

Modeling & Testing of the Capsule Parachute Assembly System (CPAS)

February 21, 2013

CPAS OVERVIEW

CPAS Overview

- Capsule Parachute Assembly System (CPAS) is the parachute system for the Orion vehicle used during re-entry
 - Similar to Apollo parachute design

- A Government Furnished Equipment (GFE) project responsible for:
 - Design
 - Development testing
 - Performance modeling
 - Fabrication
 - Qualification
 - Delivery

- Collaboration between NASA JSC, ESCG, and Airborne Systems

CPAS Concept of Operations

Capsule Parachute Assembly System

Nominal Mission and High Altitude Abort Deployment Sequence

CPAS Analysis Focus

- Flow from flight performance requirements from the CPAS Project Technical Requirements Specification (PTRS) Revision
 - Meet during specified failure conditions
- Rate of Descent (ROD)
 - Crew and vehicle structure safety
- Parachute Loads
 - Drogue and Main single riser loads
 - Individual parachute failure
 - Drogue and Main cluster loads
 - Sum of individual riser loads
 - Vehicle structural failure
- Rotation Torque Limit
 - Main risers induce rotation
 - Orient vehicle edge into water for landing

Agenda

- Airdrop Testing
 - Gen I & II
 - EDU
- Parachute Analysis
 - Simulations
 - Preflight Analysis
 - Post-Flight Analysis
- Development of a Parachute Model
 - Reconstructions
 - Statistically Derived Parameters
- System Verification
- Future of CPAS

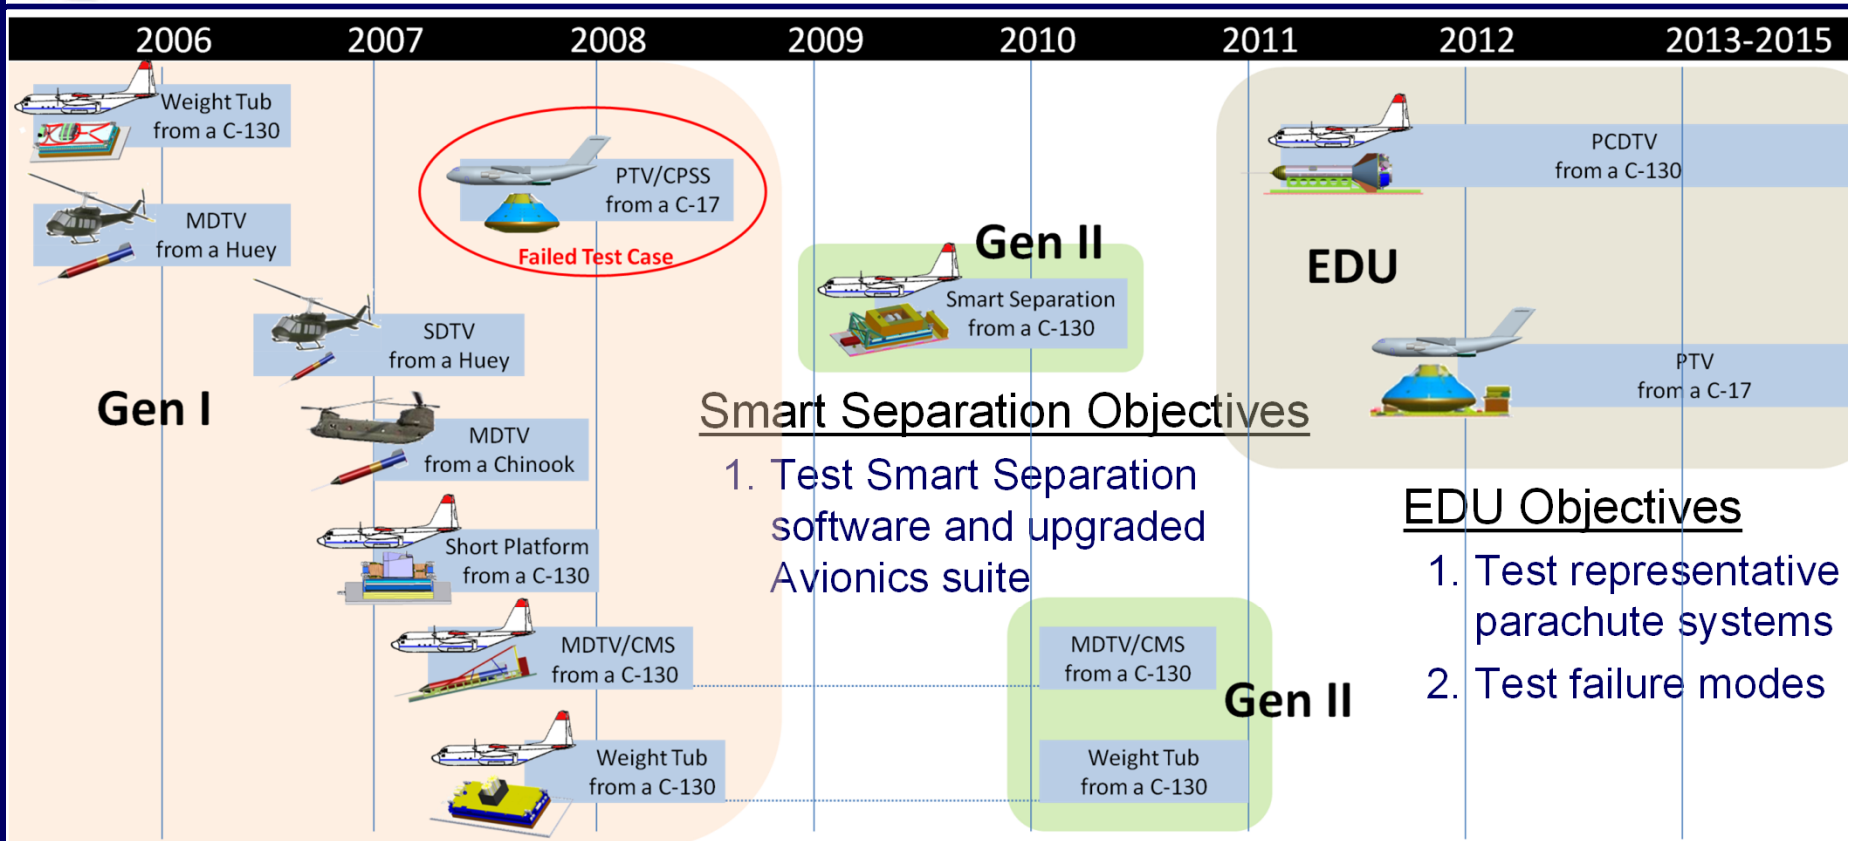

Gen I & II
EDU

AIRDROP TESTING

Evolution of Test Vehicles & Techniques

Capsule Parachute Assembly System

*All vehicles extracted from an aircraft used a Type V LVAD Platform.

Gen I Objectives

1. Characterize single parachute inflation parameters
2. Demonstrate the system

Smart Separation Objectives

1. Test Smart Separation software and upgraded Avionics suite

EDU Objectives

1. Test representative parachute systems
2. Test failure modes

Gen II Objectives

1. Test failure modes
2. Investigate potential design changes

CPAS Parachutes

- Extraction Chutes (~28 ft)
 - Pulls the vehicle out of the aircraft. Used for testing only.
- Programmer Parachutes
 - Used to create the proper test conditions for the Drogue, Pilot, or Main chutes. Used for testing only.
 - Can sometimes be an identical chute as the Drogues, but the use is different.
- Forward Bay Cover Parachutes (FBCPs) (~7 ft)
 - Pulls off Forward Bay Cover (FBC) from vehicle
- Drogue Parachutes (~23 ft)
 - Stabilizes the vehicle for Main deployment.
- Pilot Parachutes (~10 ft)
 - Pulls out the Main chutes.
- Main Parachutes (~116 ft)
 - Slow the vehicle to landing

Extraction Chute

Programmer Chute

Main Chute

Not to Scale

Gen I & II

EDU

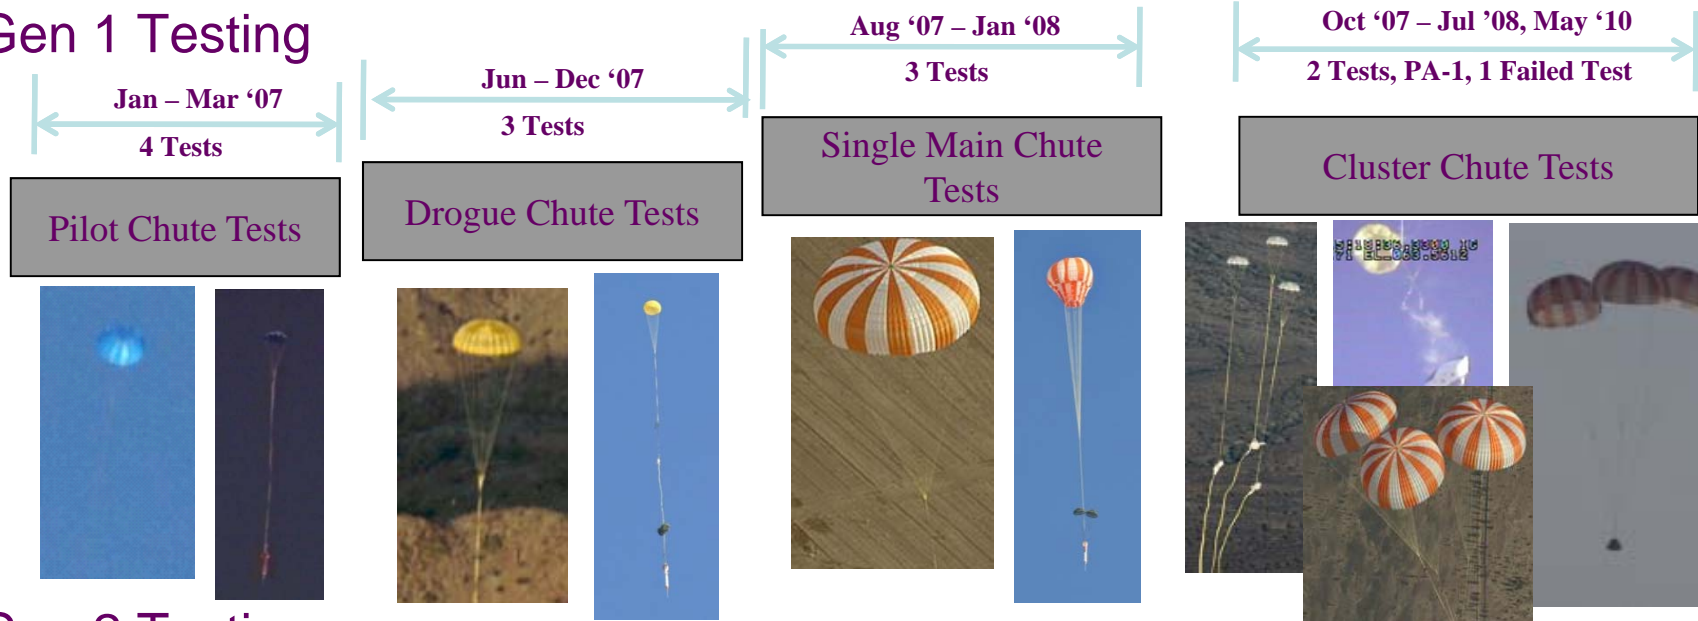

AIRDROP TESTING

CPAS Gen 1 and Gen 2 Test Progression

Capsule Parachute Assembly System

Gen 1 Testing

Gen 2 Testing

Gen I & II Test Vehicles

- Each test vehicle was designed to achieve a specific test objective
- Weight Tub
 - Test the parachute system with a representative weight
 - Significantly tested and proven operations with a quick turn around
- Small or Medium Drop Test Vehicle (SDTV or MDTV)
 - Heritage vehicle from the X-38 program
 - High dynamic pressure
- Parachute Test Vehicle (PTV & PT)
 - Wake similar to the Orion capsule

Gen I MDT-3
Gen II CDT-2

Gen I PTV (CDT-2)

