

# Sixth-Order Two-Point Efficient Family of Super-Halley Type Methods

Ramandeep Behl, S. S. Motsa

**Abstract**—The main focus of this manuscript is to provide a highly efficient two-point sixth-order family of super-Halley type methods that do not require any second-order derivative evaluation for obtaining simple roots of nonlinear equations, numerically. Each member of the proposed family requires two evaluations of the given function and two evaluations of the first-order derivative per iteration. By using Mathematica-9 with its high precision compatibility, a variety of concrete numerical experiments and relevant results are extensively treated to confirm the theoretical development. From their basins of attraction, it has been observed that the proposed methods have better stability and robustness as compared to the other sixth-order methods available in the literature.

**Keywords**—Basins of attraction, nonlinear equations, simple roots, Super-Halley.

## I. INTRODUCTION

**E**FFICIENT solution techniques are required for finding simple roots of nonlinear equation  $f(x) = 0$ , which partake of scientific, engineering and various other models. One of the best known one-point optimal method is classical Newton's method [1], [2]. With the advancements of computer algebra, researchers [3]-[8], from the worldwide proposed three-point sixth-order methods that are known as the extensions of Newton's method at the expense of additional evaluations of functions, derivatives and changes in the points of iterations.

But, the body structures of these three-point sixth-order methods are not simple as compared to two-point methods [9], [10]. Further, it is not easy to find two-point methods whose order of convergence greater than four [11].

Therefore, our primary aim is to develop a new highly efficient two-point sixth-order family of super-Halley type methods, that do not require any second-order derivative. It is also observed that the body structures of our proposed methods are simpler than the existing three-point sixth-order methods. Further, our proposed methods are more effective in all the tested examples to the existing methods available in the literature. The dynamic study of our proposed methods which is given in Section V, to cross verify the theoretical aspects.

## II. DEVELOPMENT OF TWO-POINT SIXTH-ORDER METHODS

In this section, we intend to develop several new families of sixth-order super-Halley type methods. For this purpose, we

Ramandeep Behl is with the School of Mathematics, Statistics and Computer Sciences, University of KwaZulu-Natal, Private Bag X01, Scottsville 3209, Pietermaritzburg, South Africa (corresponding author, e-mail: ramanbehl87@yahoo.in).

S. S. Motsa is with the School of Mathematics, Statistics and Computer Sciences, University of KwaZulu-Natal, Private Bag X01, Scottsville 3209, Pietermaritzburg, South Africa.

consider the following well known third-order super-Halley method [1], [2]

$$x_{n+1} = x_n - \frac{f(x_n)}{2f'(x_n)} \left( \frac{2\{f'(x_n)\}^2 - f(x_n)f''(x_n)}{\{f'(x_n)\}^2 - f(x_n)f''(x_n)} \right). \quad (1)$$

Further, we consider  $y_n = x_n - \frac{f(x_n)}{f'(x_n)}$ , a Newton's iterate. With the help of Taylor series, we expand the function  $f(y_n)$  about a point  $x = x_n$  as follows:

$$f''(x_n) \approx \frac{2\{f'(x_n)\}^2 f(y_n)}{\{f'(x_n)\}^2}. \quad (2)$$

Similarly, expanding the function  $f'(y_n) = f'(x_n - \frac{f(x_n)}{f'(x_n)})$  about a point  $x = x_n$  by Taylor series, we have  $f'(y_n) \approx f'(x_n) + f''(x_n)(y_n - x_n)$ , which further yields

$$f''(x_n) \approx \frac{f'(x_n)(f'(x_n) - f'(y_n))}{f'(x_n)}. \quad (3)$$

From (2) and (3), we have

$$f''(x_n) \approx \frac{2\{f'(x_n)\}^2 f(y_n)}{\{f'(x_n)\}^2} + \frac{f'(x_n)(f'(x_n) - f'(y_n))}{f'(x_n)}. \quad (4)$$

Using this approximate value of  $f''(x_n)$  in formula (1) and using the weight function on the second step, we get a modified family of methods free from second-order derivative as follows:

$$\begin{cases} y_n = x_n - \frac{f(x_n)}{f'(x_n)}, \\ x_{n+1} = x_n - \frac{f(x_n)}{2f'(x_n)} \left[ \frac{3f(x_n)f'(x_n) + f(x_n)f'(y_n) - 2f'(x_n)f(y_n)}{f'(y_n)f(x_n) + f(x_n)f'(x_n) - 2f'(x_n)f(y_n)} \right] \end{cases} \quad (5)$$

$\times L_f(u, v)$

where the weight function  $L_f$  is sufficient differential function in a neighborhood of  $(1, 0)$  with  $u = \frac{f'(x_n)}{f'(y_n)} = 1 + O(e_n)$  and  $v = \frac{f(y_n)}{f(x_n)} = O(e_n)$ . Theorem III indicates that under what choices on the weight function which is proposed in (5), the order of convergence will reach at six without using any more functional evaluations.

