NIRCam: 0.6-5 μm imaging + 2,4-5 μm spectroscopy

- NIRCam is the JWST near-infrared camera for JWST
 - Two nearly identical modules (A & B) with refractive designs to minimize mass and volume
 - Dichroic used to split range into short (0.6–2.3 μm) and long (2.4–5 μm) channels
 - Nyquist sampling at 2 and 4 μm
 - 2.2 arc min x 4.4 arc min total field of view seen in two colors (40 MPixels)
 - Coronagraphic capability for both short and long wavelengths (Chas Beichman talk)
 - Dispersive components in short and long channels allow *slitless spectroscopy*
- NIRCam is also the telescope wavefront sensor

NIRCam modes: selectable with wheels

No Short Wavelength Spectroscopic Capabilities in Cycle 1

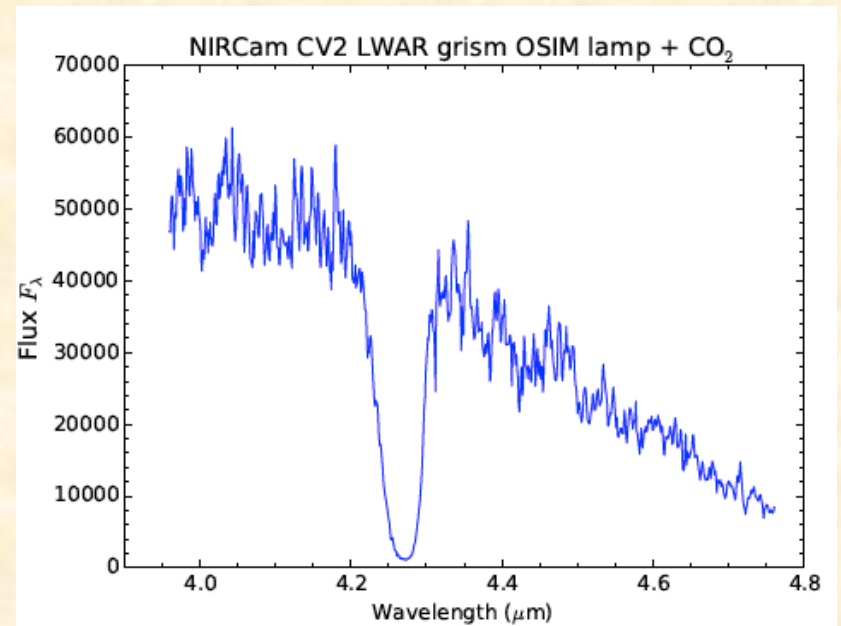

**2 LW grisms in each module provide $R \sim 1500$ slitless spectroscopy:
Chose dispersion orientation and filters to suit your science**

NIRCam LW Grism Spectra

Left: NIRCam spectral image of the OSIM super-continuum lamp point source taken with the LWA R grism and F444W filter during JWST instrument testing.

Right: Extracted spectrum. The continuum decreases toward longer wavelengths due to low fiber transmittance, and the broad feature near 4.27 μm is due to CO₂ absorption. These are artifacts of the test equipment and not NIRCam itself.

