Abstract
Taking a decision made by a person in any case greatly affects to the next steps and consequences, no exception in taking decision to be sharia bank customer. This study aimed to investigate the effect of perception of sharia banking towards decision making to be sharia bank customer. This research used descriptive quantitative research. The research result shows that there is an influence the level of perception in decision making to, it showed by the result of simple regression, $\beta = 28.6\%$; $t = 11.200$. The conclusion of this study is there is an effect of people perceptions of sharia banking towards decision making to be sharia bank customer.

Keywords: Decision, Perception, Sharia Banking

INTRODUCTION
Taking a decision made by a person in any case greatly affects the next steps and consequences. Therefore, in taking a decision is necessary some considerations and thoughtful maturity. No exception when choosing a bank to save money or find a fund. As a society in the era of globalization must be smart in choosing. Determination of decisions on the basis of how to know and understand and his perception of bank.

Indonesia is one of the countries with the largest Moslem population in the world with 207,176,162 people (bps.go.id, 2010). However, not all Moslems follow the Islamic Shari’a, as in the case of muamalah or transaction. Reporting by beritasatu.com (2015), the number of customers of sharia banks in Indonesia is only 18.75 percent of conventional bank customers that reach 80 million people. According to research conducted by the Otoritas Jasa Keuangan (OJK), sharia banking is still not widely known in Indonesian society. Market share of this bank is approximately 4.8 percent of market share of conventional banking. Perception plays an important role for the community in realizing and understanding of sharia banks. With these people’s perceptions they then choose actions and attitudes or decide whether to become customers of sharia banks or not. However, Islamic banks today have begun to feel after the law No 10 of 1998 on the amendment of Law no. 7 of 1992 concerning banking recognizes the existence of conventional banks and sharia banks side by side (dual banking system). The law reinforces the potential of sharia banks to further develop as potential financial institutions. This is supported by the issuance of Act Number 23 of 1999 concerning Bank Indonesia which was then amended to become Act No. 3 of 2004 (BI Law). The enactment of this Law enables the implementation of monetary policy based on sharia principles.
The number of sharia banks in Indonesia is not as much as conventional banks, only 25 banks, although the growth of Islamic banks can be said to continue moving up (sindonews.com, 2017). The details are 13 Bank Umum Syariah (BUS), Unit Usaha Syariah (UUS) and 12 Bank Pembiayaan Rakyat Syariah (BPRS). Its growth in 2015 has reached 10% compared to December 2014 (www.republika.co.id). By the growth of sharia banking, it is expected that many people will decide to become customers in sharia banks.

Yogyakarta is one of the areas in Indonesia that has good development and prospects for the growth of sharia banking. Obtained from Republika.id (2011) Market Share about 5.8 percent or higher than the National average. Therefore, the researchers are interested to examine the public perception of sharia banking in making decision to become customers of sharia banks.

Based on the background above, the problems can be formulated as follow:
"How is the influence of the perception of sharia banking on the decision to become customers of sharia bank in Yogyakarta society?". To know the influence of peoples’ perception of sharia banking on making decision to become customers of sharia bank of Yogyakarta society.

**LITERATURE REVIEW**

**Decision Making Becoming a Sharia Bank Customer**

Based on Salusu (2004) Decision making is a process of choosing an alternative way of acting with an efficient method according to the situation. Hill et al reveals that when a decision has been made, something new begins to happen. In other words, accelerated decisions are taken action, and encourage make of movement and change. Meanwhile, according to Desmita (2008), decision-making is one form of thinking and the results of a deed.

Decision-making is a process of thinking to choose alternative ways or actions that will further encourage a movement or action of the decision. The decision to be a customer of sharia bank is an individual thinking process in choosing an action to be a customer of sharia bank or not. In making these decisions, of course, the first identification of selected sharia banks is required.

**Public Perceptions of Sharia Banks**

Perception is a direct response or acceptance from a person. According Jalaludin Rackhmat (2011: 50) perception is the experience of the objects, events, or relationships obtained by concluding information and interpret the message. Meanwhile, according to Bimo Walgito (2002: 87) perception is a process preceded by sensing the process of stimulus by individuals through the sensory process. But the process does not stop just like that, but the stimulus is forwarded and processed next is a process of perception. Perception is a process that begins with the stimulus process by the individual through a sensory process which will then be interpreted and concluded so that the individual can provide a response or action. Public perception on sharia banking is how society interpret and conclude from what they know.
about sharia banking which then society give response about syariah banking. One of the responses or actions taken is to decide whether to become an Islamic bank customer or not.