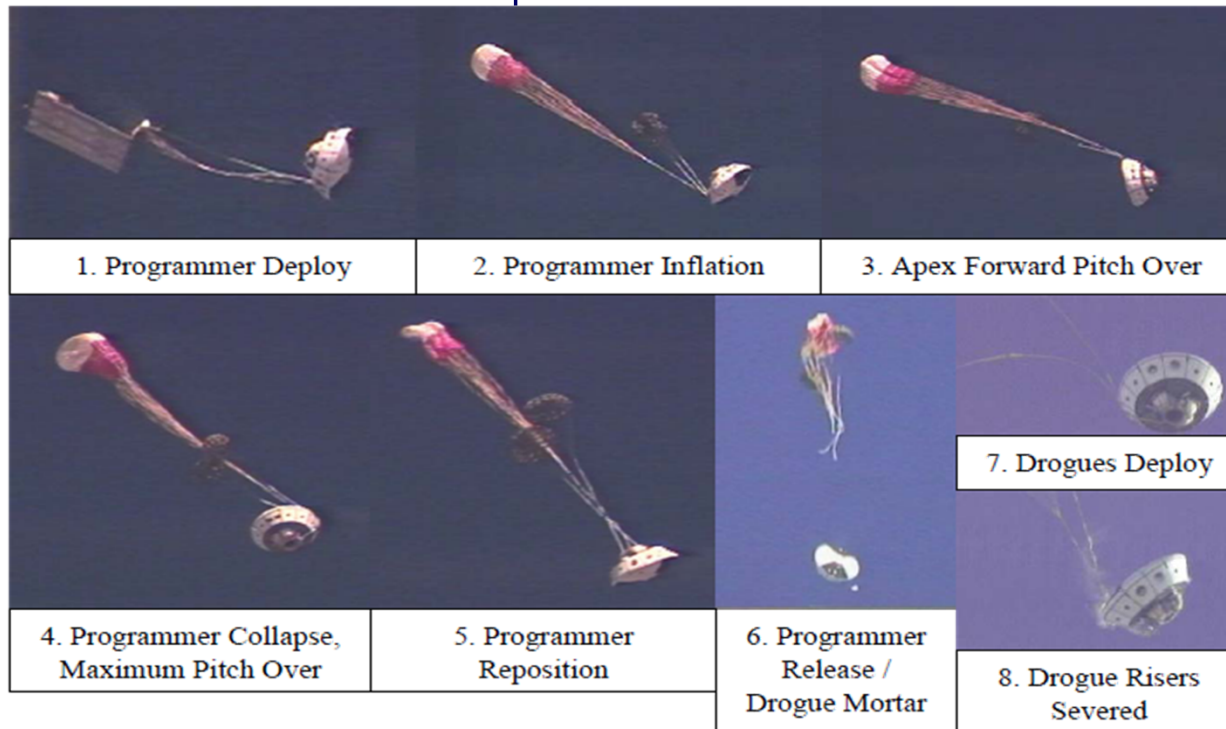

Gen I MDT-3 Build Up

Gen I CPAS PTV Failure (CDT-2)

Capsule Parachute Assembly System

- Cause of failure
 - Inability of programmer to remain inflated due to test vehicle wake
 - Programmer trailing distance was insufficient
 - Stabilization parachutes caused additional, not simulated wake
- Contributing factors
 - Late completion of ConOps
 - Small, unproven reefing used on the programmer (20%)
 - Lack of robust extraction and separation simulations

Boilerplate Failure Recovery

- Increased knowledge regarding wake effects
 - Computational fluid dynamics (CFD) anchored to wind tunnel testing
- Improved understanding of vehicle separation
 - Smart separation algorithm was created
 - Validated on 3 Gen II tests – Test Support Equipment (TSE) series
 - Separation simulations
 - Two-body 6-Degree of Freedom (DOF)
 - Models the separation and close proximity dynamics
- Lessons learned from boilerplate failure
 - Smart separation algorithm used to separate the PTV2 from the CPSS
 - Aerodynamic databases will be based on PTV wind tunnel data
 - Stabilization parachutes will not be used
 - Simulations will account for wake effects
 - All protuberances will be eliminated or rounded

Gen II Avionics Advancements

- Data Acquisition System (DAS) - cRIO
 - Centralized unit for controlling and storing data from multiple instruments
 - Allowed for time-synchronization of data
 - Larger storage capacity
- Upgraded Velocity Measurement Instrumentation
 - NovAtel SPAN-SE
 - Accurate measurement assists in ROD
 - Crossbow Nav440
 - Higher velocity uncertainties than NovAtel
 - Triggers smart separation
 - Both are integrated GPS/IMU
 - Mitigates drop outs during extraction phase

cRIO

NovAtel SPAN-SE

Crossbow Nav440

Gen II Avionics Advancements

- Upgraded Load Measurements
 - Gen I used Tension Measuring System (TMS) units attached to each riser - had high uncertainty
 - Gen II used 30,000 lbf strain links attached between the riser and confluence fitting
 - Provide adequate data for the Main parachutes
 - Provided noisy data on the Drogue parachutes due to the turbulent wake environment
- Increased Fidelity in Atmospheric Data
 - Windpack and balloon released to travel through similar air column as test
 - Ground weather stations on the drop zone
 - Anchors windpack and balloons with ground surface winds

Gen I & II

EDU

AIRDROP TESTING

EDU Test Vehicles

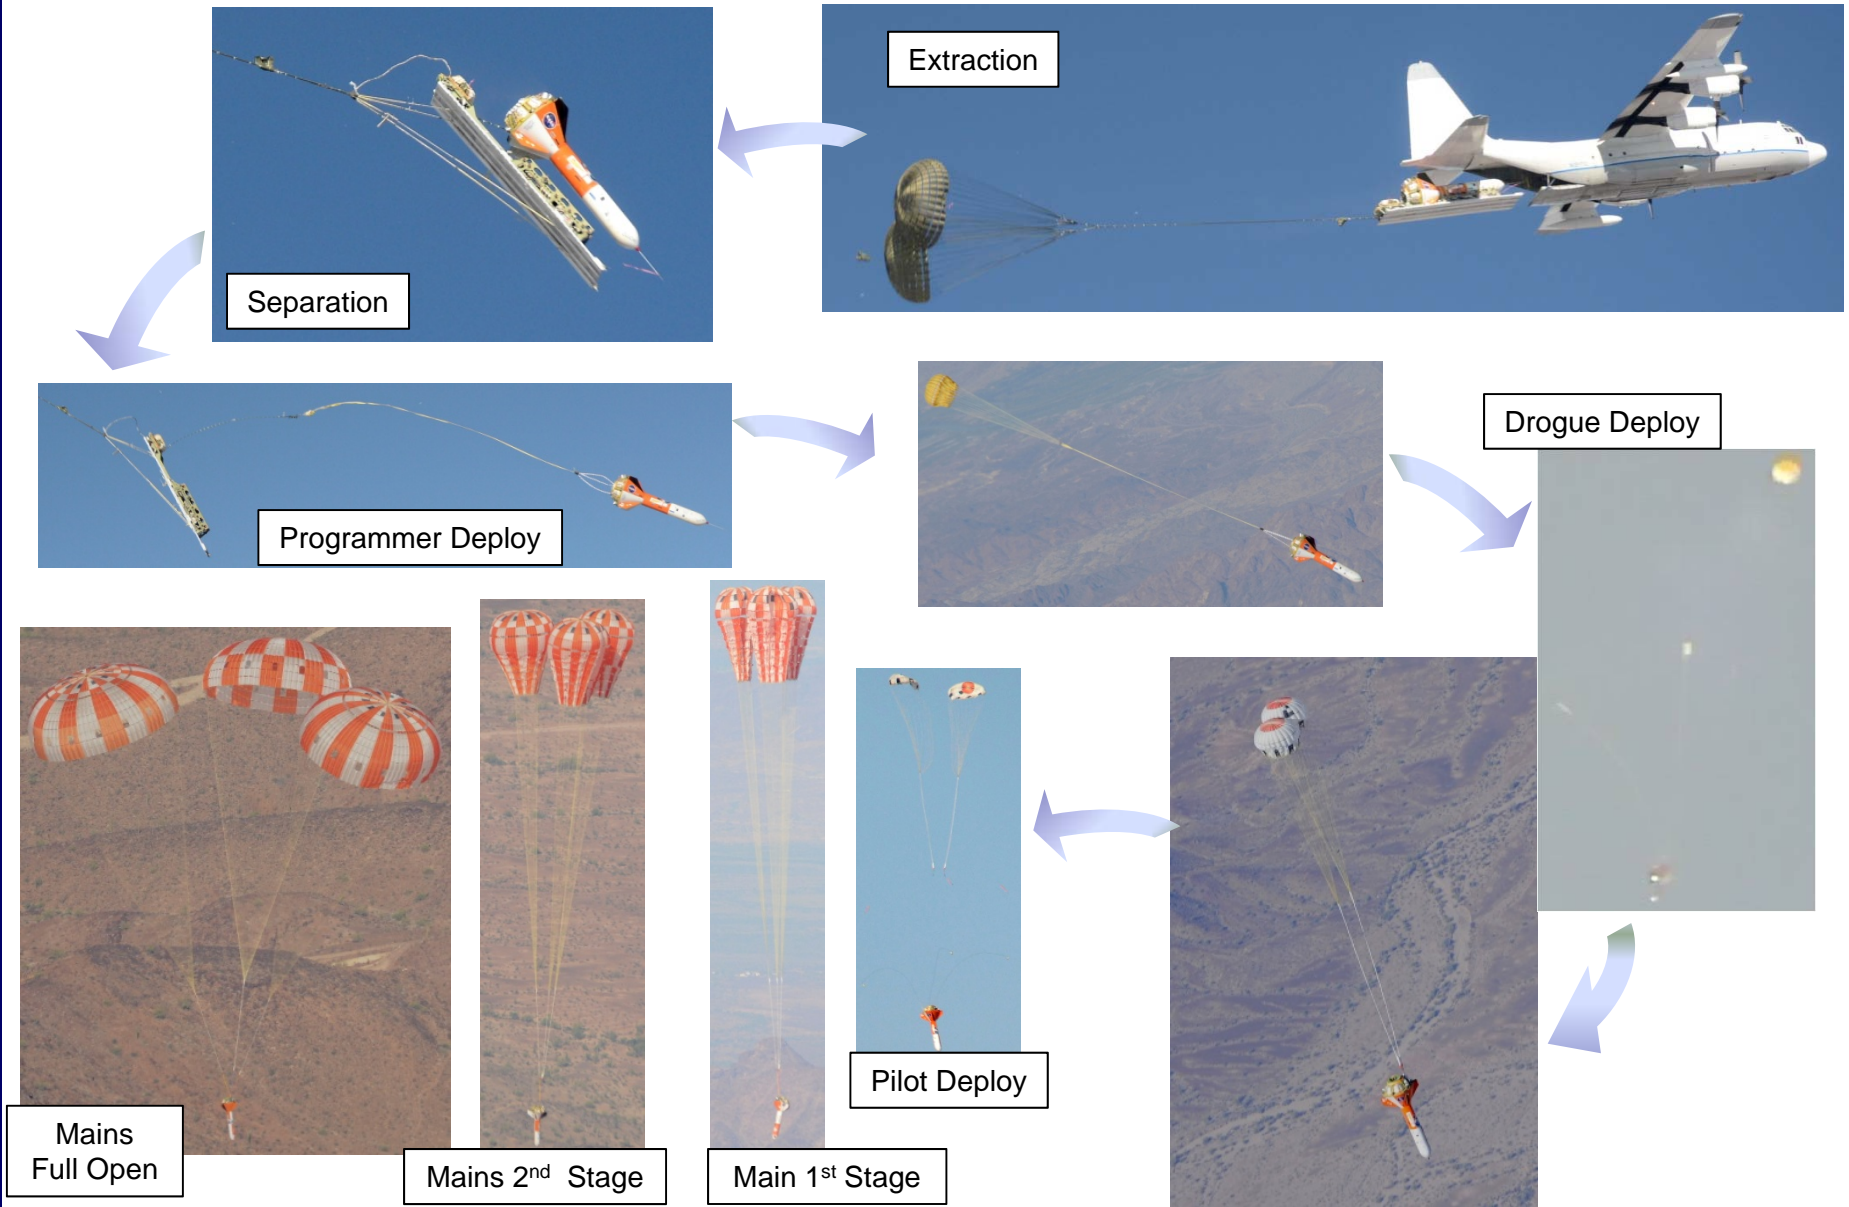

- Mid-Air Delivery System (MDS) & Cradle and Platform Separation System (CPSS)
 - Allows the PCDTV and PTV to be deployed from an aircraft cargo bay
- Parachute Compartment Drop Test Vehicle (PCDTV)
 - Tests the full CPAS system utilizing a stable vehicle
 - Dart shape based on the Solid Rocket Booster and Ares booster parachute test program
 - Allows for achievement of high dynamic pressure
- PTV/CPSS
 - Tests the full CPAS system with representative vehicle aerodynamics
 - Unable to achieve high dynamic pressure with current test techniques

PCDTV Test Sequence

Capsule Parachute Assembly System

PTV Test Sequence

Smart Separation after Ramp Clear

Extraction from C-17 at 25,000 ft with two 28 ft Extraction Parachutes

Two Full-Open Gen II Drogues as Programmers deployed

Programmer cut
One Drogue deployed

Smart Drogue Release using SDR

3 Pilots lift 3 Mains with nominal reefing

PTV Touchdown

Simulations

Preflight Analysis

Post-Flight Analysis

PARACHUTE ANALYSIS

Simulation Tools

- CPAS uses numerous simulation tools for preflight predictions, mission support, and post-flight data analysis and reconstructions
 - Determine configuration design
 - Ensure safety of test and personnel
 - Assess test objectives and solve unexpected test results
 - Parachute model development
- Tools have evolved from low fidelity spread sheets to high fidelity independent parachute simulations
- End-to-end trajectories currently require use of multiple simulations
 - Desired to consolidate number of simulations
- Many of the simulations are developed and maintained by NASA JSC EG
- Support and processing tools developed and maintained by ESCG