## III. ORDER OF CONVERGENCE

**Theorem 1:** Let a sufficiently smooth function  $f : D \subseteq \mathbb{R} \rightarrow \mathbb{R}$  has a simple zero  $\xi$  in the open interval  $D$ . Then, the iterative scheme defined by (5) has sixth-order convergence when it satisfies the following conditions

$$\begin{aligned} L_{00} &= 1, L_{01} = \frac{1}{2}, L_{10} = -\frac{1}{4}, L_{02} = -\frac{3}{2}, L_{11} = \frac{1}{2}, L_{20} = \frac{3}{8}, \\ L_{12} &= -\frac{1}{2} - 4L_{21} - 4L_{30}, L_{03} = -9 + 12L_{21} + 16L_{30}, \\ L_{04} &= -8(9 + L_{13} + 3L_{22} + 4L_{31} + 2L_{40}), \end{aligned} \quad (6)$$

where  $L_{ij} = \frac{\partial^{i+j}}{\partial u^i \partial v^j} L_f(u, v)|_{(u=1, v=0)}$ . It satisfies the following error equation

$$e_{n+1} = -\frac{c_2}{12} \left[ 4(9 + 2L_{13} + 24L_{21} + 12L_{22} + 48L_{30} + 24L_{31} + 16L_{40})c_2^4 - 2(L_{13} + 24L_{21} + 6L_{22} + 48L_{30} + 12L_{31} + 8L_{40} - 12)c_2^2 c_3 + 3(3 + 2L_{21} + 4L_{30})c_3^2 - 12c_2 c_4 \right] e_n^6 + O(e_n^7). \quad (7)$$

*Proof:* Let  $\xi$  be a simple zero of  $f(x)$ . With the help of Taylor's series, we get the following expansion of  $f(x_n)$  and  $f'(x_n)$  around  $x = \xi$

$$f(x_n) = f'(\xi) (e_n + c_2 e_n^2 + c_3 e_n^3 + c_4 e_n^4 + e_n^5 c_5 + e_n^6 c_6 + O(e_n^7)), \quad (8)$$

and

$$f'(x_n) = f'(\xi) (1 + 2e_n c_2 + 3e_n^2 c_3 + 4e_n^3 c_4 + 5e_n^4 c_5 + 6e_n^5 c_6 + 7e_n^6 c_7 + O(e_n^7)), \quad (9)$$

respectively. From (8) and (9), we obtain

$$y_n = c_2 e_n^2 - 2(c_2^2 - c_3)e_n^3 + (4c_2^3 - 7c_2 c_3 + 3c_4)e_n^4 + (20c_2^2 c_3 - 8c_2^4 - 6c_3^2 - 10c_2 c_4 + 4c_5)e_n^5 + O(e_n^6). \quad (10)$$

By using (10) and with the help of Taylor series, we get the following expansions of  $f(y_n)$  and  $f'(y_n)$  about  $x = \xi$

$$f(y_n) = f'(\xi) \left( c_2 e_n^2 - 2(c_2^2 - c_3)e_n^3 + (5c_2^3 - 7c_2 c_3 + 3c_4)e_n^4 - 2(6c_2^4 - 12c_2^2 c_3 + 3c_3^2 + 5c_2 c_4 - 2c_5)e_n^5 + O(e_n^6) \right) \quad (11)$$

and

$$f'(y_n) = f'(\xi) \left( 1 + 2c_2^2 e_n^2 - 4(c_2^3 - c_2 c_3)e_n^3 + c_2(8c_2^3 - 11c_2 c_3 + 6c_4)e_n^4 - 4c_2(4c_2^4 - 7c_2^2 c_3 + 5c_2 c_4 - 2c_5)e_n^5 + O(e_n^6) \right) \quad (12)$$