**Relevant Research**

From the author's search results related to the theme of research we do at least there are some references that the author can make references, among others.

First, research conducted by Ahmad Syauqi entitled "Pengaruh Persepsi Masyarakat Tentang Ke’Syariah’an Perbankan Syariah (Studi Pada Masyarakat Pamulang)". Second, Journal of Business Focus by Junaidi entitled "Persepsi Masyarakat untuk Memilih dan Tidak Memilih Bank Syariah (Studi Kota Palopo)" This research aim to know how big factor that can influence society in Palopo City to choose sharia bank.

From the above two references, there are similarities of the object with the research that will be done. But overall, the difference in this study lies in the dependent variable. In addition, case study (research site) is also different.

**RESEARCH METHOD**

**Design, Place and Time**

This research is based on the approach is a quantitative descriptive study conducted in Yogyakarta. The study period is May 2017 up to July 2017.

**Population and Sample**

The population in this study is the whole society of Yogyakarta that productive age and muslim. While the sample of research is determined by simple random sampling technique. The number of samples is determined by the method developed by Isaac and Michael with the error rate of 5%, N or the total population of 3,357,339 souls then obtained the number of samples 349 respondents (Sugiyono, 2011: 71).

**Data collection technique**

Questionnaire is a technique of data collection conducted by giving a set of questions or questions written to the respondent to answer it (Sugiyono, 2015: 199). This study used close questionnaire by using a modified Likert scale. The following table scales and scores:

<table>
<thead>
<tr>

**Test Instruments**

Validity is a measure that indicates the level of validity or validity of an instrument. The validity test used by Product Moment correlation formula from Pearson with the help of SPSS Statistic 20 program. The validity test result is consulted on one-way test table, with r table price at 5% significant level with n = 30 equal to 0.306. Question items are said to be valid when r count is greater than 0.306.
Reliability in this study was tested with Alpha Cronbach reliability with the help of SPSS Statistic 20. Criteria of an instrument is said to be reliable by using this technique that is when the reliability coefficient count ($r_{11}$) is greater than 0.600 then the instrument is said to be reliable, and vice versa if the reliability coefficient count ($R_{11}$) is smaller than 0.600 then the instrument is said not reliable.

**Data Analyze**

1. Test Prerequisites
   a. Normality Test
      Normality test aims to determine whether the data is normally distributed or not. Normality test using Kolmogorov-Smirnov formula using SPSS 20 software aid. To identify normal distributed data is to see the value of significance. If each variable has a value > 0.05 then the research variable is normally distributed.
   b. Linearity Test
      Linearity test is done to determine whether there is a relationship between independent variables and dependent variables. This test uses the help of SPSS 20 software.
   c. Multicollinearity Test
      Multicollinearity test is done to determine the relationship between independent variables. The existence of multicollinearity value is indicated by looking at the tolerance value ($\alpha$) VIF value (Varian Inflated Factor). If the tolerance value $\leq 0.10$ with VIF value $\geq 10$ then it can be said there is multicollinearity.
   d. Heteroscedasticity Test
      The purpose of the heteroscedasticity test is to test whether in variance regression occurs variance inequality from one observation residual to another. If the variance and residuals remain, then homocedastity occurs, so this regression model is a good regression model.

2. Statistic Test
   a. Simple Linear Regression Test
      Simple Linear Regression Test is used to test for causal relationship between one independent variable and one dependent variable. This test uses SPSS 20 program.
   b. T Test
      Used to test the hypothesis. If $t$ table is greater than the level of significance (0.05) then $H_0$ is rejected. This test uses SPSS 20 program.

**RESULTS**

This research was conducted in Yogyakarta on May 28, 2017 until July 08, 2017. While the data used in the study is the primary data obtained by distributing questionnaires to the community of Yogyakarta directly or online through google.doc application. The populations in this study are all people in Yogyakarta who are productive age (aged 17 to 60 years) and are Muslim about 197,432 people. The sample that used a number of 349 respondents.
However, in the execution, the number of returned and probable questionnaires is 315 questionnaires. The number of questionnaires is less than that should be caused by many people who do not want or refuse to fill in the questionnaire and declare the questionnaire is lost.

