## Introduction

## 1 Introduction

### 1.1 General introduction

Natural products play a key role in modern drug development. According to a recent survey, up to $40 \%$ of al current trade drugs are natural products, or compounds derived or otherwise inspired by them. ${ }^{1-6}$ Considering the fact that these compounds constitute less than $1 \%$ of all screened compounds, it is clear that their success rate in terms of the probability to find activity is much higher than for fully synthetic compounds. This is hardly surprising, since natural products are in essence already optimized structures being the result of millions of years of evolution. The fact that many biologically active natural products with a certain native target also bind to human proteins can be rationalized by the occurence of a limited number of protein folding types in nature. ${ }^{7,8}$ These are conserved amino acid sequences in proteins that fold in a particular manner, quite independent of the rest of the protein. Through recombination and mutation of folding sequences, new proteins evolve. This theory provides a strong argument not only for natural products research, but for synthesis of derivatives and analogues of natural products as well.

Another argument for natural products as starting points for drug development is the observation that they commonly fit Lipinski's rule of five, ${ }^{9 *}$ an important tool to estimate bioavailability on the basis of structure, equally well as current trade drugs. ${ }^{10}$

[^0]Synthetic drugs are often rich in five- and six-membered nitrogen-containing aromatic heterocycles and therefore relatively rigid. These substructures are much less common in natural products, which are often more or less flexible structures in dynamic equilibria. Some of nature's strategies to limit conformational freedom in principally linear compounds like polyketides are e.g. formation of medium and large rings (macrocycles) ${ }^{11}$ or formation of tetrahydropyran (THP) and -furan rings. In some cases, the stereochemistry of methyl substituents on a linear polyketide chain may govern the overall conformation of the molecule through 1,3 -allylic strain or syn-pentane interactions. ${ }^{12}$ All of the above structural elements impose a preferred conformation on the molecule, but still leave it quite flexible. This is in accordance with the currently accepted "hand-and-glove" model for receptor-substrate binding rather than the earlier "key-and-lock" model. ${ }^{13}$

3b: Phorboxazole B: $R^{1}=H, R^{2}=O H$

Figure 1.1. THP-containing biologically active natural products.

Tetrahydropyran (THP) rings are common structural motifs in biologically active natural products, ${ }^{14}$ including laulimalide (1), bryostatins I (2a) and II (2b), phorboxazoles A (3a)
and B (3b), and ambruticin (4, see Fig. 1.1). Such compounds are mainly of polyketide origin and the THP rings result from cyclization through two oxygen functionalities in a 1,5-relationship.

### 1.2 Ratjadone and the leptomycin family

A THP-containing polyketide natural product with exceptionally high biological activity is ratjadone (5, Fig. 1.2). It was isolated from the myxobacterium Sorangium cellulosum present in a soil sample collected in Cala Ratjada (Mallorca, Spain) by Höfle and Reichenbach and co-workers in 1995. ${ }^{15,16}$ It was originally selected for its modest antifungal activity against Mucor hiemalis, Phytophthora drechsleri, Ceratocystis ulmi, and Monilia brunnea, but was soon shown to possess very strong cytotoxic properties, with $\mathrm{IC}_{50}$ values in the picomolar range for a variety of mammalian cell lines. ${ }^{15,16}$

Figure 1.2. Ratjadone.

Ratjadone is a member of a group of structurally similar compounds generally referred to as the leptomycin family, after its most prominent representative, leptomycin B (6). Other members include callystatin $\mathrm{A},{ }^{17,18}$ the kasuza- and anguinomycins, leptolstatin, ${ }^{19}$ and the leptofuranins ${ }^{20,21}$ (Fig. 1.3). Recently, Höfle and co-workers isolated several other ratjadones from another strain of Sorangium cellulosum and named these ratjadones B-D (Fig. 1.3), while renaming the original ratjadone to ratjadone $\mathrm{A} .^{22}$ For the sake of simplicity, ratjadone A will be referred to in this thesis as ratjadone.