Preflight Analysis

Post-Flight Analysis

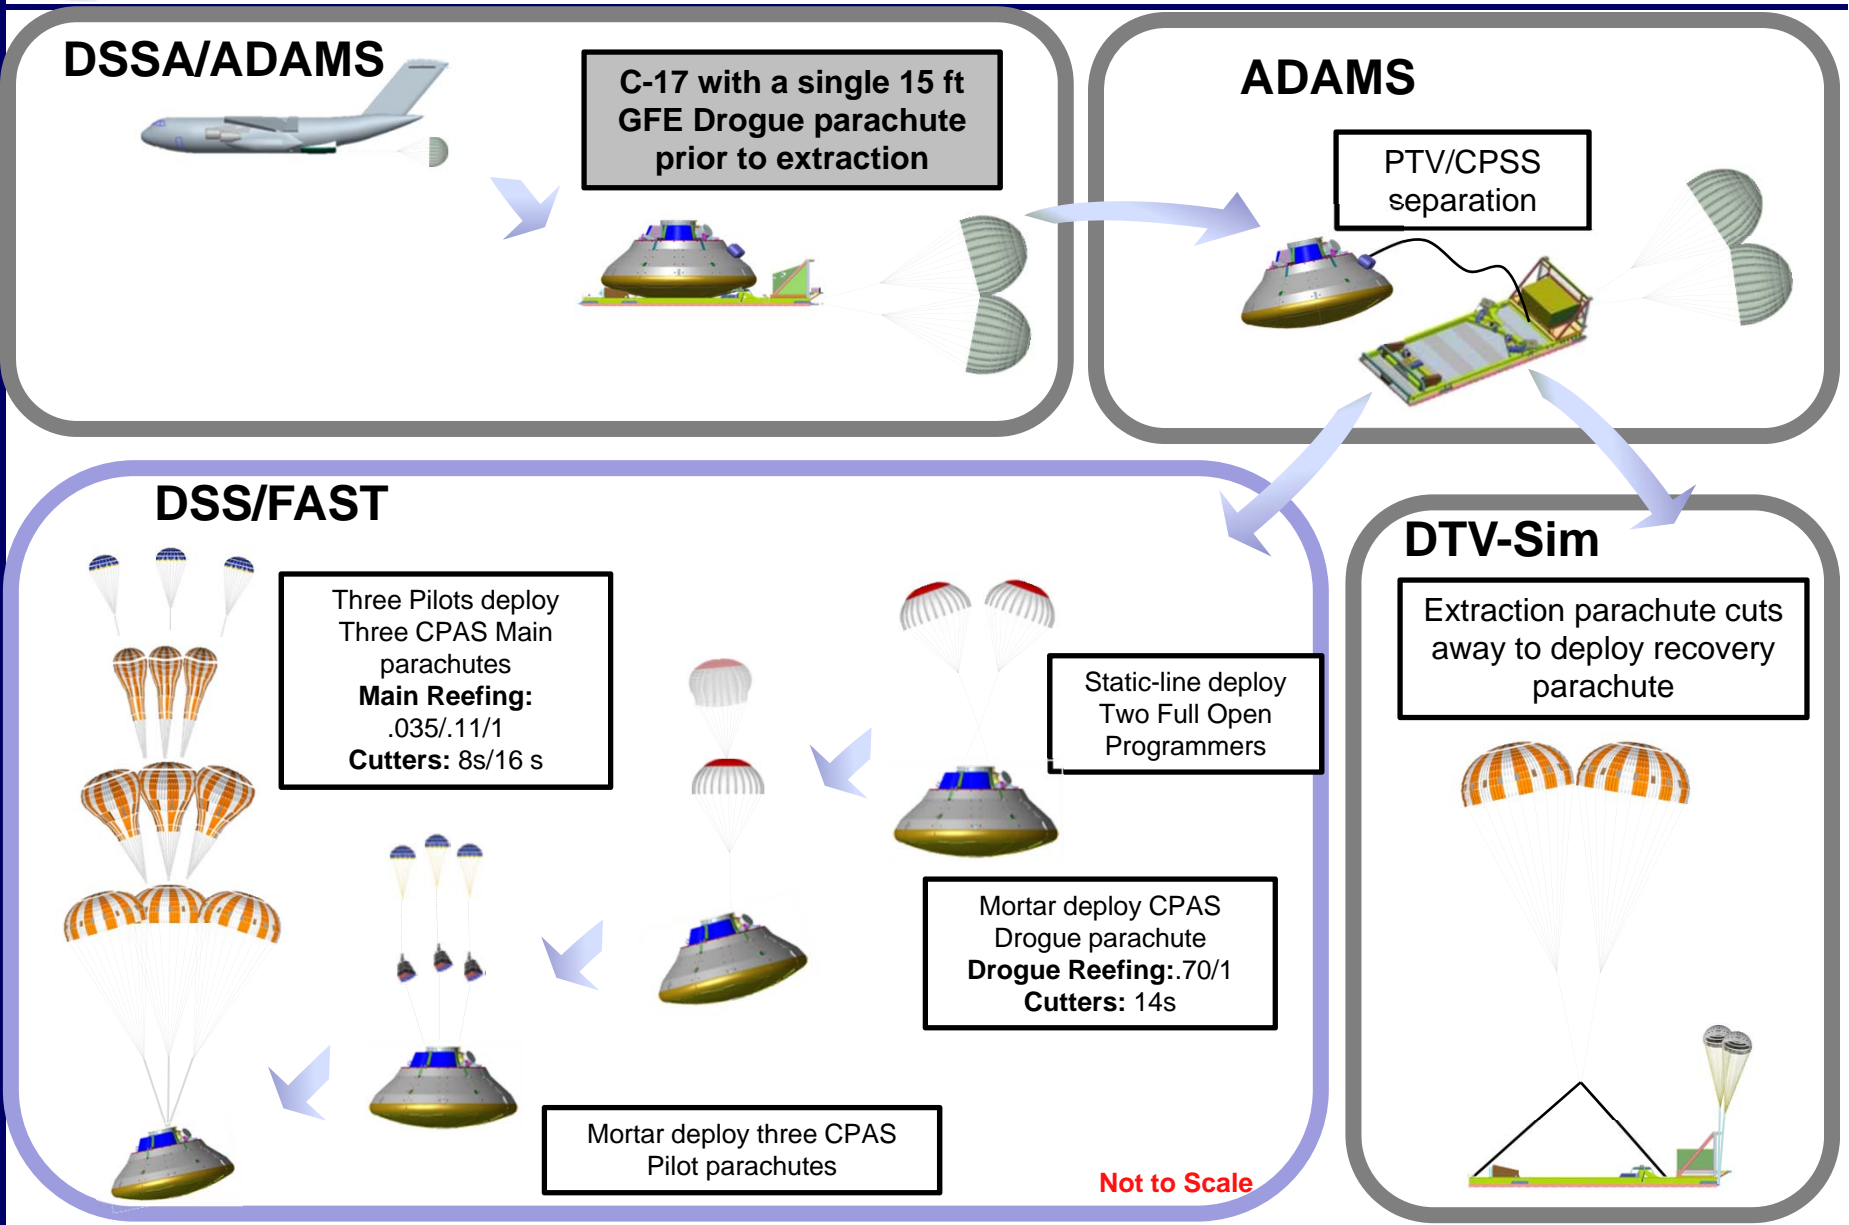

PARACHUTE ANALYSIS

Post-Flight Data Analysis

- Windpack and balloon data
 - BEA: Best Estimate Atmosphere
 - BEW: Best Estimate Winds

- Vehicle Data used to create Best Estimate Trajectory (BET)
 - Dynamic Pressure
 - Loads*
 - Drag Area ($C_D S$)*

- Photogrammetry
 - Fly-out angles during steady state

*completed for each phase of each parachute

Capsule Parachute Assembly System (CPAS) - ESCG Analysis Team
Wind Components Profile (CDT-3-5)

