

Sub-seabed CO₂ storage: Impact on Marine Ecosystems

Outline

- Background
- ECO₂ consortium
- Project objectives and aims
- Project structure
- Study sites
- Research and policy needs

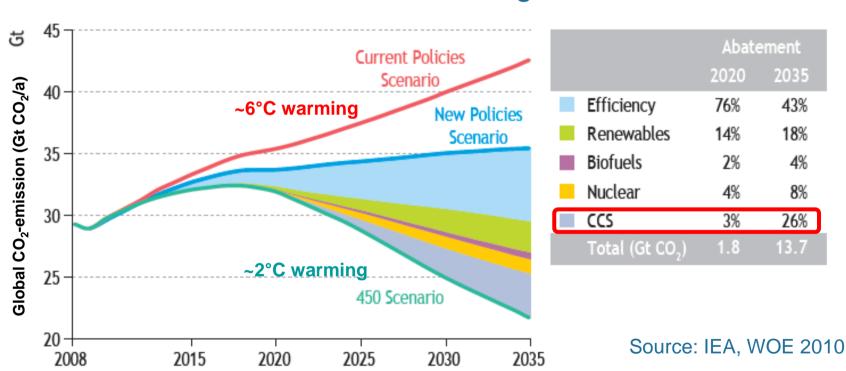

- The global community agreed to limit the increase in mean global surface temperature to 2 °C. To this end CO₂ emissions at power plants and other industrial facilities have to be reduced massively.
- This aim can not be achieved by a single technology but only by the deployment of a technology portfolio including improved energy efficiency, renewable energies and CCS.
- CCS is a relatively cost efficient technology that may help to reduce the costs of CO₂ avoidance in a balanced mitigation portfolio.

Background – Why CCS?

How can we achieve the 2°C target?

Several studies show that abatement of costs can be reduced by ~70% by applying CCS at large scale.

Sub-seabed CO2 storage: Impact on Marine Ecosystems

Background - CCS in Europe

The EC has recently selected 6 CCS demonstration projects and allocated
 €1 bn to support the implementation of these projects. Three of these
 projects intend to store CO₂ below the seabed (Hatfield, U.K.; Rotterdam,
 NL; Porto Tolle, I).

Sub-seabed CO2 storage: Impact on Marine Ecosystems

Background – CCS in Europe

- Up to 10 additional demonstration projects will be selected by the EC in 2011 with a total allocation of ~€3 bn to support these projects.
- U.K. committed £1 bn to initiate CCS demos at national level. The first large-scale CCS power plant project will be build in Scotland. CO₂ will be stored offshore in depleted oil reservoirs.

ECO₂ project and consortium

www.eco2-project.eu

- The ECO₂ consortium consists of 24 research institutes, one independent foundation (DNV), and 2 commercial entities (Statoil AS and Grupa Lotos)
- From nine European countries (Germany (8), Norway (5), U.K. (5), Italy (2), The Netherlands (2), Poland (2), Belgium (1), Sweden (1), France (1))
- The project is coordinated by Prof. Klaus Wallmann from IFM-GEOMAR, Germany
- The EC allocated €10.5 million to the ECO₂ consortium
- Project start 1st May 2011, project end 30th April 2015

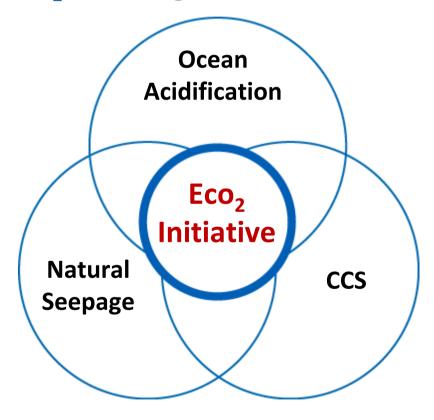

ECO₂ project

ECO₂ is a merger of three different scientific communities

to evaluate the likelihood, ecological impact, economic and legal consequences of leakage from sub-seabed CO₂ storage sites.

0 0

- To investigate the likelihood of leakage from sub-seabed storage sites
- To study the potential effects of leakage on benthic organisms and the marine ecosystems
- To assess the risks of sub-seabed carbon storage
- To develop a comprehensive monitoring strategy
- To define guidelines for best environmental practices in implementation and management of sub-seabed storage

ECO₂ research structure

WP1	Caprock integrity
WP2	Fluid and gas flux across the seabed
WP3	Fate of emitted CO ₂
WP4	Impact of leakage on ecosystems
WP5	Risk assessment, economic & legal studies
WP6	Public perception
WP7	Coordination & Data Management
CCT1	Monitoring techniques & strategies
CCT2	Numerical modelling

Page 11

Best environmental practices

International collaboration

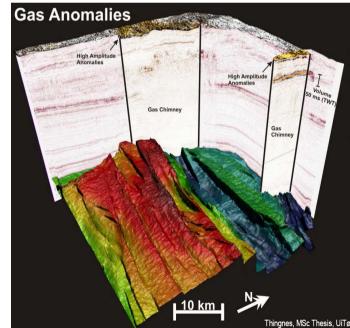

WP1 Architecture and Integrity of the Sedimentary Cover at Storage Sites

- Characterize the sedimentary cover to better assess CO₂ migration mechanisms and pathways
- Provide a catalogue of possible leakage scenarios and their likelihood of

occurrence.

