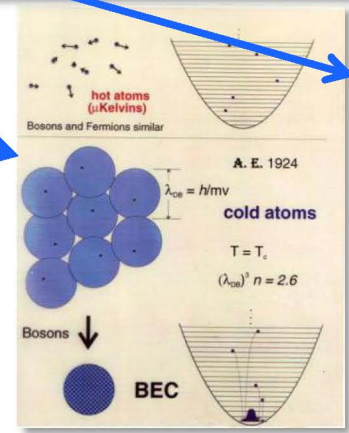

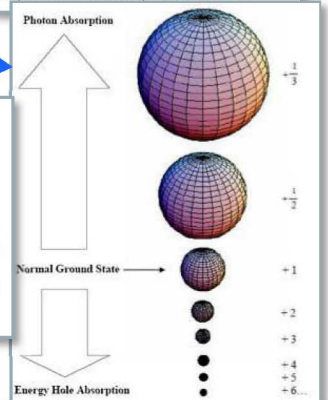

# Some Hypotheses

“Pet Theories” (i.e., Hypotheses where proponents already convinced peer-reviewed journals):

- Electron Screening (Parmenter & Lamb)
- Band States (Chubb & Chubb)
- Shrunk Hydrogen (Maly, Vavra & Mills)
- Ultra Low Momentum Neutrons (Widom & Larsen)
- Dislocation Loops (Hora & Miley)
- Bose-Einstein Condensates (Kim)

Do any of these encompass all reported observations?

- *More than one effect may be occurring*

## Related Experiments at NASA Glenn Research Center (GRC)

- Instances of short-term experiments

## 1989 Gaseous H<sub>2</sub> and D<sub>2</sub>

- 1989 – Following Pons and Fleischmann announcement GRC team of Fralick, Decker, and Blue performed gaseous H<sub>2</sub> and D<sub>2</sub> experiments using a hydrogen purifier containing Pd/Ag alloy.
  - Goal: avoid wet electrochemical cell since they were not electrochemists.
  - Look for neutrons.
  - Use resources readily available.
  - Keep experiment as simple as possible.

# 1989 Gaseous H<sub>2</sub> and D<sub>2</sub>

- Johnson Matthey HP Series palladium membrane hydrogen purifier
- Used in the semiconductor industry and applications where ultra-high purity hydrogen is required (to 99.9999999%)
- An at-hand substitute for a palladium electrolytic cell

Flow Diagram HP Series

# 1989 Gaseous H<sub>2</sub> and D<sub>2</sub>

## EQUIPMENT

- Hydrogen purifiers are made using Palladium membranes

## EXPERIMENT

- After evacuating purifier, it was loaded with deuterium gas at pressures up to 250 psig.
- Purifier temperature and neutron count monitored for several months—non electrochemical variant of Pons-Fleischmann experiment

Hydrogen purifier (center) with neutron detectors on either side

# 1989 Gaseous H<sub>2</sub> and D<sub>2</sub>

## Results:

- Temperature increase noted while gas was loaded into palladium cell, for both D & H
- Neutron detector counts did not differ significantly ( $\leq 2\sigma$ ) from background in any run (Monitored with BF<sub>3</sub> w/ Polyethylene ["Snoopy"] detectors).
- Temperature increase noted when D unloaded at end of experiment
- Compared to hydrogen gas as the experimental control: 15°C increase in purifier temperature consistently seen with D<sub>2</sub> that was not seen with the H<sub>2</sub> control when gasses were unloaded from the purifier.