Capsule Parachute Assembly System

➤ Winds < 30 ft/s mostly out of SW

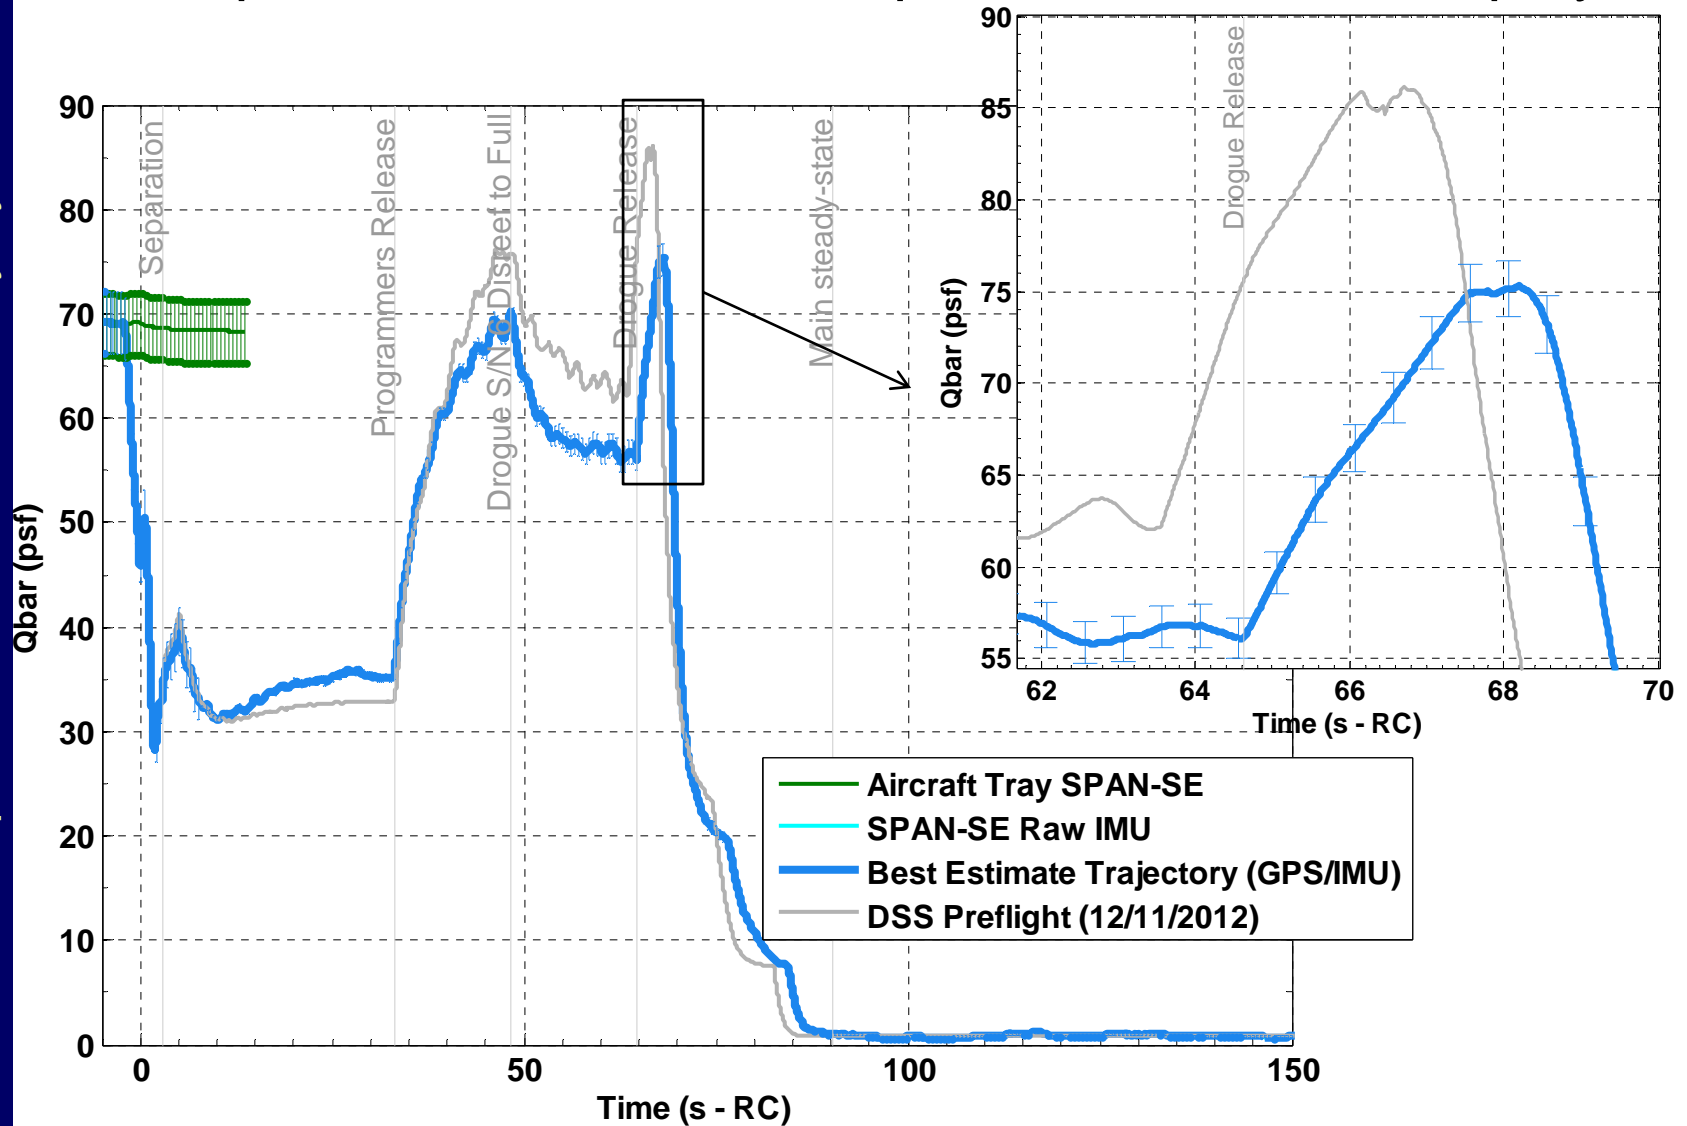

Dynamic Pressure

➤ ~11 psf lower than nominal prediction at Main deployment

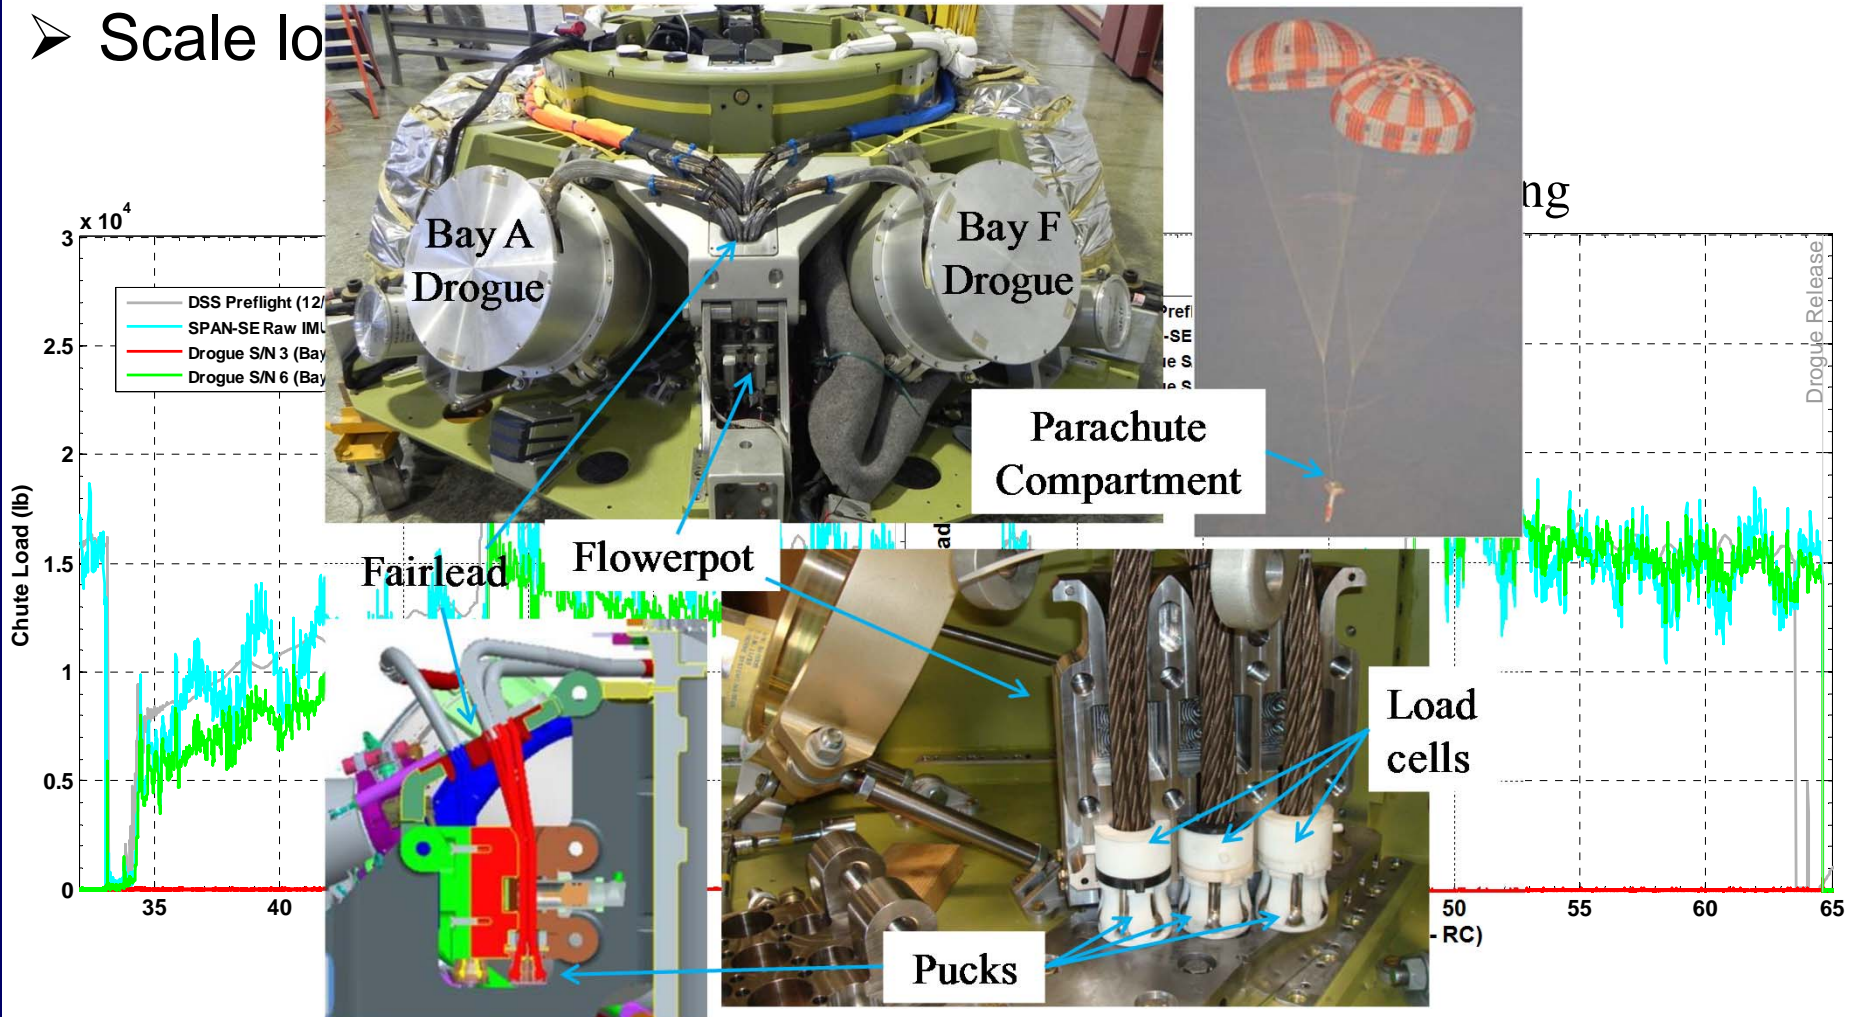

Capsule Parachute Assembly System

Load Scaling

- Scaling due to load cells being below fairlead
 - Energy lost due to friction
- Scale lo

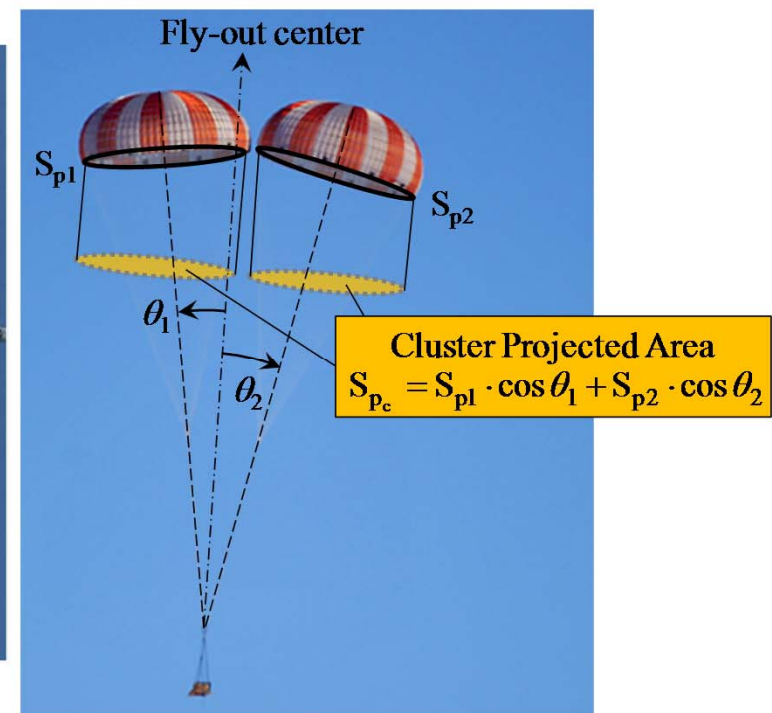

Capsule Parachute Assembly System

Photogrammetrics

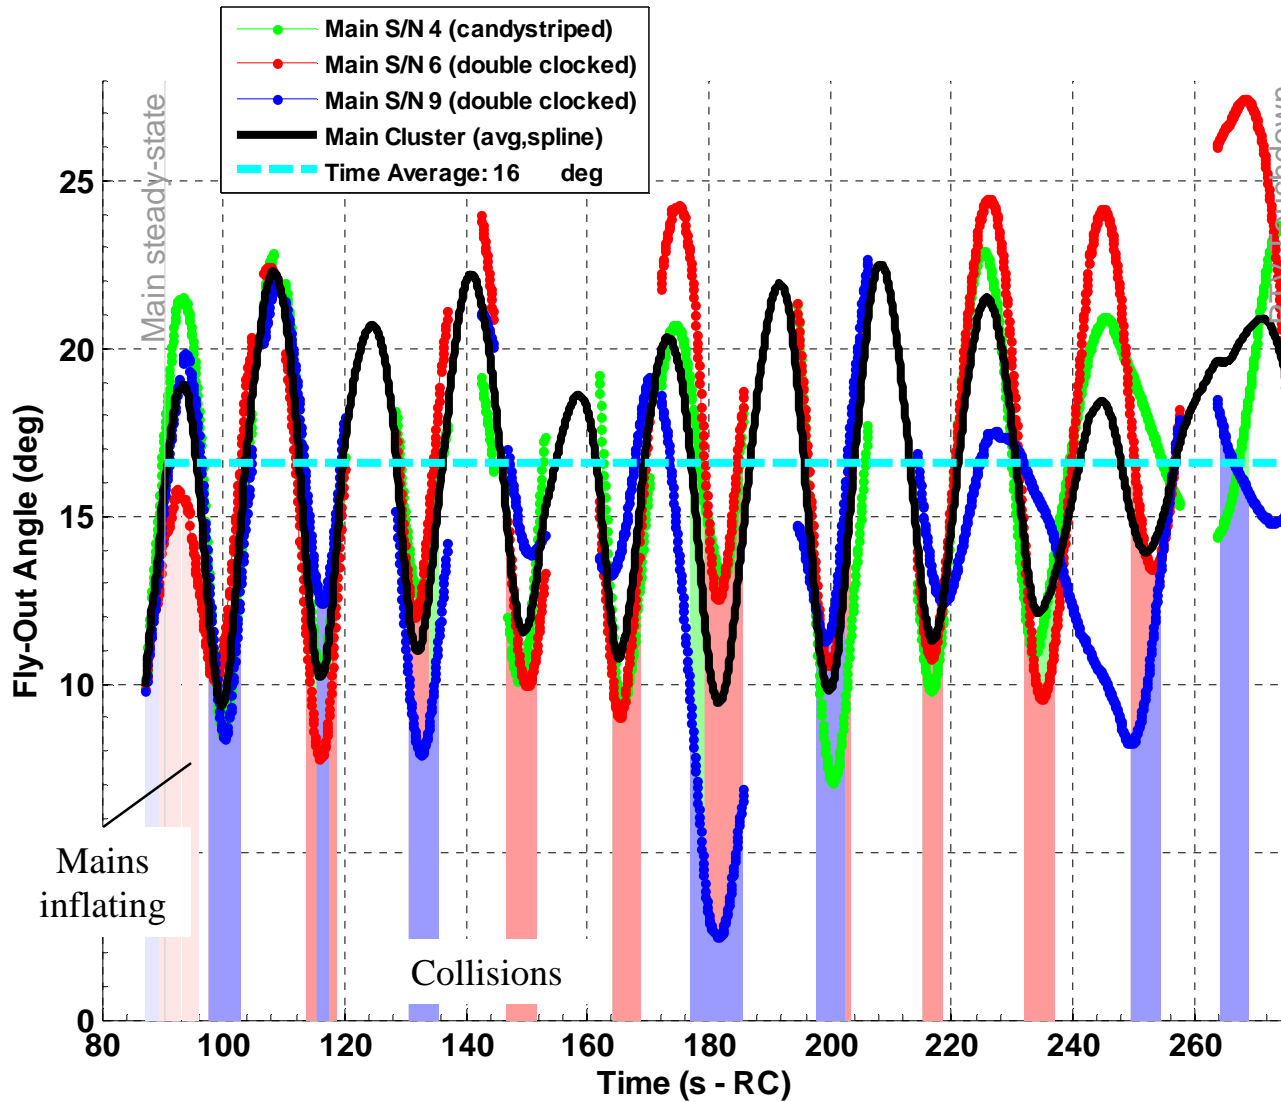

- Used to characterize Main parachute behavior in a cluster
 - Quantify fly-out angles, geometric inlet area, and twist angles
 - Understand collisions and other parachute dynamics
 - Rate of Descent (ROD)
 - Reefing line tension
- Provides insight into dynamics which is related to data gathered