**Instrument Test**

Data processing to test the validity using SPSS Statistic 20 with Product Moment technique, it can be concluded that from 22 items of question for Y Variable there are 5 items that are not valid or fall, that number are 8, 13, 16, 18 and 20. As for X variable, from 19 items only one question that fall is the number 16. Test of instrument reliability in this research using Cronbach Alpha technique and obtained reliability coefficient or r11 on X variable equal to 0.925 and r11 at Y variable equal to 0.832. Both of them show that the value of r11> 0.6, it means reliable or consistent data.

**Test Prerequisites**

1. **Normality Test**
   Distribution of data in this study can be said as normal data (has normally distributed) if the results obtained are greater than the value of significance. The result of the Normality Test by using Kolmogrov-Smirnov Test by SPSS Statistic 20 application is 1.128. This result is greater than the error value set at 5% or 0.05, so the data is said to be normal distribution.

2. **Linearity Test**
   Linearity test using SPSS Statistic 20 with Test for Linearity obtained Deviation from Linearity of 0.498. These results indicate that between the variables of Public Perceptions and Decisions of Customers of Sharia Banks have a linear relationship because the Significance is greater than the error rate, 0.498> 0.05.

3. **Heteroscedasticity Test**
   The result of the heteroscedasticity test table using Glejser method with the help of SPSS Statistic 20 shows the significance value of 0.302. This means that the significance of more than 0.05 or no heteroskedasticity, in other words in the regression of variance inequality, so the conclusion of this regression model is a good regression model.

**Hipotesis Test**

From the results of the data obtained the equation $Y = 17.202 + 0.546X$. The constant of 17.202 means that if the Perception (X) value is zero (0) then the decision is positive value 12.202. The regression coefficient of public perception (X) is 0.546 meaning that if the perception increase 1, then the decision to become the customer of syariah bank will increase as big as 0.546.Koefisien is positive value meaning positive relation between society perception with decision to become customer of syaria bank, more positive perception of society Sharia banks then the more positive also the community decided to become customers of sharia banks. Other than that obtained probability value of 0.000 or less than
0.05 then the regression model can be used to predict the dependent variable (Y) namely the decision to become a customer of sharia bank. R Square from the calculation shows that the coefficient of determination of 28.6%. This means that 28.6% of the decision to become a customer of syariah bank can be explained by the public perception variable about sharia banking. While 71.4% is explained by other factors.

Hypothesis in this research is as follows:
H₀ = There is no influence between the perception of the people of Yogyakarta to sharia banking in making the decision to become a customer of sharia bank
H₁ = There is influence between the perception of the people of Yogyakarta to sharia banking in making the decision to become a customer of sharia bank

Testing criteria:
T < t table, then Ho is accepted
T count > t table, then Ho is rejected

The result of regression analysis shows the value of t count of 11.200. While t table for df ∞ with significance level of 5% and two-tailed test is 1.06 (Suharsimi, 2013: 406). It can be seen from the calculation results t count > t table so Ho is rejected, meaning there is a significant influence between the perception of the people of Yogyakarta to the Islamic banks in decision making to customers of sharia banks. So in this case it can be concluded that the perception of the people of Yogyakarta to the sharia bank has an effect on the decision making to become a customer of sharia bank.

CONCLUSIONS
Based on research that has been done about the influence of public perception of syariah banking in making the decision to become a customer of syariah bank can be drawn conclusion as follows:

1. Public perception of sharia banking has an effect on decision making to become sharia bank customer.
2. Public perception of sharia banking has a positive and significant influence in decision making to become customers of syaria bank by 28.4%.

Based on the results of research that has been done, the researchers provide suggestions as follows:

1. Islamic Bank
   It is expected that sharia banks pay more attention to public perceptions of sharia banks, by building a positive image of the community so as to give public confidence to use the products of sharia banks. Positive image will form a good perception as well, because the perception has an influence on the decision of the community in a sharia bank.

2. Next Research
   The next researcher is expected to examine other factors besides public perception towards syariah bank, because based on result of research more than 70% decision of society become customer of syaria bank influenced by other factor.