*** NIRCam FOV is 2.2 x 2.2 with dispersion of 10 \AA per 0."065 x 0."065 pixel ***

NIRCam Spectral Coverage & Resolution

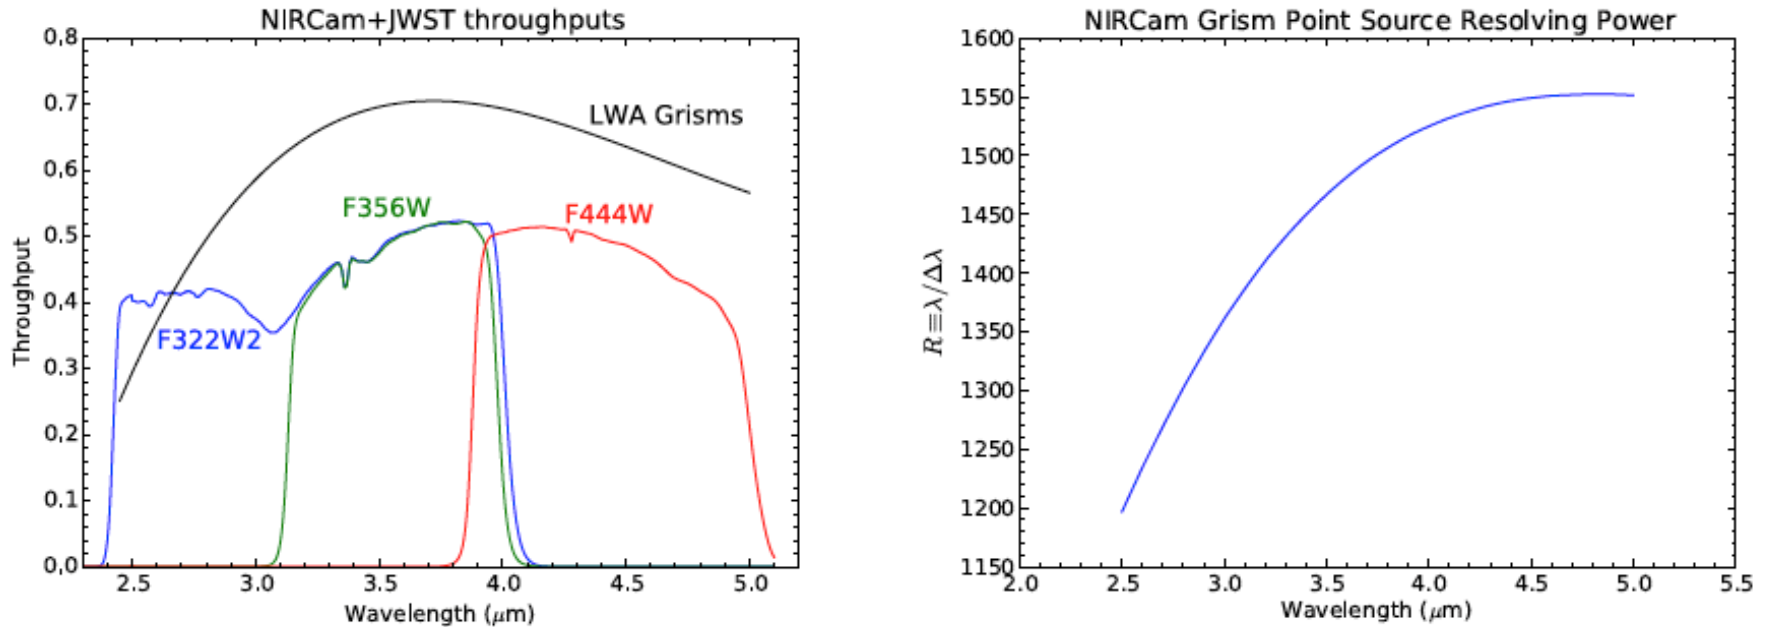

Figure 3. Left: Total system throughput including all OTE and NIRCam optics and the detector quantum efficiency for several NIRCam filters. The theoretical LW grism efficiency curve (shown for the A module) must be multiplied by the filter curves to produce the system throughput at each wavelength. The Module B LW grisms are anti-reflection coated on only 1 side and therefore have throughputs approximately 25% lower than the LWA grisms. Right: Grism FWHM spectral resolving power vs. wavelength for point sources, limited by pixel sampling of the PSF at shorter wavelengths ($\lambda \lesssim 4 \mu\text{m}$) and limited by the circular beam factor⁷ and diffraction at longer wavelengths ($\lambda \gtrsim 4 \mu\text{m}$).

Time Series Wavelength (filter) Options

- The 2.4 – 5 μm region can be covered in as few as 2 separate filters:
 - F322W2: 2.4 – 4.0 μm
 - F444W: 3.9 – 5.0 μm

Table 2. Filters available for use with LW grisms in Cycle 1

Filter Name ^a	λ_1 (μm) ^b	λ_2 (μm) ^c	# dispersed pixels	# pixels/2048 ^d	Mode ^e
F277W	2.416	3.127	711	0.35	TS + WF
F322W2	2.430	4.013	1583	0.77	TS + WF
F356W	3.140	3.980	840	0.41	TS + WF
F444W	3.880	4.986	1106	0.54	TS + WF

^a All LW M filters will also likely be available in wide-field mode; F430M and F460M are expected to be popular and are included for illustrative purposes

^b Half-power wavelength (blue side)

^c Half-power wavelength (red side)

^d Fraction of the detector that a continuum spectrum occupies in the dispersion direction

