IMAGING AND MODULATION OF NEURAL
NETWORKS UNDERLYING KEY SYMPTOMS
OF SCHIZOPHRENIA

LEONIE BAIS

About the cover

In this contemporary Rorschach-style inkblot, one could perceive two connected faces, representing the human aspect of this thesis, as well as the exciting links that are made between several groups of patients. The blot is made out of different colors of ink, resembling the brain networks that have been investigated in this thesis. In addition, the blot has the shape of a butterfly. This is a reference to the 'butterfly' TMS coil that is used to excite links in the brains of patients that participated in the treatment studies. But of course, such blots are subject to interpretation. What do *you* perceive?