### 1.2.1 Inhibition of nuclear export of proteins

Leptomycin B (LMB, 6) was demonstrated to inhibit the function of the crm1 gene, which was shown to be required for maintaining correct chromosome structure in the fission yeast Schizosaccharomyces pombe. ${ }^{23}$ Later, the corresponding CRM1 protein was found to have a much broader function, namely nuclear export of proteins, many of which are essential for cell growth. As a result, the cell cycle is arrested in the G1 phase upon exposure to LMB (6). There are two main routes for the export of proteins from the cell nucleus to the cytosol. The first involves proteins carrying nuclear localization sequences (NLS), rich in basic amino acids, and this route is responsible for a major part of subcellular distribution of proteins. The second route concerns proteins carrying nuclear export sequences (NES) rich in leucine. CRM1/exportin 1 was shown to be a receptor for NES in both higher and lower eukaryotes.

Nuclear export of NES-carrying proteins by CRM1 is regulated by the GTPase Ran (see Fig. 1.4), which exists primarily in the GTP-bound state in the nucleus due to the high GTP/GDP ratio and the action of the nucleotide exchange factor RCC1. ${ }^{24}$ CRM1, RanGTP
and a NES-carrying cargo protein associate to form a complex, which is transported from the nucleus to the cytoplasm through the nuclear pore complex (NPC). There, the complex is rapidly dissociated by the action of RanBP1 and RanBP2. ${ }^{25}$ In addition, the cytoplasmic protein RanGAP stimulates the GTPase activity of Ran and thus converts it to its GDPbound state, preventing reassociation of the complex. ${ }^{26}$ The cargo protein is released into the cytoplasm and CRM1 and RanGDP are shuttled back to the nucleus.

Figure 1.4. RanGTP-dependent nuclear export of proteins by CRM1.

It has been suggested that leptomycin B inhibits the CRM1 protein of S. pombe by covalent bonding through Michael addition of Cys529 to the $\alpha, \beta$-unsaturated lactone moiety. ${ }^{27}$ Cys529 lies in the "central conserved region", which is thought to be involved in NES binding. ${ }^{28}$ This hypothesis is supported by the fact that Saccharomyces cerevisiae (whose wild-type CRM1 protein contains a serine residue instead of cysteine), and a Cys529Ser mutant of S. pombe, are insensitive to leptomycin B. Serine residue hydroxyl groups typically do not react with $\alpha, \beta$-unsaturated carbonyl compounds under physiological conditions. Indirect evidence was supplied by the strongly decreased activity of a leptomycin B derivative that is a nitromethane Michael adduct of the natural product and therefore not a Michael acceptor anymore. ${ }^{27}$ Also, a synthetic octadecapeptide representing amino acid residues 513-530 of human CRM1 was shown to form an adduct with LMB by
mass spectrometry. A similar octadecapeptide, in which only the Cys residue was substituted by a Ser residue, did not display such adduct formation in the mass spectrometric analysis. ${ }^{27}$ Recently, ratjadone and some of its minor natural derivatives were also shown to inhibit nuclear export, and covalent binding to S. pombe CRM1 protein through Michael addition was proven. ${ }^{22}$
Thus, the extremely high activity of the members of the leptomycin family can be related to covalent binding of the CRM1 cysteine residue to the $\alpha, \beta$-unsaturated lactone in a Michaeltype addition. Interestingly, LMB does not react with cysteine-containing compounds such as L-cysteine or glutathione under physiological conditions. ${ }^{27}$ Therefore, Kudo et al. propose that the molecule initially binds to the CRM1 protein in a non-covalent manner, thereby facilitating Michael addition of the cysteine residue thiol group to the $\alpha, \beta$ unsaturated lactone by proximity effects. ${ }^{27}$

