The evolution of bacterial cell differentiation and multicellular organization

Jordi van Gestel

The evolution of bacterial cell differentiation and multicellular organization

The research reported in this thesis was carried out at the Theoretical Research in Evolutionary Life Sciences group (TRÊS), which is part of the Groningen Institute for Evolutionary Life Sciences (GELIFES) of the University of Groningen (The Netherlands), according to the requirements of the Graduate School of Sciences (Faculty of Mathematics and Natural Sciences, University of Groningen). Part of the research was also carried out at Molecular Genetics group (MolGen), which is part of the Groningen Biomolecular Sciences and Biotechnology Institute (GBB) of the University of Groningen (The Netherlands); the Kolter lab, which is part of Microbiology and Immunobiology department of Harvard Medical School (USA); and the Program for Evolutionary Dynamics (PED), which is part of the Organismic and Evolutionary Biology department and the Mathematics department of Harvard University (USA).

Jordi van Gestel received a PhD grant from the Graduate Programme of the Dutch Science Foundation (NWO). The research was furthermore supported by the Ubbo Emmius Fund and Gratama Foundation. The printing of this thesis was partly funded by the University of Groningen and the Faculty of Mathematics and Natural Sciences (University of Groningen).

The evolution of bacterial cell differentiation and multicellular organization

PhD thesis

to obtain the degree of PhD at the
 University of Groningen
 on the authority of the
 Rector Magnificus Prof. E. Sterken
 and in accordance with
 the decision by the College of Deans.

This thesis will be defended in public on

Friday 1 April 2016 at 16:15 hours

by

Jordi van Gestel

born on 4 November 1987
 in Gilze en Rijen

Supervisor

Prof. F. J. Weissing

Assessment committee

Prof. J. D. van Elsas

Prof. J. A. G. M. de Visser

Prof. B. Kerr

Contents

<i>Chapter 1</i>	7
Introduction: From so simple a beginning	
<hr/>	
PART I: Bacterial cell differentiation and multicellular organization	
<i>Chapter 2</i>	29
The division of labor in biofilms: the ecology of cell differentiation	
<i>Chapter 3</i>	57
Density of founder cells affects spatial pattern formation and cooperation in <i>Bacillus subtilis</i> biofilms	
<i>Chapter 4</i>	87
From cell differentiation to cell collectives: How <i>Bacillus subtilis</i> divides labor to migrate	
<i>Chapter 5</i>	135
Comparing microscopy images: a quantitative analysis of surfactin-producing and matrix-producing cells in <i>Bacillus subtilis</i> colonies	
<i>Chapter 6</i>	171
Bet-hedging during bacterial diauxic shift	
<hr/>	
PART II: The evolution of cell differentiation	
<i>Chapter 7</i>	207
Phenotypic heterogeneity and the evolution of bacterial life cycles	
<i>Chapter 8</i>	245
The evolution of cell-to-cell communication in a sporulating bacterium	
<i>Chapter 9</i>	281
Regulatory mechanisms link phenotypic plasticity to evolvability	
<i>Brief communication</i>	319
Plasticity: not by single genes alone	
<hr/>	
<i>Chapter 10</i>	325
Epilogue: Evolution, cycles and signals
