### **SHORTEST SUMMARY**

- RITA is a **robot** to **assist** the **elderly** in daily activities
- We developed and evaluated an interface for RITA
  - to remind elderly about medication intake
  - on a touch screen
  - The main findings were:
  - users understood the interface
  - users were able to take medication with the touch screen support
  - many were unable to perform slightly more advanced functions
- The main conclusions / recommendations were:
  - interfaces should be as **simple** as possible
  - usability tests should be routine in developing health technology for the elderly

### **AIM OF THE STUDY**

- To develop a **robot interface** to assist the elderly with their medication intake.
- To investigate whether the target group is willing to accept medication intake assistance from a robot

#### MEDICATION INTAKE INTERFACE

#### **Usability test**

- The majority of participants in this study (17 out of 19) were able to take their medication with assistance of the interface
- Participants found it difficult to work with more advanced interface settings

MAIN RESULTS OF USER STUDY

- setting notifications interval
- changing pharmacy's contact details
- Post-Study **Usability** Questionnaire (Likert 5-point scale)
  - Users rated usability **positively** 
    - mean score of 3.9 (between 'Neutral' and 'Agree')

#### **Robot Acceptance**

**CONCLUSIONS &** 

- Robot Acceptance Questionnaire (Likert 5-point scale)
  - User accepted help from the robot
    - mean score of 3.5 ('Neutral')

## **BACKGROUND**

**DESIGN PROCESS** 

Interviews with caregivers

Focus group of elderly

Interface development

requirements analysis

Main result:

Main result:

User study

screen

- **Medication intake** can prove to be a complicated task for the elderly.
- Roughly 50% of all prescribed medication is taken incorrectly (MacLaughlin, et al., 2005)
- Simplification of this task might have beneficial effects on this group's general health and society's healthcare costs
- Together with Enacer Company we developed an assistive robot for the elderly, called RITA (the Reliable Interactive Table Assistant).

• it is especially **important** to **check** whether the

Font size should be increased for optimal utility

**Usability test** of the the interface on the touch

tasks related to the intake of medication

subjects were asked to perform a number of

basic task: supervision of medication intake

more advanced functions: change settings

elderly actually take their medication

feedback on the **clarity** of the design

The interface was developed in HTML5

Acceptance questionnaire

# Medicatie inname n beeld te blijven. De opname

# Instellingen

- accompanies people in their own home
- assists in activities of daily living
- RITA continuously **monitors** the client
- RITA analyses behavioral patterns to
  - **detect** uncommon situations
  - alarms health care personnel to check the situation
- RITA functions autonomously
- clients have no need to give direct orders to RITA:
- it does not have a futuristic look but is instead a wooden table
  - market research has shown that older people appreciate the classic
- RITA supports health care professionals to make sure they are able to provide

# RECOMMENDATIONS **Conclusion**

- The basic functionality of the **interface** was **easy to** use for the elderly for assistance with the medication intake task
- Elderly are willing to accept assistance of a robot with this task

#### Recommendations

- Interfaces for the elderly should really be as simple as possible
- Testing of usability aspects during the design process is **vital** for a well-designed robot

## THE ROBOT RITA

- RITA is an **intelligent**, moving wooden **table**

- RITA can serve food and drinks to clients and visitors
- RITA will already know what to do
- RITA can be operated directly by using the **touch screen** on the front of the
- RITA was designed to blend in with existing furniture and not to stand out
  - look
- their clients with maximum comfort and quality of life relieving them of certain repetitive tasks and aiding them in more complex tasks