Because of this dramatic and selective activity, leptomycin $B$ (which is available by fermentation) has become an important tool in cell biology, and possible therapeutic applications of these compounds have also been suggested. ${ }^{29}$ A possible basis for such an application is the effect of CRM1 on the activity of the p53 tumor suppressor protein. The p53 protein marks an important checkpoint in the cell cycle, as it screens the DNA for aberrations and abnormal proliferation. ${ }^{29}$ Detection of such an abnormality leads to a cascade of cellular events and eventually to apoptosis. Inactivation of p53 is an important criterium for the development of cancer. Indeed, in more than half of all human tumors, the P53 gene is mutated. In the majority of cancers in which the P53 gene is not mutated, p53 activity is compromised in a different manner, such as downregulation of transcription or translation, or through excessive export of p53 from the cell nucleus, where the majority of cellular events concerning the cell cycle take place, to the cytosol. ${ }^{29}$ In addition, degradation of p53 takes place in the cytoplasm, e.g. under the influence of the MDM2 oncoprotein or the HPV (human papilloma virus, an oncovirus) E6 protein. ${ }^{30}$ Since the p53 protein carries an NES sequence, ${ }^{31}$ regulation of CRM1 would be expected to influence the activity of p53 in the cell nucleus. Indeed, it has been demonstrated that p53 activity in the cell nucleus increases considerably upon treatment with leptomycin B. ${ }^{30}$ Accumulation of p53 in the nucleus frequently results in apoptosis rather than growth arrest in cancer cells, especially in comparison with many other tissues. ${ }^{29}$ It has been suggested that non-
genotoxic activation of p 53 (such as that caused by treatment with leptomycin family members) may be particularly effective, whilst avoiding typical side effects caused by current cancer therapeutics. ${ }^{29}$

The obvious drawback to pharmaceutical application of compounds of the leptomycin family is their inherent cytotoxicity. A wide variety of other essential cellular processes are also compromised as a consequence of inhibition of CRM1. Therapeutic effects may, however, occur at subtoxic concentrations. Additionally, there may be a selectivity towards cancer cells. However, preliminary clinical trials with leptomycin B were halted due to secondary effects and problems with pharmacokinetic studies. ${ }^{29}$ Nevertheless, the use of these compounds has been suggested for topical application for the treatment of tumors. ${ }^{29}$ Other protein substrates for CRM1 that are of clinical interest include the HIV-1 Rev protein ${ }^{32}$ and the influenza ribonucleoprotein complex, ${ }^{33}$ as well as other viral proteins. ${ }^{34}$

### 1.2.2 Williams' synthesis of (-)-ratjadone

Ratjadone has been the object of several total synthesis efforts, which will be discussed in the coming sections. In 2001, Williams et al. reported the total synthesis of the unnatural isomer (-)-ratjadone (5a). ${ }^{35}$ The synthesis strategy involves an aldol-based reacion sequence to THP fragment 12, followed by connection to linear C3-C14 fragment 13 and subsequent elaboration to (-)-ratjadone 5a.

Figure 1.5. Retrosynthesis of Williams' total synthesis of (-)-ratjadone 5a.

The forward synthesis commenced with conversion of known Evans' aldol product 14 to aldehyde 15 by TBDPS protection, reductive cleavage of the chiral auxiliary and subsequent Swern oxidation (Scheme 1.1). Brown asymmetric allylation using $B$-allyldiisocampheyl-borane followed by PMB protection then furnished 16. The terminal olefin was converted to an aldehyde by selective Sharpless dihydroxylation and subsequent in situ vicinal diol cleavage. Wittig reaction followed by DIBAL-H reduction afforded an allylic alcohol, which was was subjected to Sharpless asymmetric epoxidation to give epoxide 17. After protection of the primary alcohol as a pivaloate, TBDPS cleavage followed by treatment with acid triggered intramolecular epoxide opening to give 18. Cleavage of the PMB protective group was then followed by double TBS protection. Reductive cleavage of the pivaloate followed by Dess-Martin oxidation ${ }^{36}$ finally furnished THP building block 12.