^e TS = single-object time series and WF = wide field modes

Module A Grism Saturation & Sensitivity

λ (μm)	F_{cont} ($\mu\text{ Jy}$) ^b	F_{line} (W m^{-2}) ^c	K_{sat} (A0V) ^d	K_{sat} (M2V) ^d	Filter ^e
2.5	11.1	1.09E-20	4.3	4.3	F322W2
2.7	8.7	7.35E-21	4.5	4.6	F322W2
2.9	8.0	5.98E-21	4.3	4.5	F322W2
3.1	7.9	5.22E-21	4.2	4.4	F322W2
3.3	6.7	3.97E-21	4.2	4.5	F322W2
3.5	6.5	3.45E-21	4.0	4.3	F322W2
3.7	6.3	3.05E-21	3.9	4.2	F322W2
3.9	7.0	3.11E-21	3.6	3.9	F322W2
4.1	12.1	4.99E-21	3.5	3.8	F444W
4.3	13.5	5.18E-21	3.2	3.5	F444W
4.5	15.1	5.38E-21	2.9	3.0	F444W
4.7	19.1	6.38E-21	2.5	2.7	F444W
4.9	25.1	7.88E-21	2.2	2.3	F444W

- a. Module B grisms will have sensitivities approximately 1.16 times higher (worse) and saturation limits 0.33 mag brighter.
- b, c 10 σ point-source and unresolved emission line sensitivities for 10,000 s integrations
- d K-band Vega magnitudes for saturation (80% full well or 65,000 electrons) for 0.68 s integrations (2 reads) of 2048 x 64 pixel regions in stripe mode (4 outputs).
- e Narrower filters will have similar saturation values and somewhat better sensitivities

Sensitivities are ~2-5x worse than NIRSpec depending on filter bandpass and zodiacal background

Time Series Spectroscopy APT Template

NIRCam Grism Time Series Special Requirements Comments

Module: A Module can only be set to A for this template.

Subarray: SUBGRISM128

No. of Outputs: 4 Frame readout time is 0.67596

No. of Exposures: 1

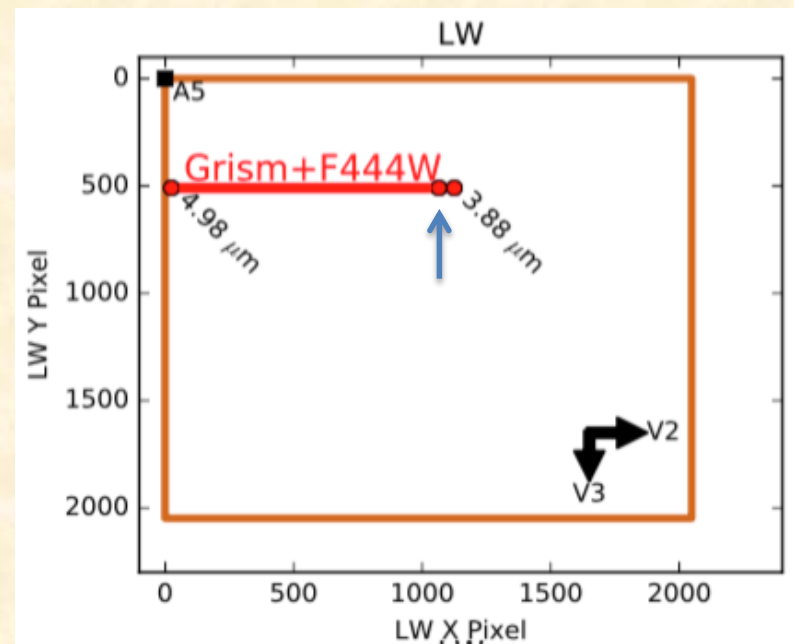

Short Pupil+Filter: WLP8+F210M

Long Pupil+Filter: GRISMR+F322W2

	Readout Pattern	No. of Groups	No. of Integrations	Photon Collect Duration	Total Photon Collect Duration
Exposure Time	RAPID	4	1000	2703.84	2703.84

- Can choose from 64, 128, 256, & 2048 x 2048 subarrays
- 1 or 4 outputs (4 for very bright stars)
- Simultaneous short wavelength imaging with weak lens to spread the light over many pixels is possible
- No dithering
- Flexible detector exposure and readout parameters