## Published:

- *Fralick, Decker, & Blue (1989) NASA TM-102430*

Purifier plumbing, showing vacuum pump used to evacuate cell, and gas bottle used to load cell

# 1996 H<sub>2</sub>O-Ni-K<sub>2</sub>CO<sub>3</sub> Electrolytic Cell

## Experiment:

- Investigated reports of significant long-term excess heat in light water-Ni-K<sub>2</sub>CO<sub>3</sub> electrolytic cells
- Two 28-liter electrolytic cells for tests, one active cell for electrolytic tests, second inactive cell for reference thermal measurements
- Tested at several dc currents and a pulse mode current

Two 28 liter electrolytic cells

## Results:

- Apparent current-dependent excess heat exhibited when tested in all modes
- Excess heat consistent as heat from hydrogen-oxygen recombination catalyzed by the Pt and Ni electrodes within the cell
- Did not reproduce the large excess heat reported in literature
  - Gain Factors of <1.7 @ GRC vs. >10 in literature
- NASA TM-107167 (J. Niedra, I. Myers, G. Fralick, R. Baldwin; 1996)

# Multi-Bubble Sonoluminescence

## Experiment:

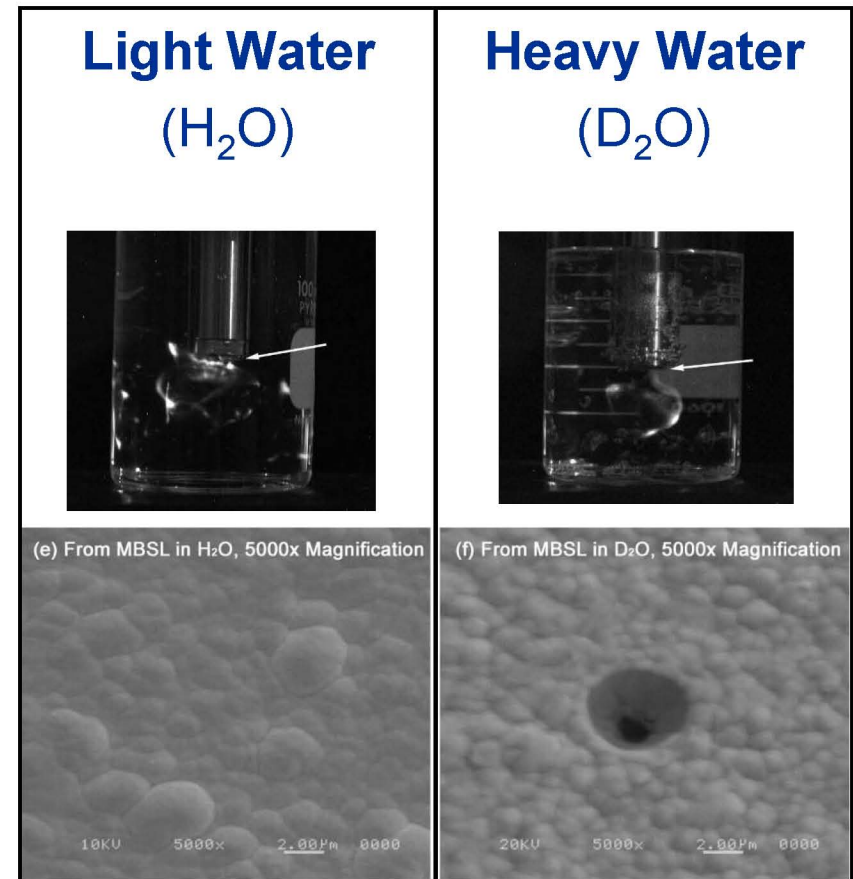

- Investigated energy of ultrasonic-generated multi-bubble sonoluminescence (MBSL)
- Sonoluminescence with Palladium-Chromium (PdCr) Thin Films Over Platinum (Pt) Traces on Alumina

## Results:

- No Crater seen on films in  $H_2O$ , but Crater Formation seen in  $D_2O$
- Large Grain Failures usually seen in thin films due to mismatches in coefficients of thermal expansion at high temperature ( $\sim 1000^\circ C$ )

– Indicates point heating in films?

- J. Wrbanek, G. Fralick, S. Wrbanek, & N. Hall, "Investigating Sonoluminescence as a Means of Energy Harvesting," Chapter 19, *Frontiers of Propulsion Science*, Millis & Davis (eds), AIAA (2009), pp. 605-637.