Scheme 1.1. (a) TBDPSCl, imidazole, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; (b) $\mathrm{LiBH}_{4}, \mathrm{Et}_{2} \mathrm{O}, \mathrm{H}_{2} \mathrm{O}, 84 \%$ over two steps; (c) $(\mathrm{COCl})_{2}$, DMSO, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 98 \%$; (d) $B$-allyldiisocampheylborane, $\mathrm{Et}_{2} \mathrm{O},-78^{\circ} \mathrm{C}, 91 \%$; (e) PMB trichloroacetimidate, $\mathrm{CSA}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 67 \%$; (f) AD-mix $\alpha, t \mathrm{BuOH}, \mathrm{H}_{2} \mathrm{O}$, then $\mathrm{NaIO}_{4}$, aq. THF, quant.; (g) $\mathrm{MeOC}(\mathrm{O}) \mathrm{CH}=\mathrm{PPh}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 88 \%$; (h) DIBAL-H, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}, 96 \%$; (i) (+)-DET, Ti(OiPr) $)_{4}, 4 \AA$ sieves, $t \mathrm{BuOOH}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 98 \%$; (j) PivCl, py, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 95 \%$; (k) TBAF, THF, $40^{\circ} \mathrm{C}, 82 \%$; (l) CSA, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 90 \%$; (m) CAN, $\mathrm{CH}_{3} \mathrm{CN}, \mathrm{H}_{2} \mathrm{O}$, quant.; (n) TBSCl, imidazole, DMAP, DMF, $91 \%$; (o) DIBAL- $\mathrm{H}^{2} \mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}$, $99 \%$; (p) DMP, $\mathrm{NaHCO}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 93 \%$.

Synthesis of linear fragment 13 started with alkylation of known Evans' amide $\mathbf{1 9}^{37}$ to give 20 in a 11:1 mixture of isomers favoring the desired 2 'S isomer. Reductive cleavage of the auxiliary followed by Swern oxidation ${ }^{38}$ afforded 21. Still-Gennari reaction ${ }^{39}$ and subsequent DIBAL-H reduction then furnished allylic alcohol 23, which was subject to Swern oxidation, ${ }^{38}$ giving an aldehyde that was converted to alkyne 24 using the Corey-

Fuchs ${ }^{40}$ procedure. Wipf hydrozirconation followed by transmetallation to the organozinc reagent ${ }^{41}$ and subsequent reaction with 3-phenylthiopropionaldehyde produced 25 as a mixture of diastereomers. After Dess-Martin oxidation ${ }^{36}$, a Terashima reduction ${ }^{42,43}$ introduced the desired $S$-configuration in 25 ( $5: 1$ mixture of diastereomers). Then, the thioether was converted to the sulfone and the free alcohol was protected as a pivaloate. Cleavage of the TBDPS ether and conversion of the resulting alcohol to the corresponding bromide then completed the synthesis of linear fragment 13.