By using (8)-(12), we obtain

$$h = \frac{f'(y_n)}{f'(x_n)} = 1 + 2c_2 e_n + (-2c_2^2 + 3c_3)e_n^2 + (-4c_2 c_3 + 4c_4)e_n^3 + (4c_2^4 - 3c_2^2 c_3 - 6c_2 c_4 + 5c_5)e_n^4 + (22c_2^3 c_3 - 8c_2^5 - 4c_2(3c_3^2 + 2c_5) + 6c_6)e_n^5 + O(e_n^6). \quad (13)$$

and

$$k = \frac{f(y_n)}{f(x_n)} = c_2 e_n + (-3c_2^2 + 2c_3)e_n^2 + (8c_2^3 - 10c_2 c_3 + 3c_4)e_n^3 + (-20c_2^4 + 37c_2^2 c_3 - 8c_3^2 - 14c_2 c_4 + 4c_5)e_n^4 + (48c_2^5 - 118c_2^3 c_3 + 51c_2^2 c_4 - 22c_3 c_4 + c_2(55c_3^2 - 18c_5) + 5c_6)e_n^5 + O(e_n^6). \quad (14)$$

Since it is noteworthy from the above mention equations namely, (13) and (14),  $u = 1 + p$  and  $v = O(e_n)$ . Then, from these equations, we get the remainder  $p = u - 1$  and  $v$  are infinitesimal with the same order of  $e_n$ . Therefore, we can expand weight function  $L_f(u, v)$  in the neighborhood of

(1, 0) by Taylor series expansion up to fourth-order terms as follow

$$L_f(u, v) = L_{00} + L_{10}p + L_{01}v + \frac{1}{2!}(L_{20}p^2 + 2L_{11}pv + L_{02}v^2) + \frac{1}{3!}(L_{30}p^3 + 3L_{21}p^2v + 3L_{12}pv^2 + L_{03}v^3) + \frac{1}{4!}(L_{40}p^4 + 4L_{31}p^3v + 6L_{22}p^2v^2 + 4L_{13}pv^3 + L_{04}v^4) + O(e_n^5). \quad (15)$$

Using (8)-(15), in scheme (5), we get

$$e_{n+1} = (1 - L_{00})e_n - c_2(L_{01} + 2L_{10})e_n^2 + \sum_{l=3}^6 M_l e_n^l, \quad (16)$$

where  $M_l = M_l(c_2, c_3, \dots, c_6)L_{ij}$ , for  $0 \leq i, j \leq 4$ .

We will get at least third-order convergence if we insert the following values of  $L_{00}$  and  $L_{01}$  in (16),

$$L_{00} = 1, \quad L_{01} = -2L_{10}. \quad (17)$$

Further, using (17) into  $M_3 = 0$ , we find two independent relation as follows:

$$(L_{02} + 4(2L_{10} + L_{11} + L_{20})) = 0, \quad (1 + 4L_{10}) = 0 \quad (18)$$

Solving the equations defined in (18) for  $L_{11}$  and  $L_{10}$ , we have

$$L_{11} = -\frac{1}{4}(-2 + L_{02} + 4L_{20}), \quad L_{10} = -\frac{1}{4} \quad (19)$$

By inserting (17) and (19) into  $M_4 = 0$ , we obtain

$$(3 + L_{02} - 4L_{20}) = 0, \quad (1 + L_{02} - \frac{L_{03}}{6} - L_{12} - 4L_{20} - 2L_{21} - \frac{4L_{30}}{3}) = 0. \quad (20)$$

Further, solve the above equation namely, (20) for  $L_{02}$  and  $L_{03}$ , we get

$$L_{02} = 4L_{20} - 3, \quad L_{03} = -(12 + 6L_{12} + 12L_{21} + 8L_{30}). \quad (21)$$

By substituting (17), (19) and (21) into  $M_5 = 0$ , we obtain

$$\begin{cases} (3 - 8L_{20}) = 0, \\ (-5 + 2L_{12} + 16L_{20} + 8L_{21} + 8L_{30}) = 0, \\ [L_{04} + 8(3 + 6L_{12} + L_{13} + 24L_{20} + 24L_{21} + 3L_{22} + 24L_{30} + 4L_{31} + 2L_{40})] = 0. \end{cases} \quad (22)$$

Solving the above equation for  $L_{20}$ ,  $L_{12}$  and  $L_{04}$ , we further yield

$$\begin{cases} L_{20} = \frac{3}{8}, \\ L_{12} = -\frac{1}{2}(1 + 8L_{21} + 8L_{30}), \\ L_{04} = -8(9 + L_{13} + 3L_{22} + 4L_{31} + 2L_{40}). \end{cases} \quad (23)$$