Surface morphology of films exposed to sonoluminescence in light water (left) and heavy water (right)

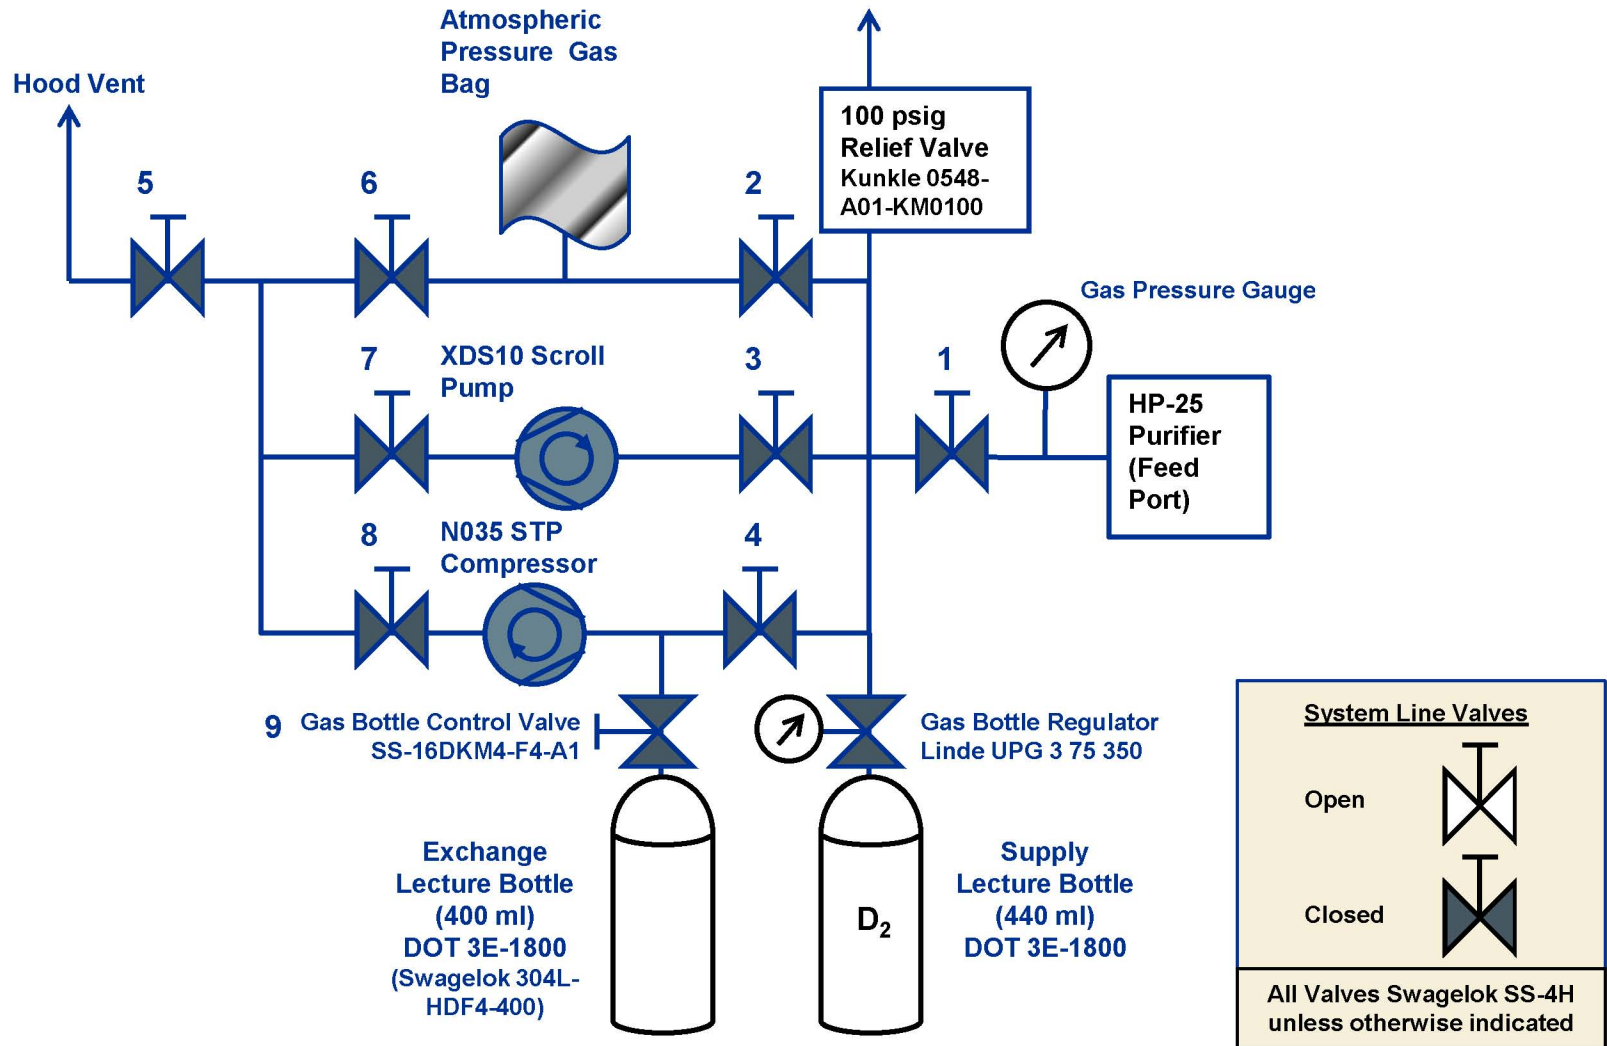

## Summary Observations from 1989 to 2009

- Previous NASA D-Pd experiment (Fralick, et al., 1989) looked for neutrons (saw none) – but saw anomalous heating
- NASA H<sub>2</sub>O-Ni-K<sub>2</sub>CO<sub>3</sub> Electrolytic Cell experiment (Niedra et al., 1996) – Apparent current-dependent excess heat consistent as heat from hydrogen-oxygen recombination
- NASA Sonoluminescence Experiment (Wrbanek, et al., 2007) – Crater formation in PdCr films seen with heavy water, not seen with light water
- After 1989, Cold Fusion research evolved into research in “Low Energy Nuclear Reactions” (LENR), primarily at U.S. Navy, DARPA & various Universities
- **2009 – NASA IPP-sponsored effort to:**
  - Repeat the initial 1989 tests to investigate the anomalous heat
  - Apply GRC’s instrumentation expertise to improve the diagnostics for this experiment
  - Establish credible framework for future work in LENR

# 2009 IPP APPROACH: Flow System Schematic

# APPROACH: 2009 Test Apparatus

- Johnson Matthey HP-25 hydrogen purifier
  - Purifier Filter contains a ~50g heated Pd-25%Ag membrane
- Load Filter by flowing hydrogen gas into the purifier
- Unload Filter by pumping the gas out of the purifier into a sample bottle
- Turn off filter heater for a time when Loading & Unloading
- Monitor changes in temperature, neutron/gamma background