Fly-Out Angles During Steady State

Capsule Parachute Assembly System

Reconstructions

Statistically Derived Parameters

DEVELOPMENT OF A PARACHUTE MODEL

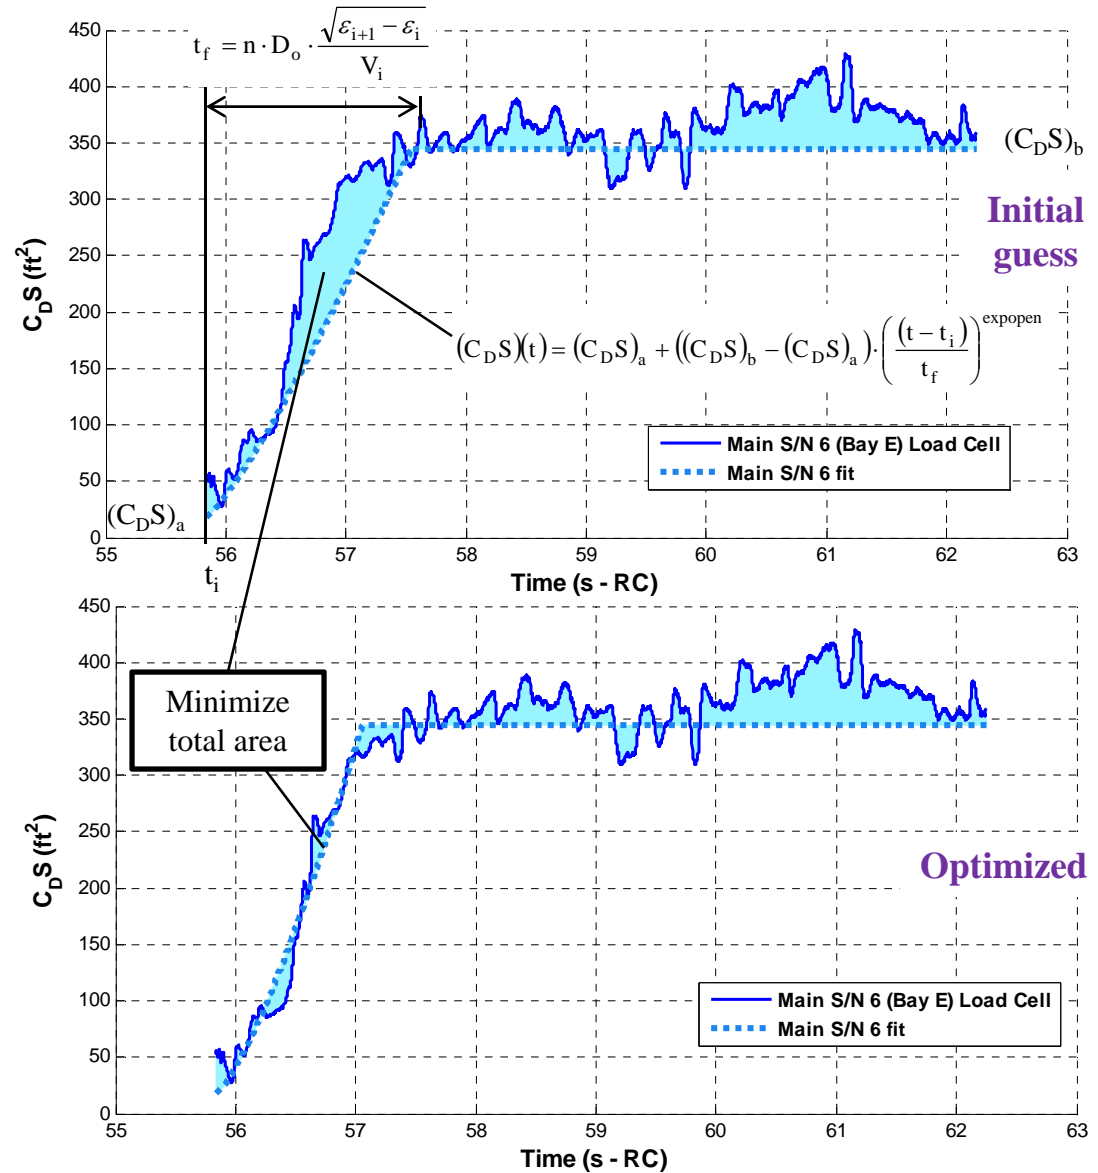

Test Reconstruction

- Use BEA/BEW/BET
- Iterate parachute parameters
 - Automated process
 - Start with latest Model Memo values
- Output parachute parameters that cause simulation to match the BET
- Parameters are published in semiannual Model Memo
 - Assess parameters through benchmarks

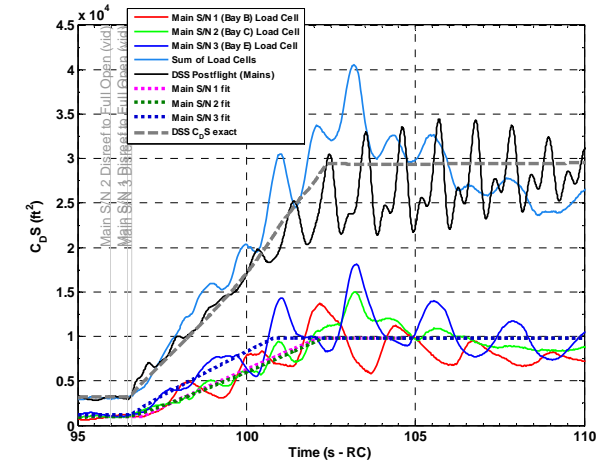

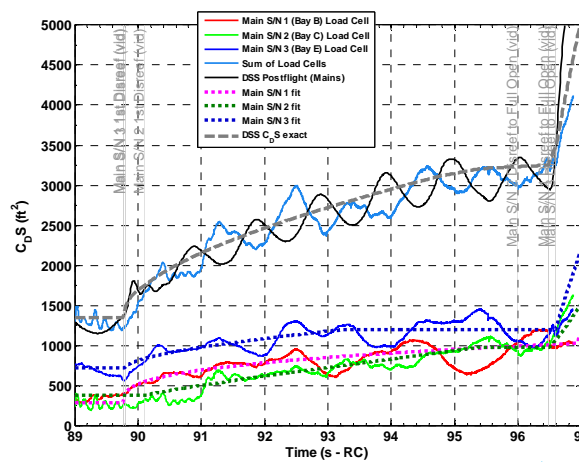

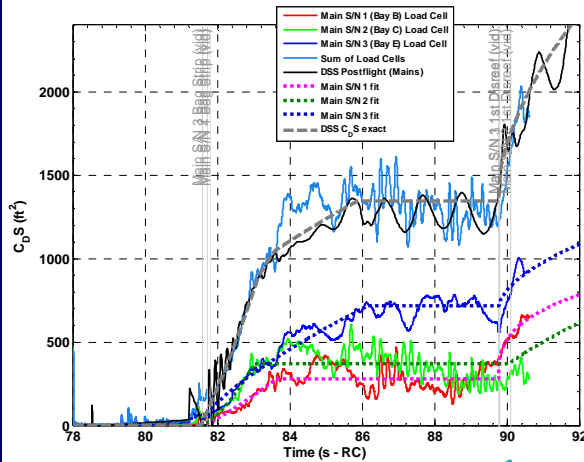

Finite Mass Inflation Curve Fit

1. Determine Parachute Parameters:
 - Start time, t_i
 - Initial Airspeed, V_i
 - Drag coefficient from equilibrium velocity, C_{D_o}
 - Time average drag areas
 - Start Drag Area, $(C_D S)_a$
 - End Drag Area, $(C_D S)_b$
 - Full open drag area, $(C_D S)_o$
 - Or describe area reefing ratios, $\varepsilon_i, \varepsilon_{i+1}$
2. Generate inflation curve with guessed parameters:
 - Fill constant, n
 - Profile shape, expopen ,
 - Optional: guess ε_{i+1}
3. Compute difference between inflation curve and test data
4. Sum the difference to compute area between curves (error)
5. Iterate n and expopen to minimize the error area
 - Optional: optimize ε_{i+1}

Main Best Fit Inflation parameters

	Main SN 1	Main SN 2	Main SN 3
--	--------------	--------------	--------------

Reefing Ratio, ϵ_1	3%	4%	7%
Reefed Drag Area per canopy, $(C_D S)_R$ (ft ²)	280	372	718
Fill Constant, n	27.6	17.0	38.0
expopen	1.2	1.5	0.7

Reefing Ratio, ϵ_2	12%	10%	12%
Reefed Drag Area per canopy, $(C_D S)_R$ (ft ²)	1,142	976	1,197
Fill Constant, n	39.8	22.8	16.8
expopen	0.3	0.9	0.6

Drag Coefficient, C_D	0.93	0.93	0.93
Full Open Drag Area per canopy, $(C_D S)_o$ (ft ²)	9,850	9,850	9,850
Fill Constant, n	3.7	4.2	3.1
expopen	1.0	1.1	0.9

Inflation parameters from individual parachute reconstructions for each stage are recorded in a spreadsheet