Scheme 1.2. (a) NaHMDS, THF, $-78^{\circ} \mathrm{C}$, then MeI, $81 \%$, ( $2^{\prime} \mathrm{S}: 2^{\prime} R=11: 1$ ); (b) $\mathrm{LiBH}_{4}, \mathrm{MeOH}, \mathrm{Et}_{2} \mathrm{O}, 87 \%$; (c) $(\mathrm{COCl})_{2}$, DMSO, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 94 \%$; (d) $\left(\mathrm{CF}_{3} \mathrm{CH}_{2} \mathrm{O}\right)_{2} \mathrm{P}(\mathrm{O}) \mathrm{CHMeCO}_{2} \mathrm{Et}, \mathrm{KHMDS}, 18$-crown-6, THF, $99 \%$; (e) DIBAL-H, $\mathrm{Et}_{2} \mathrm{O},-78^{\circ} \mathrm{C}, 98 \%$ (f) (COCl) $)_{2}$, DMSO, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; (g) $\mathrm{CBr}_{4}, \mathrm{PPh}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; (h) $n$ BuLi, THF, $-78^{\circ} \mathrm{C}, 85 \%$ over three steps; (i) $\mathrm{Cp}_{2} \mathrm{Zr}(\mathrm{H}) \mathrm{Cl}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 23^{\circ} \mathrm{C}$, then $\mathrm{Me}_{2} \mathrm{Zn},-65^{\circ} \mathrm{C}$, then 3-phenylthiopropionaldehyde, $-65 \rightarrow 0^{\circ} \mathrm{C}, 92 \%$; (j) DMP, $\mathrm{NaHCO}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 84 \%$; (k) $\mathrm{LiAlH}_{4}$ (2.0 eq.), (-)-$N$-Me-ephedrine ( 2.0 eq.), $N$-ethylaniline ( 4.0 eq.), $\mathrm{Et}_{2} \mathrm{O},-78^{\circ} \mathrm{C}, 98 \%$; (1) $\left(\mathrm{NH}_{4}\right)_{6} \mathrm{Mo}_{7} \mathrm{O}_{24}, \mathrm{H}_{2} \mathrm{O}_{2}$, aq. EtOH , $0^{\circ} \mathrm{C}, 90 \%$; (m) PivCl, py, DMAP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, quant.; (n) TBAF, THF, quant.; (o) MsCl, collidine, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, then $\mathrm{LiBr}, \mathrm{THF}, 82 \%$.

The two main fragments 12 and 13 were now coupled by conversion of bromide 13 to the corresponding tributylphosphonium salt and Wittig reaction with 12. Exchange of the pivaloate protective group for TES was followed by $\alpha$-deprotonation of the sulfone and
subsequent reaction with ethylene oxide, installing the final two atoms of the (-)-ratjadone carbon skeleton. After Dess-Martin oxidation ${ }^{36}$ of the primary alcohol, acidic cleavage of the TES ether afforded a lactol, which was then oxidized to the corresponding lactone. Basic elimination of the sulfone and cleavage of the TBS protective groups under mild conditions finally afforded (-)-ratjadone $\mathbf{5 a}$.

Scheme 1.3. (a) $\mathrm{PBu}_{3}$, then 12, toluene, then $\mathrm{KOtBu} / \mathrm{THF}, 0^{\circ} \mathrm{C}, 72 \%$; (b) DIBAL-H, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}, 89 \%$; (c) TESCl, py, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 94 \%$; (d) $n \mathrm{BuLi}$, THF, HMPA, then ethylene oxide, $78 \%$; (e) DMP, $\mathrm{NaHCO}_{3}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; (f) PPTS, EtOH, $0^{\circ} \mathrm{C}$; (g) TPAP, NMO, $4 \AA$ sieves, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 86 \%$ over three steps; (h) DBU, toluene, $87 \%$; (i) HF•py, py, THF, $76 \%$.

### 1.2.3 Kalesse' synthesis of (+)-ratjadone

Shortly before Williams published his synthesis, Kalesse and co-workers reported their total synthesis of the natural isomer (+)-ratjadone (5). Kalesse used a much more elegant and convergent strategy (see retrosynthesis in Fig. 1.6) that employs a Heck coupling and a Wittig reaction to connect A (THP ring, 28), B (chain, 29), and C (lactone, 30) fragments. ${ }^{44,45}$ THP fragment 28 was constructed in a fashion similar to Williams' synthesis, but more efficiently. The synthesis of aldehyde 31 was achieved in analogy to the corresponding enantiomeric, PMB-protected aldehyde in the Williams' synthesis. A vinyloguous Mukaiyama aldol reaction ${ }^{46}$ then afforded ester 32 in a single step, whereas a multistep procedure was required for the comparable transformation in the Williams'synthesis.

Figure 1.6. Retrosynthetic analysis of Kalesse's total synthesis of (+)-ratjadone

A more efficient and simpler protective group strategy in the following transformation reduces the number of steps in comparison with the Williams' synthesis. Construction of aldehyde ent-12 from Evans' aldol ent-14 required only 11 reaction steps in the Kalesse synthesis, compared to 17 steps for the enantiomeric species in the Williams' synthesis (Scheme 1.4).