- Repeat with deuterium gas; Compare results

# RESULTS: Temperatures vs. Time

## Loading

## Unloading

Hydrogen

Observed Temperature for H2 Load

Observed Temperature for H2 Unload

Deuterium

Observed Temperature for D2 Load

Observed Temperature for D2 Unload

# RESULTS (continued): Temperature Changes vs. Time

Results of GRC IPP investigation: a) the temperature data is shown for H2 and D2 unloading (left); b) the calculated thermal power in/out is given with the net anomalous heating (right).

- No changes seen in neutron background counts

## Summary & Conclusions

- NASA GRC has conducted a variety of small-scale short-term investigations into LENR-related claims
- Isotope-dependent heating was seen in a hydrogen purifier during gas evacuation in 1989
- Point craters in films exposed to sonoluminescence in water in 2007 also had isotope dependence
- Follow on study of hydrogen purifier heating done in 2008 documented the 1989 anomalous heating effect
  - More data needed to draw conclusion of its nature
- Small-scale work continues:
  - 2011 Center Innovation Fund “Fast-Track” 2-week project to determine dependency of rate of withdraw on the heating effect
  - Short project time limited effort to experiment setup and rough preliminary data run; more data still needed to clarify uncertainties
- If proven useful, the transient nature of this heating effect needs to be better characterized for applications to cyclic power systems