Constrain potential leakage locations and rates

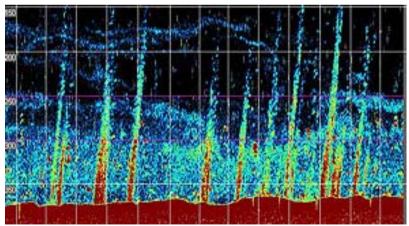

WP2 Fluid and Gas Fluxes across the Seabed

- Identify effective tracers of leakage from storage sites
- Assess the potential for mobilization of toxic metals and CO₂ hydrate formation
- Provide numerical models that can be applied to predict fluxes of CO₂
 and other chemical species

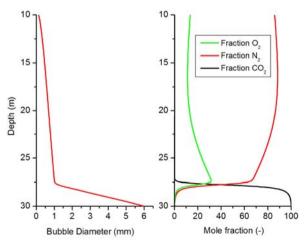

WP3 Fate of CO₂ and other Gases emitted at the Seabed

- Understand CO₂ transport mechanisms and biogeochemical transformation in the water column
- Quantify CO₂ leakage in the water column; detect precursors
- Develop best practices for monitoring oceanic waters and fingerprinting
 CO₂ leakage

Sub-seabed CO2 storage: Impact on Marine Ecosystems

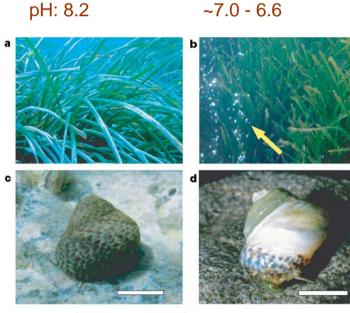

WP4 Impact of Leakage on Benthic Organisms and Marine Ecosystems

- Quantify the consequences of short, medium, and long term CO₂ leakage
- Assess the ability of organisms and communities to adapt to elevated CO₂ levels
- Identify biological indicators & monitoring techniques to detect CO₂ seepage

Potential environmental effects of leakage

- Benthic ecosystems at CO₂ leaks may be affected by local acidification and the release of toxic substances dissolved in formation fluids.
- Pelagic ecosystems could be affected by seawater acidification if large scale leakage would occur.
- Atmospheric pCO₂-values might increase under extreme leakage scenarios.

WP5 Risk Assessment, Economic, Legal Studies Policy Stakeholder Dialogue

- Conduct an Environmental risk assessment (entire operational life cycle) & estimate the potential costs (compare benefits and financial risks)
- Review existing legal framework associated with CCS
- Communicate the knowledge produced in ECO₂ to relevant stakeholders

WP6 Public Perception Assessment

- Standardize commonly used terms & concepts in CCS research
- Identify the core factors and processes that influence public perception of CCS
- Provide guidance on how to devise and implement effective public stakeholder communication plans to meet public information needs and concerns

WP7 Coordination and Data Management

- Provide effective management and archiving of ECO₂ generated data
- Provide effective project management for ECO₂ including communication, integration, dispute management, networking and administrative support
- Disseminate ECO₂ results

CCT1 Monitoring Techniques and Strategies

- Coordinate the development of monitoring technologies within ECO₂
- Develop guidelines for innovative and cost-effective strategies to detect and quantify leakage

CCT2 Interfacing of the Numerical Models

- Identify model synergies, overlaps and interfaces and development of appropriate computational coupling
- Quantify and evaluate the geological, physical, chemical and ecological risks

CCT3 International Collaboration

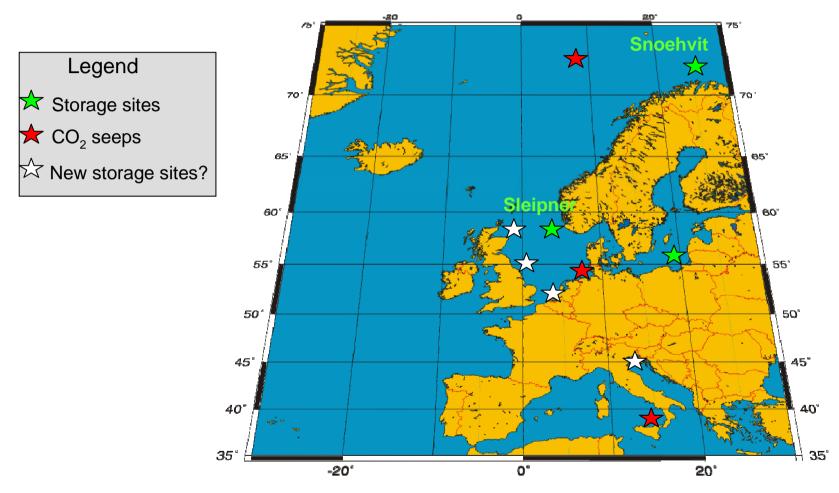

- Enhance the international profile of EU environmental CCS research in general, and the ECO₂ consortium in particular
- Collaboration with: Australian, Japanese and US CCS research groups

CCT4 Framework of BEP in the Management of Offshore CO₂ storage

- Develop a generic environmental risk assessment document
- Conduct a framework of BEP in the preparation and management of offshore storage sites; review and test applicability

Sub-seabed CO2 storage: Impact on Marine Ecosystems

Research and policy needs (bioscience perspective)

- Determine the sensitivity and resilience of benthic organisms towards enhanced CO₂ values in bottom waters and pore waters.
- Identify indicator organisms featuring a strong response to elevated CO₂
 levels
- Characterize and model the effects of CO₂ leakage on benthic and pelagic organisms and ecosystems for different CO₂ emission rates
- identify sensitive areas in the European EEZ that should be excluded from off-shore CO₂ storage activities (potential marine protected areas).
- Define a maximum permissible CO₂ leakage rate from an ecosystem perspective