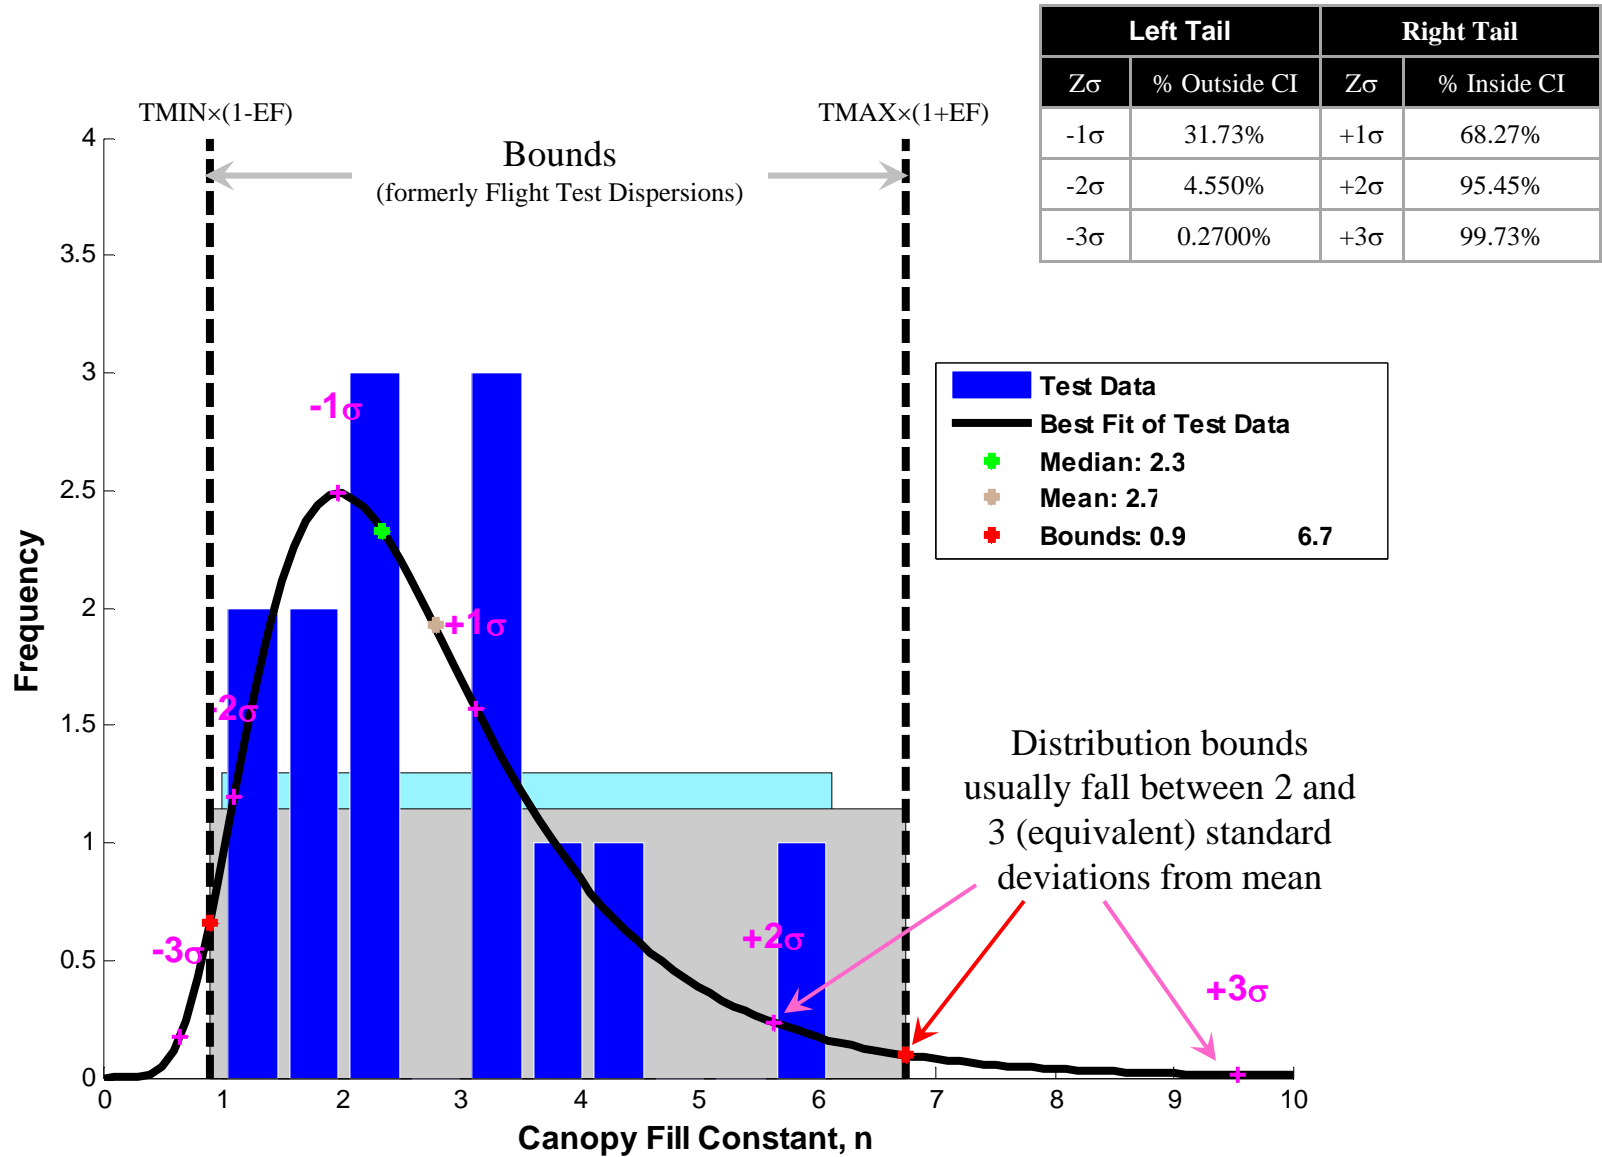

Reconstructions

Statistically Derived Parameters

DEVELOPMENT OF A PARACHUTE MODEL

Transition from Uniform to Statistical Distributions

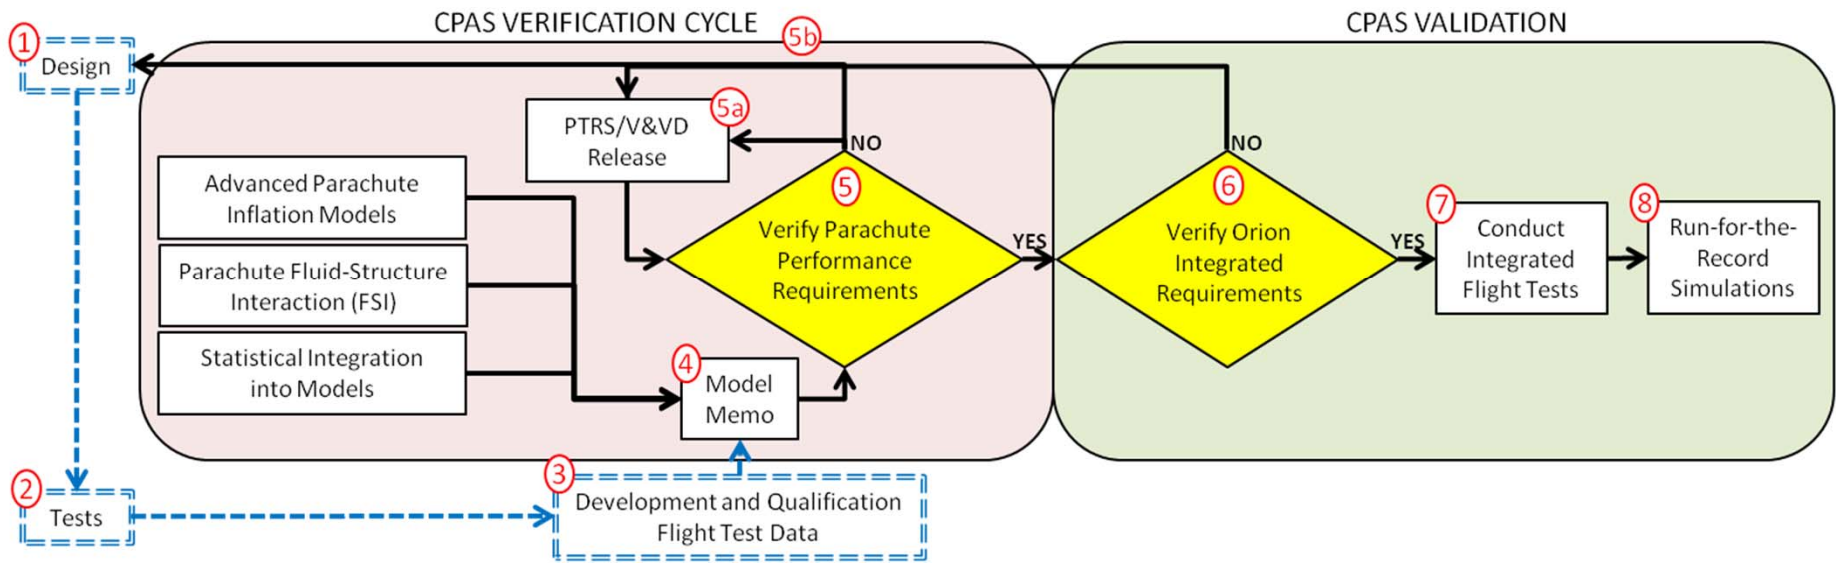

SYSTEM VERIFICATION

Capsule Parachute Assembly System (CPAS) - ESCG Analysis Team

CPAS Verification & Validation Cycle

- 1) Design the parachute subsystem
- 2) Test the design thought flight and ground tests
- 3) Development and Qualification test data is gathered
- 4) Document the test data and advancements in parachute physics knowledge
- 5) Verify the parachute subsystem meets flight performance requirements
 - a) If No, update the document for requirement clarification
 - b) If No, update the design so that it can meet the requirement
- 6) Validate flight performance requirements at the integrated Crew Module level
- 7) Conduct integrated flight tests
- 8) Run-for-the-record simulations

Capsule Parachute Assembly System

DSS Credibility Assessment Score (CAS)

Capsule Parachute Assembly System

Level	Verification	Validation	Input Pedigree	Results Uncertainty	Results Robustness	Use History	M&S Management	People Qualifications
4	Numerical error small for all important features.	Results agree with real-world data.	Input data agree with real-world data.	Non-deterministic & numerical analysis.	Sensitivity known for most parameters; key sensitivities identified.	De facto standard.	Continual process improvement.	Extensive experience in and use of recommended practices for this particular M&S.
3	Formal numerical error estimation.	Results agree with experimental data for problems of interest.	Input data agree with experimental data for problems of interest.	Non-Deterministic analysis.	Sensitivity known for many parameters.	Previous predictions were later validated by mission data.	Predictable process.	Advanced degree or extensive M&S experience, and recommended practice knowledge.
2	Unit and regression testing of key features.	Results agree with experimental data or other M&S on unit problems.	Input data traceable to formal documentation.	Deterministic analysis or expert opinion.	Sensitivity known for a few parameters.	Used before for critical decisions.	Established process.	Formal M&S training and experience, and recommended practice training.
1	Conceptual and mathematical models verified.	Conceptual and mathematical models agree with simple referents.	Input data traceable to informal documentation.	Qualitative estimates.	Qualitative estimates.	Passes simple tests.	Managed process.	Engineering or science degree.
0	Insufficient evidence.	Insufficient evidence.	Insufficient evidence.	Insufficient evidence.	Insufficient evidence.	Insufficient evidence.	Insufficient evidence.	Insufficient evidence.
	M&D Development		M&S Operations			Supporting Evidence		

FUTURE OF CPAS

Future of CPAS

➤ Testing

- EDU (plan as of Feb 6, 2013)
 - 2013: 3 tests – 2 PTV, 1 PCDTV
 - 2014: 5 tests – 4 PTV, 1 PCDTV
 - Includes first Forward Bay Cover (FBC) test
 - 2015: 2 tests – 2 PTV
- EFT-1 in fall 2014

➤ CDR

➤ Qualification Tests

Lockheed Martin's MPCV

➤ Simulation & Model development

- Transition to end-to-end simulation in an independent parachute model
- Time varying ROD model using fly-out angles
- Refinement of statistically derived dispersions

BACKUP

Parachute Deployment Envelope

Capsule Parachute Assembly System

Gen I Helicopter Tests

- Helicopter tests were simple to execute and analyze
- Test Conducted
 - Pilot Development Tests (PDT)
 - Vehicle used: SDTV
 - Drogue Development Tests (DDT)
 - Vehicle Used: MDTV
- Programmer parachute set up the desired dynamic pressure
 - Poor understanding of programmer drag lead to a failure to achieve the desired test condition

Small DTV Suspended
Beneath UH-1

Gen I LVAD Platform with Weight Tub

- Low Velocity Aerial Delivery (LVAD)
 - Certified US Army cargo aircraft extraction method
 - Uses a Type V platform and standard Army extraction parachute
- Short Platforms (12 ft by 9 ft platform)
 - Significant pitch under the programmer by $\sim 180^\circ$
 - Pilot or Main parachute slings could have been severed
 - Near-failure causes
 - Unstable & not well-characterized aerodynamics
 - Programmer trailing distance from platform
 - Changed on MDT-2 with no significant stability increase
 - Programmer size

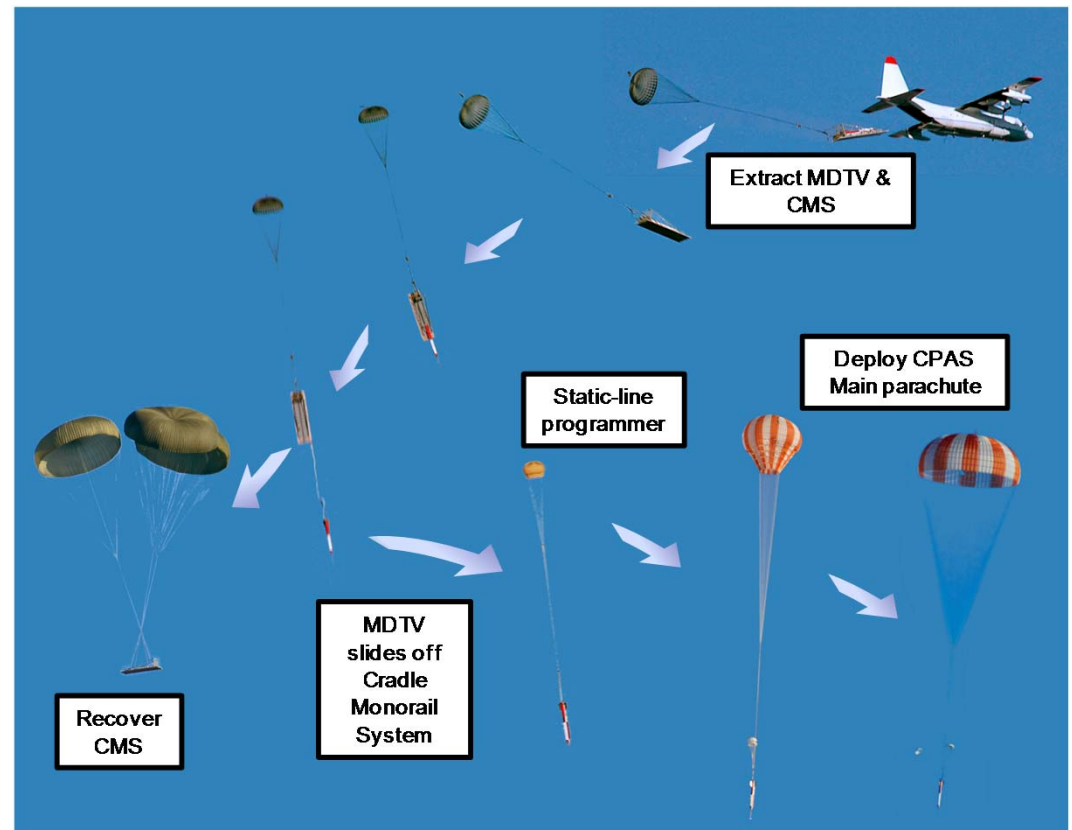

MDT-1 During Main Deploy

Gen I/II Missile Shaped Vehicles

- Cradle Monorail System (CMS)
 - Allowed the MDTV to be deployed by a C-130A aircraft
 - Constructed on a 32 ft by 9 ft Type V platform to use the LVAD extraction technique
- No separation simulation created
 - Used low fidelity analysis methods and engineering judgment
 - Separation occurred at the time of lowest dynamic pressure predicted in preflight simulations
 - Assumed an instantaneous separation
 - Post-test analysis proved that separation occurs in 1.5 seconds

Summary of Generation II Tests

Test Name	Number of Parachutes			Vehicle Type	Primary Test Objective
	Programmer	Drogues	Mains		
MDT-2-1	1 Drogue	1	1	MDTV/CMS	Main skipped 1 st reefing stage
MDT-2-2	1 Drogue	1	1	MDTV/CMS	Main skipped 2 nd Stage
MDT-2-3	0	1	1	MDTV/CMS	Increased Main Porosity
CDT-2-1	0	2	2	Weight Tub	Main Modified Line Length
CDT-2-2	0	2	2	Weight Tub	Increased Main Porosity
CDT-2-3	0	2	3	Weight Tub	Increased Main Porosity