We can easily obtain the following error equation, by using (17), (19), (21) and (23) into (16)

$$e_{n+1} = -\frac{c_2}{12} \left[ 4(9 + 2L_{13} + 24L_{21} + 12L_{22} + 48L_{30} + 24L_{31} + 16L_{40})c_2^4 - 2(L_{13} + 24L_{21} + 6L_{22} + 48L_{30} + 12L_{31} + 8L_{40} - 12)c_2^2 c_3 + 3(3 + 2L_{21} + 4L_{30})c_3^2 - 12c_2 c_4 \right] e_n^6 + O(e_n^7). \quad (24)$$

This reveals that our proposed scheme (5) has sixth-order of convergence while using only four functional evaluations (viz  $f(x_n)$ ,  $f'(x_n)$ ,  $f(y_n)$  and  $f'(y_n)$ ) per full iteration. Hence, this completes the proof of above Theorem III. ■

#### IV. SPECIAL CASES

In this section, we discuss some interesting special cases of weight function  $L_f(u, v)$ , which are defined as follows:

(1) For  $L_{21} = 0$ ,  $L_{30} = 0$ ,  $L_{13} = 0$ ,  $L_{22} = 0$  and  $L_{31} = 0$  in (15), we get the following weight function

$$L_f(u, v) = 1 - \frac{p}{4} + \frac{3p^2}{16} + \frac{L_{40}}{24}p^4 + \frac{4 + 4p + 3p^2}{8}v - \frac{3 + 7p + 3p^2}{4}v^2 - \frac{2L_{40}}{3}v^4, \quad (25)$$

where  $L_{40}$  is a free variable and for the sake of simplicity  $p = u - 1$ . With the help of this disposable parameter, we can easily obtain various different types of weight functions as well as two-point sixth-order methods.

(2) For  $L_{21} = 0$ ,  $L_{40} = 0$ ,  $L_{13} = 0$ ,  $L_{22} = 0$  and  $L_{31} = 0$  in (15), we obtain

$$L_f(u, v) = 1 - \frac{p}{4} + \frac{3p^2}{16} + \frac{L_{30}}{6}p^3 + \frac{p+1}{2}v - \frac{(1+8L_{30})p+3}{4}v^2 + \frac{16L_{30}-9(1+p)}{6}v^3, \quad (26)$$

where  $L_{30}$  is a free variable.

(3) We consider the following weight function, which satisfies all the conditions defined in theorem III

$$L_f(u, v) = \frac{1}{16u^2} \left( 22u^3v - 3u^4v + u(6+8v) - u^2(19v + 12v^2 + 36v^3 - 11) - 1 \right). \quad (27)$$

#### V. NUMERICAL EXPERIMENTS

In this section, we will check the validity and efficiency of theoretical results. Therefore, we apply our methods for ( $L_{40} = 0$  &  $L_{40} = \frac{9}{16}$ ) in scheme (25) and for ( $L_{30} = 0$  &  $L_{30} = \frac{3}{16}$ ) in scheme (26) are denoted by  $OM1$ ,  $OM2$ ,  $OM3$ , and  $OM4$ , respectively, to solve some nonlinear equations given in Table I. We compare them with a three-point sixth-order method proposed by Sharma and Ghua [3], method (3) for ( $a = 2$ ) denoted by ( $SG$ ). In addition, we also compare our schemes with a method namely, method (5) for ( $c=0$ ,  $d=1$ ,  $r=0$ ) called ( $WM$ ) which is given by Wang and Liu in [5]. Finally, we will also compare them with a two-point family of sixth-order methods that is very recently proposed by Guem et al. [11], between them we will choose their best expression (3.8 and 3.12) denoted by ( $KM1$  and  $KM2$ ), respectively. For better comparisons of our proposed methods, we have given three comparison tables in each example: one is corresponding to absolute error in Table II, the second one is with respect to number of iterations in Table III and third one is regarding their computational order of convergence in Table IV respectively. All computations have been performed using the programming package *Mathematica 9* with multiple precision arithmetic. The meaning of  $a(-b)$  is  $a \times 10^{-b}$  in Table II. We use  $\epsilon = 10^{-34}$  as a tolerance error. The following stopping criteria are used for computer programs:

$$(i) |x_{n+1} - x_n| < \epsilon \text{ and } (ii) |f(x_{n+1})| < \epsilon.$$

#### VI. ATTRACTOR BASINS IN THE COMPLEX PLANE

Here, we further investigate the comparison of the attained simple root finders in the complex plane using basins of attraction. It is known that the corresponding fractal of an iterative root-finding method is a boundary set in the complex plane, which is characterized by the iterative method applied to a fixed polynomial  $p(z) \in \mathbb{C}$ , see e.g. [12], [13]. The aim herein is to use basin of attraction as another way for comparing the iteration algorithms.