Scheme 1.4. (a) $\mathrm{MeONHMe} \cdot \mathrm{HCl}, \mathrm{AlMe}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-20 \rightarrow 25^{\circ} \mathrm{C}$; (b) TBSOTf, 2,6-lutidine, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}$ (c) DIBAL-H, THF, $-78^{\circ} \mathrm{C}, 83 \%$ over three steps; (d) $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{Et}_{2} \mathrm{O} 9: 1,-78^{\circ} \mathrm{C}, \mathrm{dr}>19: 1,80 \%$; (e) DIBAL-H, THF, $-78^{\circ} \mathrm{C}$; (f) $\mathrm{mCPBA}, \mathrm{NaHCO}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}, 85 \%$ over two steps; (g) (i) TBAF, THF, $88 \%$; (ii) amberlyst-15, THF, $93 \%$; (h) TBSOTf, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}, 87 \%$; (i) $\mathrm{HCl}, \mathrm{CHCl}_{3}, 97 \%$; (j) DMP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, $0^{\circ} \mathrm{C}, 92 \%$; (k) Tebbe reagent, THF, $0^{\circ} \mathrm{C}$, $95 \%$; (1) TBAF, THF, quant.

Treatment of aldehyde ent-12 with Tebbe reagent furnished the required alkene 37, and its unprotected form 28 was available by standard desilylation.
The B fragment 29 was constructed in a relatively short sequence from known alkyne 38, which is available in five steps from commercial Roche ester [methyl (S)-3-hydroxy-2-methyl-propionate]. ${ }^{47}$ Carbometallation using the $\mathrm{Cp}_{2} \mathrm{ZrCl}_{2} / \mathrm{AlMe}_{3}$ combination according to the Negishi protocol afforded vinylic iodide 39. Dess-Martin oxidation and subsequent Still-Gennari reaction provided ester 40, and DIBAL-H reduction followed by a two-step conversion of the resulting alcohol 41 to the corresponding tributylphosphonium bromide furnished B fragment 29. The strength of this part of the synthesis is that protective groups are not required.

Scheme 1.5. (a) $\mathrm{Cp}_{2} \mathrm{ZrCl}_{2}, \mathrm{AlMe}_{3}, \mathrm{I}_{2}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, THF, $-15 \rightarrow 25^{\circ} \mathrm{C}, 83 \%$; (b) DMP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}, 81 \%$; (c) $\left(\mathrm{CF}_{3} \mathrm{CH}_{2} \mathrm{O}\right)_{2} \mathrm{P}(\mathrm{O}) \mathrm{CHMeCO}_{2} \mathrm{Et}$, KHMDS, 18-crown-6, THF, $-78^{\circ} \mathrm{C}, 85 \%$; (d) DIBAL-H, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}$, $77 \%$; (e) $\mathrm{CBr}_{4}, \mathrm{PPh}_{3}, \mathrm{CH}_{3} \mathrm{CN}$; (f) $\mathrm{PBu}_{3}, \mathrm{CH}_{3} \mathrm{CN}, 87 \%$ over two steps.

The carbon skeleton of the C fragment 30 was constructed in a single step by a $\mathrm{Ti}(\mathrm{OiPr})_{4}-$ catalyzed hetero Diels-Alder reaction between 1-methoxy-1,3-butadiene and ethyl glyoxylate. ${ }^{48}$ The ester function of $\mathbf{4 3}$ was then reduced and the equatorial methyl acetal was converted to the more stable axial isopropyl acetal 44. Subsequent Swern oxidation afforded the required aldehyde $\mathbf{3 0}$.