MDT – Main Development Test
 CDT – Cluster Development Test

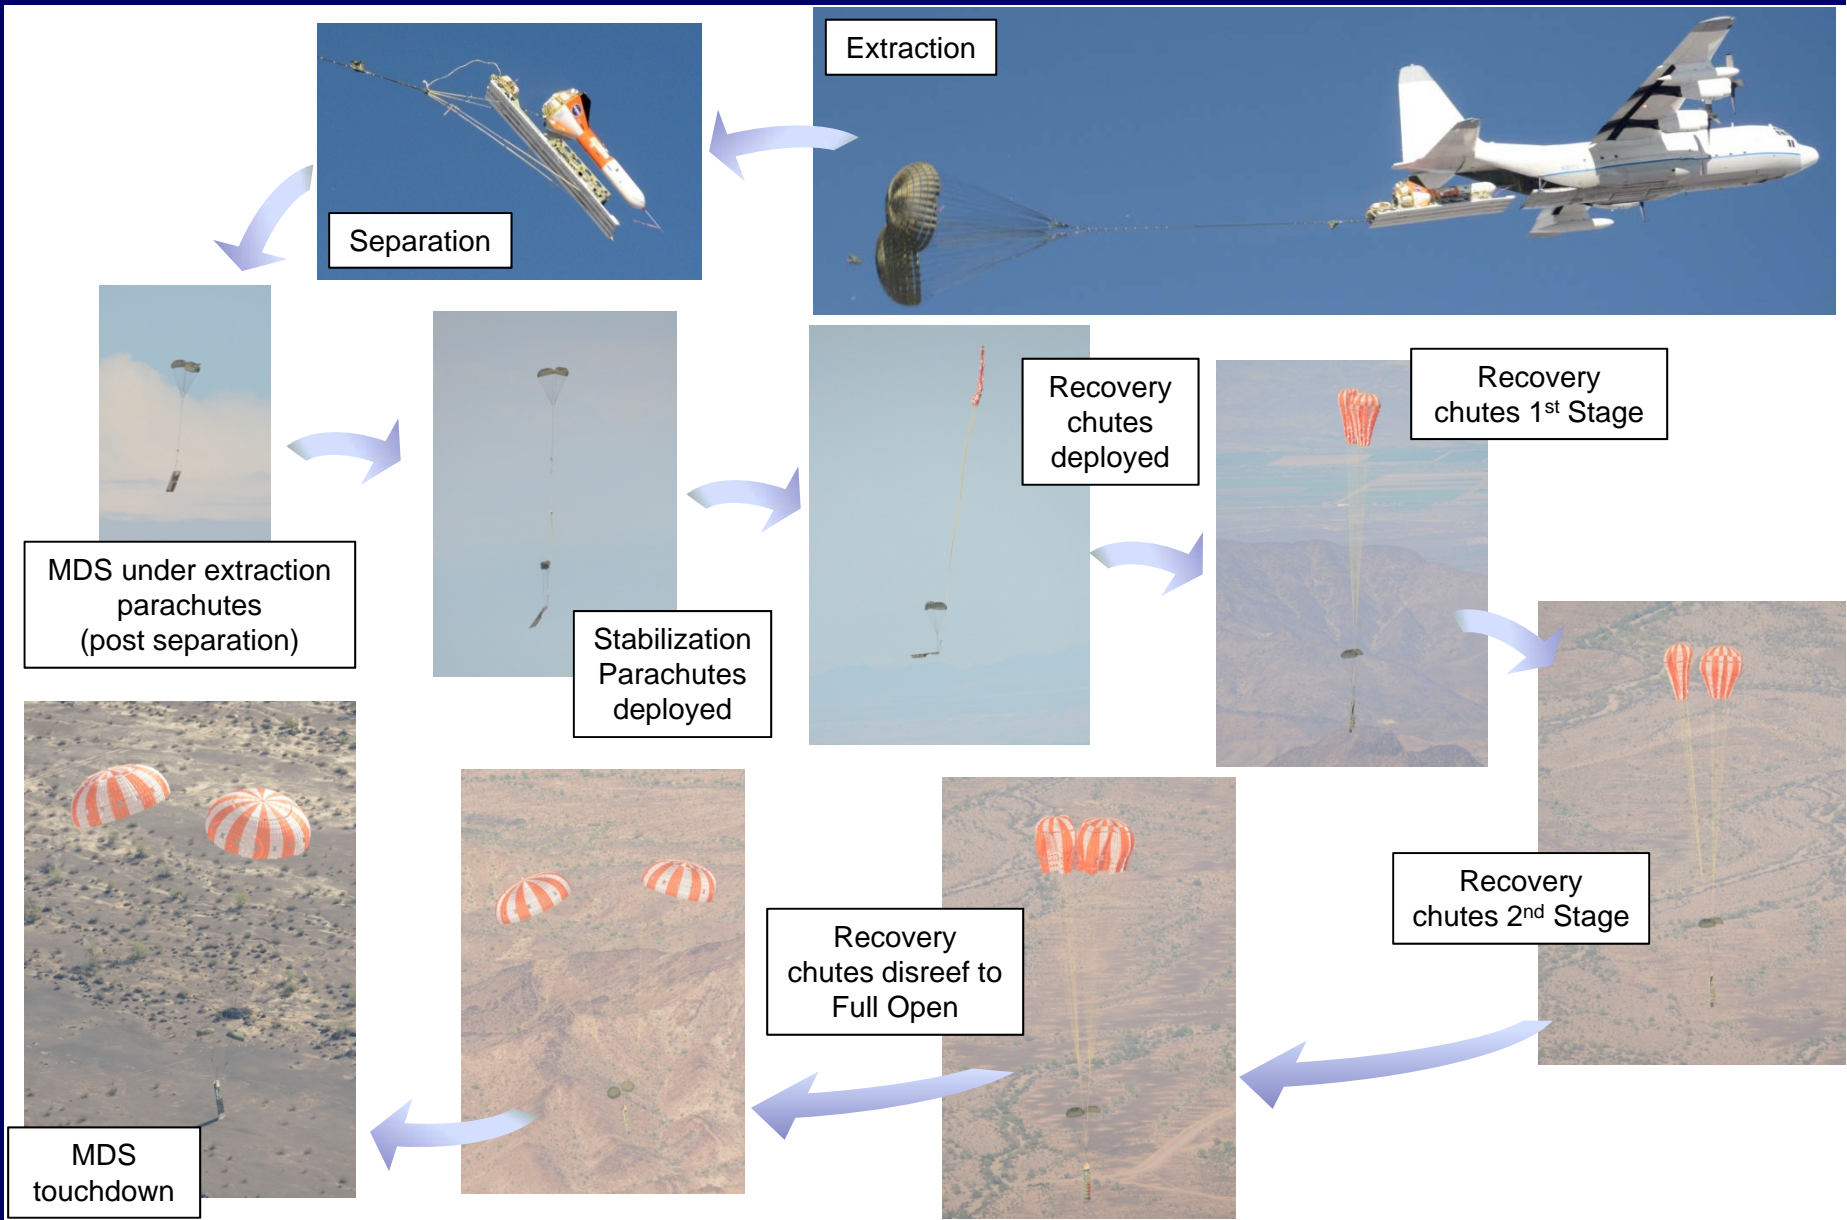

MDTV – Medium Drop Test Vehicle
 CMS – Cradle Monorail System

Trajectory Simulations

- **CAPSIM & PalletSIM**
 - Used to independently model two-vehicle systems post separation
 - Not used in EDU test phase
- **DSS**
 - High fidelity 6-DOF trajectory simulation
 - Does not have multi-body capability
 - Uses a composite model approach to simulation parachute clusters
- **ADAMS**
 - Commercial multi-body simulation
 - Models contact forces between bodies
 - Used for EDU extraction and separation phases
- **Flight Analysis and Simulation Tool (FAST)**
 - 6-DOF multi-body trajectory simulator
 - Utilizes Lockheed Martin developed hi-fi parachute model
 - Currently being phased in as primary tool for preflight predictions

CAPSIM GUI

ADAMS Overlay

Trajectory Simulations

- Decelerator Simulation System Application (DSSA)
 - Provides end-to-end 6-DOF simulations of Type V LVAD tests
 - Includes an aircraft extraction model
 - Uses DSS parachute model
- DTV-Sim
 - 2-DOF simulation without an aircraft extraction model
 - Provides a point mass trajectory of any vehicle type
 - Uses DSS parachute model

The DSSA GUI displays various simulation parameters and a diagram of the extraction mechanism. The diagram shows a carrier aircraft on a ramp with an extraction chute and EFTC (Extraction Force Transfer Coupling) mechanism. Labels include 'Extraction Chute', 'Load Transfer', 'EFTC', and 'Rear Of Platform To End Of Ramp'.

Variable	Value	Units
Altitude MSL	25000.00	(ft)
Airspeed	145.00	(kias)
Time final	150.00	(sec)
Altitude final	1300.00	(ft-MSL)
Landing site altitude	1300.00	(ft-MSL)
Rear Of Platform To End Of Ramp	16.00	(ft)
Ramp spring constant	5857.10	(lb/ft)
Ramp damping constant	44.29	(lb-sec/ft)
Ramp pitch motion factor	0.10	(0 - 5)
Carrier aircraft initial pitch	4.00	(deg)
Length of EFTC arm	16.00	(in)
Distance to front of platform	6.08	(ft)
G-load to trigger first motion	0.50	(G's)

DSSA GUI

The DTV-Sim GUI displays a table of simulation parameters. The table includes columns for Description, Variable, and Value.

Description	Variable	Value	Value	Value	Value
% TITLE (PDT3) reconstruction	Title				
CPAS MDS - 1 Main CPAS Parachute	Version	17			
% INIT1 *** INITIALIZE	INIT1				
Tinit (sec) Simulation Starting Time	Tinit	0			
Dt (sec) Simulation Integration Step	Dt	0.04			
Plot Dt (sec) Plot Output Frequency	plotDt	0.04			
Thrust Dt (sec) Simulation Integration Step	ThrustDt	0.04			
Tfinal (sec) Simulation Stop Time	Tfinal	700			
% INIT1 *** VEHICLE INITIAL CONDITIONS...	Init.1				
Xpos (ft) Vehicle Horizontal Position at	xo	0			
Pitch (deg) Vehicle Pitch at Start Time	pi0	-22.9734			
Zpos (ft) Vehicle Vertical Position at Start	zo	24668.92			
Xdot (ft/sec) Vehicle Horizontal Velocity at	xd0	171.6526			
PITdot (deg/sec) Vehicle Pitch Rate at	pitd0	-11.3228			
Zdot (ft/sec) Vehicle Vertical Velocity at	zd0	-121.5007			

DTV-Sim GUI

Parachute Parameters

Factor	Definition
C_D	Drag coefficient (of full open parachute)
n	Canopy fill constant
expopen	Opening profile shape exponent
C_k	Over-inflation factor
t_k	Time to ramp down after stage over-inflation