From the dynamical point of view, we consider a rectangle  $D = [-3, 3] \times [-3, 3] \in \mathbb{C}$  with a  $400 \times 400$  grid, and we assign a color to each point  $z_0 \in D$  according to the simple root at which the corresponding iterative method starting from  $z_0$  converges, and we mark the point as black if the method does not converge. In this section, we consider the stopping criterion for convergence to be less than  $10^{-4}$  wherein the maximum number of full cycles for each method is considered to be 200. In this way, we distinguish the attraction basins by their colors for different methods.

**Test problem 1.** Let  $p_1(z) = (z^4 + 1)$ , having simple zeros  $\{-0.707107 - 0.707107i, -0.707107 + 0.707107i, 0.707107 - 0.707107i, 0.707107 + 0.707107i\}$ . It is straight forward to see from Figs. 1 and 2 that our methods namely,  $OM1$  and  $OM3$  contain lesser number of non convergent points in comparison to the methods, namely  $SG$ ,  $WM$ ,  $KM1$  and  $KM2$ . Further our methods they have larger and brighter basin of attraction in comparison to the mentioned methods.

**Test Problem 2.** Let  $p_2(z) = (z^3 + z + 1)$ , having simple zeros  $\{-0.682328, 0.341164 - 1.16154i, 0.341164 + 1.16154i\}$ . We can easily note from Figs. 3 and 4 that our proposed methods namely,  $OM1$  and  $OM3$  have less number of non convergent points and have larger and brighter basin of attraction in comparison to methods  $WM$ ,  $KM1$ .

#### VII. CONCLUSIONS

In this paper, we contributed further to the development of the theory of iteration processes and proposed several second-derivative free two-point sixth-order family of super-Halley type methods based on weight function and arithmetic means of second-order derivative. By assigning particular values to the disposable parameters namely, ( $L_{40}$ ) and ( $L_{30}$ ) in schemes (25) and (26), respectively, we can obtain several new weight functions as well as new two-point sixth-order methods. By considering different type of weight functions, we further yield so many new two-point sixth-order methods. Finally, on accounts of the results obtained, it can be concluded that our proposed methods are highly efficient as compared to the existing methods. From their basins of attraction, it has been observed that the proposed methods have better stability and robustness as compared to the other sixth-order methods available in the literature.

TABLE IV  
COMPUTATIONAL ORDER OF CONVERGENCE OF DIFFERENT SIXTH-ORDER METHODS

$f(x)$	I.G.	SG	WM	KM1	KM2	OM1	OM2	OM3	OM4
1.	-2	6.000	5.997	5.997	5.996	6.000	6.000	6.000	6.000
	-1.6	5.999	6.000	5.989	5.988	5.999	6.000	5.996	6.000
2.	2.5	6.000	6.000	6.000	6.000	6.000	6.000	6.000	6.000
	4.0	5.990	5.931	5.958	5.995	6.001	6.003	5.999	6.001
3.	34	6.000	6.000	6.000	6.000	6.000	6.000	6.000	6.000
	39	6.000	6.000	6.000	6.000	6.000	6.000	6.000	6.000
4.	1.5	6.000	6.000	6.000	6.000	6.000	6.000	6.000	6.000
	1.6	6.000	6.000	6.000	6.000	6.000	6.000	6.000	6.000
5.	0.85	6.000	5.999	5.999	5.999	6.000	6.000	6.000	6.000
	1.6	6.000	6.003	6.000	5.993	6.000	6.000	6.000	6.000
6.	1.0	5.989	5.993	5.996	6.001	6.019	6.061	6.010	6.052
	1.2	5.988	5.984	5.988	5.990	5.999	5.999	6.001	6.000
	2.25	5.997	6.000	6.000	6.000	5.999	6.008	5.999	6.007

Fig. 1 The methods *SG*, *WM*, *KM1* and *KM2*, respectively for test problem 1

Fig. 2 Our methods *OM1*, *OM2*, *OM3* and *OM4*, respectively for test problem 1

Fig. 3 The methods *SG*, *WM*, *KM1* and *KM2*, respectively for test problem 2

Fig. 4 Our methods *OM1*, *OM2*, *OM3* and *OM4*, respectively for test problem 2