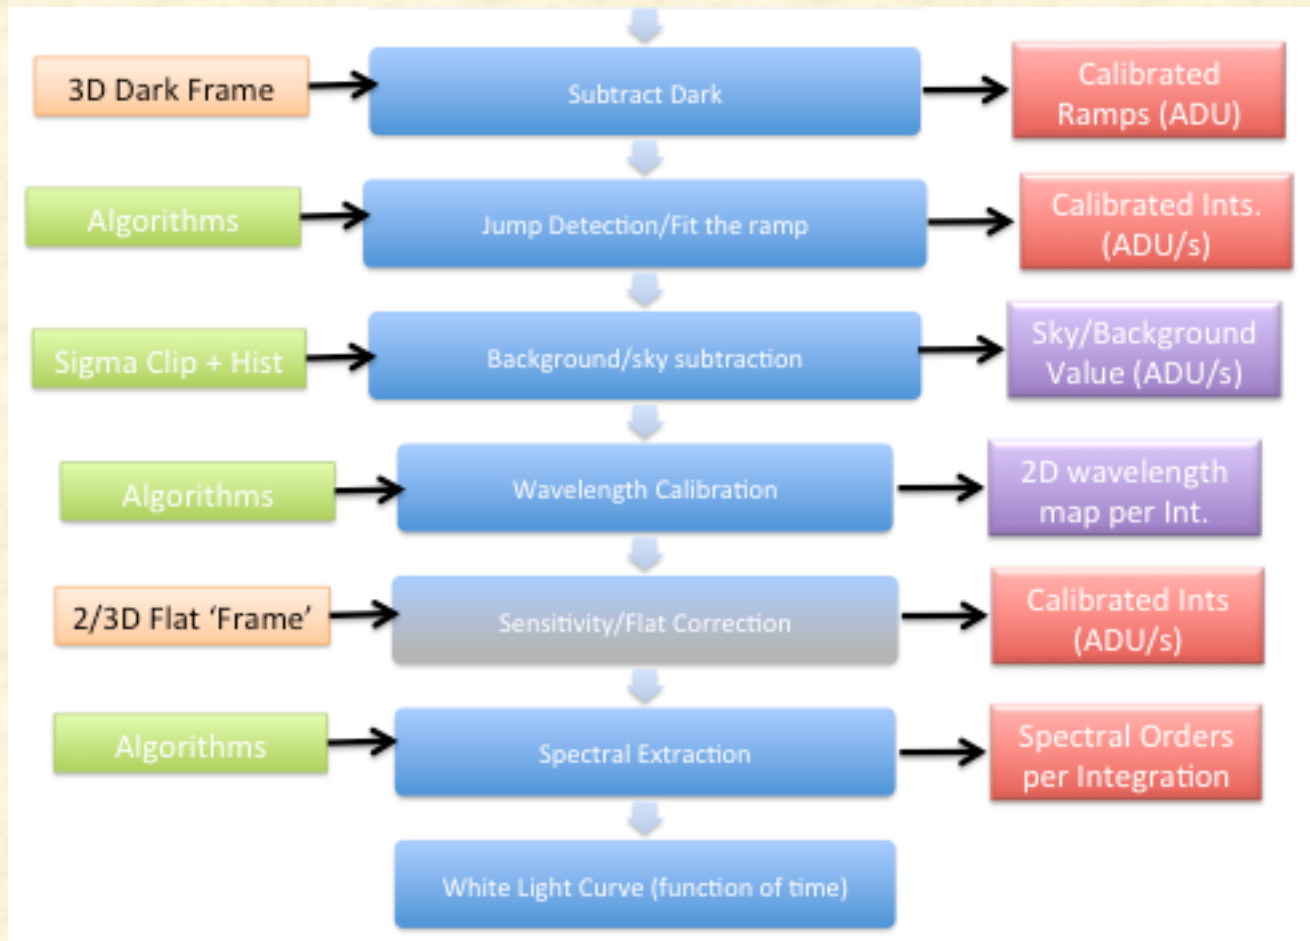

Target Acquisition & Spectral Pixels

**** Note: Field point positions may / will be revised before launch ****

- Target acquisition field points allow significant overlap of same pixels in F322W2 and F444W spectra
- Targets are positioned at the undeviated wavelength locations (blue arrow; $\lambda \sim 3.95 \mu\text{m}$)

NIRCam uses the JWST time-series data pipeline

- Users can download & re-run the pipeline with different options, additions, or removals