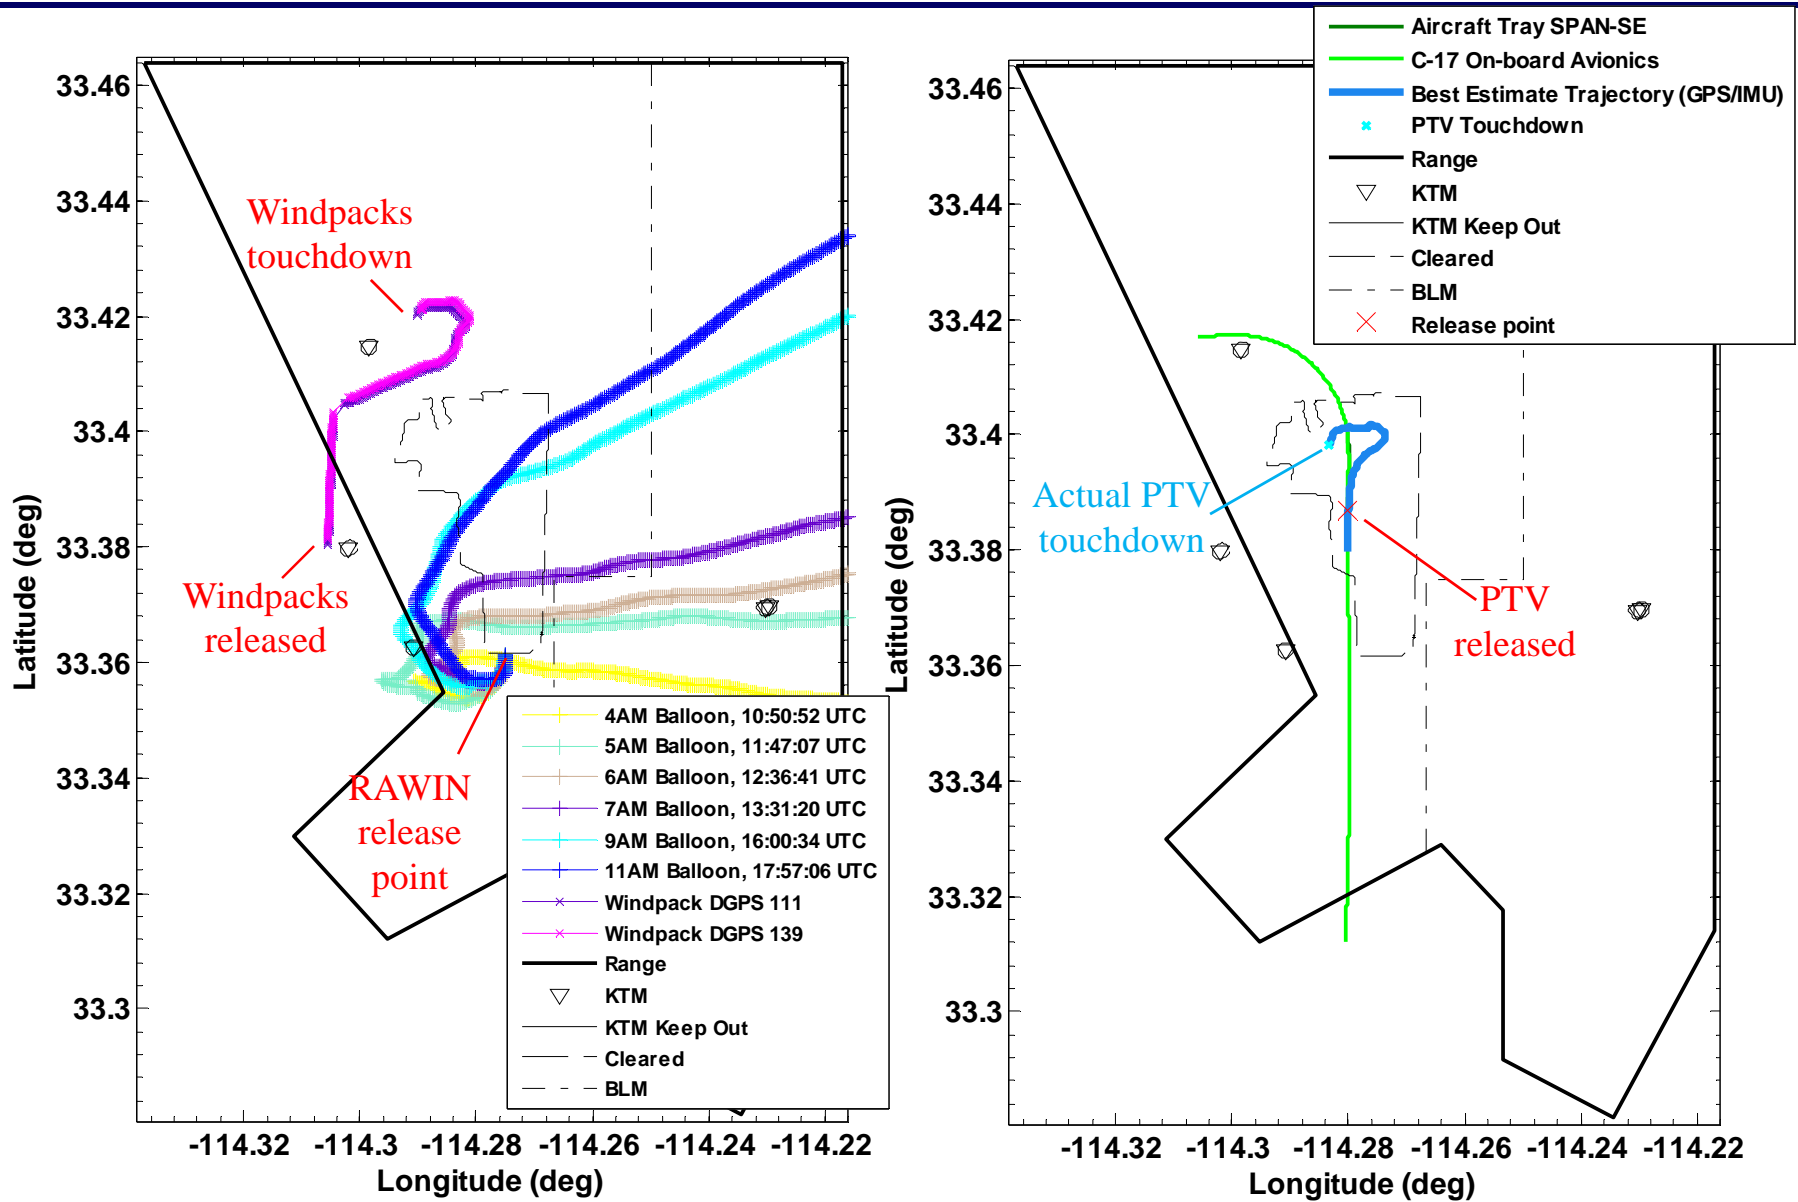

Day of Flight Simulations & Lessons Learned

- Wind data
 - Preflight predictions are done concerning wind contingency release altitudes
 - Wind measurements gathered hourly from RAWIN balloons
 - Balloon data is input into Sasquatch to determine the test article footprints
 - Ground winds can cause parachute and test vehicle damage
 - Tests are timed to occur immediately after sunrise when winds are at a minimum
- Release altitudes
 - Gen I and II data showed higher than planned release altitudes
 - Changes were made to provide the air crew with an indicated pressure altitude instead of the previously used geometric altitude
 - Tests have shown that this procedure causes vehicles to be dropped at the planned altitude

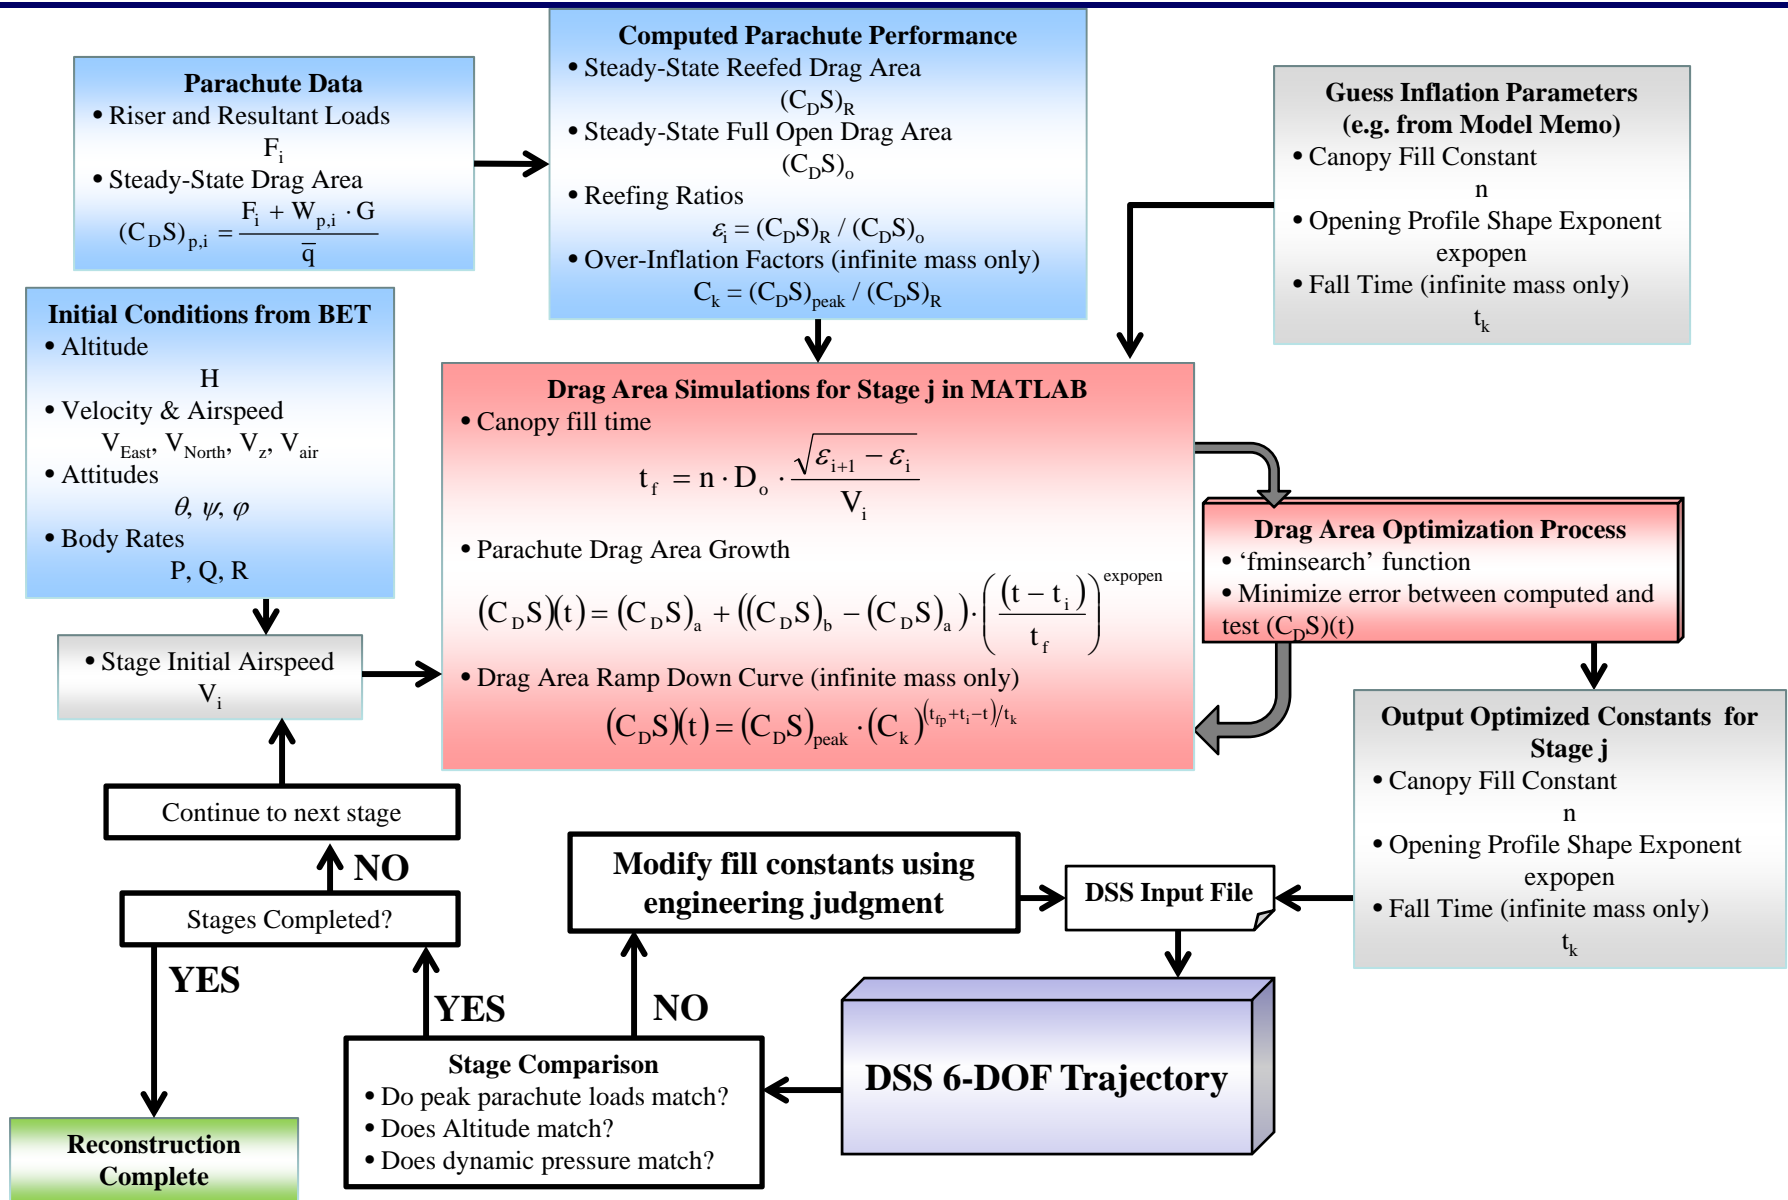

Map of Soundings and PTV Flight

Parachute Reconstruction Process

CPAS Flight Performance Requirements

- Probability of meeting requirements
 - Loads
 - Probability per table with 50% confidence
 - ROD (planned for Rev C)
 - 99.87% probability of meeting the requirement with 90% confidence
 - Torque (planned for Rev C)
 - 99.87% probability of meeting the requirement with 90% confidence
- Necessitates the use of statistical assessments

Chute Loads	Reference Mission	Case	Probability of Meeting Design Limit Load
Drogue Loads	High altitude abort/entry	Nominal	0.9987
		One-drogue failure	0.9773
	Low altitude/pad aborts	Nominal	0.9773
		One-drogue failure	0.8413
Main Loads	High altitude abort/entry	Nominal	0.9987
		One-main failure	0.9773
		One-drogue failure	0.9773
		One-main and one-drogue failure	0.8413
	Low altitude/pad aborts	Nominal	0.9773
		One-main failure	0.8413
		One-drogue failure	0.8413
		One-main and one-drogue failure	0.8413

Uniform Dispersions

- Previous Model Memos included uniform dispersions
 - Design dispersions – maximum and minimum seen in test
 - Flight test dispersions – engineer factor around design dispersions
 - 5% for $C_D S$
 - 10% for other parameters

Further Updates to Statistical Dispersions