Scheme 1.6. (a) $\mathrm{Ti}\left(\mathrm{OiPr}_{4},(+)-\mathrm{BINOL}, 4 \AA\right.$ mol. sieves, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 65 \%$; (b) $\mathrm{LiAlH}_{4}, \mathrm{Et}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}$; (c) PPTS, $i \operatorname{PrOH} ;(\mathrm{d})(\mathrm{COCl})_{2}, \mathrm{DMSO}^{2} \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 77 \%$ over three steps.

The B and C fragments were efficiently connected by a Wittig reaction to give 45. Heck reaction (which was shown to be the most efficient palladium-catalyzed cross-coupling reaction in preliminary studies) of $\mathbf{4 5}$ with alkene 37 afforded the desired coupling product 27 in $45 \%$ yield. However, when unprotected alkene 28 was used, the coupling reaction proceeded in $80 \%$ yield. Subsequent reprotection of the two free hydroxyl groups furnished 27. After hydrolysis of the isopropyl acetal and oxidation of 48 to the lactone, the synthesis of (+)-ratjadone $\mathbf{5}$ was completed by mild hydrolysis of the TBS ethers.

Scheme 1.7. (a) KOtBu , toluene, $0^{\circ} \mathrm{C}, 76 \%$; (b) $\mathrm{Pd}(\mathrm{OAc})_{2}, \mathrm{Bu}_{4} \mathrm{NBr}, \mathrm{Cs}_{2} \mathrm{CO}_{3}, \mathrm{Et}_{3} \mathrm{~N}$, $\mathrm{DMF}, 80 \%$ with 28, $45 \%$ with 37; (c) PPTS, $\mathrm{H}_{2} \mathrm{O}$ /acetone, $83 \%$; (d) TBSOTf, 2,6-lutidine, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}, 83 \%$; (e) $\mathrm{MnO}_{2}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{py}, 77 \%$; (f) HF•py, THF, py, $76 \%$.

In conclusion, Kalesse's total synthesis of (+)-ratjadone features the efficient asymmetric synthesis of three fragments that are connected by two efficient coupling reactions. The specific planning of the synthesis limits the requirement for protective groups. This in turn reduces the number of steps and increases efficiency.

### 1.2.4 SAR studies of ratjadone

In a later study, Kalesse et al. published limited SAR data based on the biological evaluation of a small library of synthetic ratjadone analogues. ${ }^{49}$ These compounds were mainly diastereomers, which were derived from connection of both enantiomers of
fragments 28, 29, and 30 in analogy to the total synthesis described above. The structures and activities of the tested compounds are shown in Table 1.1.

Table 1.1: Growth inhibition and $\mathrm{LC}_{50}$ values for compounds 5 and $\mathbf{5 0 - 5 4}$ against different cell lines (values in $\mathrm{ng} \mathrm{ml}^{-1}$ )

| Compound | Cell line HM02 |  |  | Cell line HEPG2 |  |  |  | Cell line MCF7 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{GI}_{50}$ | $\mathrm{TGI}^{*}$ | $\mathrm{LC}_{50}$ | $\mathrm{GI}_{50}$ | $\mathrm{TGI}^{*}$ | $\mathrm{LC}_{50}$ | $\mathrm{GI}_{50}$ | $\mathrm{TGI}^{*}$ | $\mathrm{LC}_{50}$ |  |
| $\mathbf{5}$ | 0.36 | 2.3 | 90 | 0.8 | $>100$ | $>100$ | 1.1 | $>100$ | $>100$ |  |
| $\mathbf{5 0}$ | $<5.0$ | 24 | 250 | 13 | $>500$ | $>500$ | 16 | $>500$ | $>500$ |  |
| $\mathbf{5 1}$ | 17.0 | $>100$ | $>100$ | 85 | $>100$ | $>100$ | 25 | $>100$ | $>100$ |  |
| $\mathbf{5 2}$ | $>100$ | $>100$ | $>100$ | $>100$ | $>100$ | $>100$ | $>100$ | $>100$ | $>100$ |  |

* TGI: concentration at which a complete inhibition of cell growth was observed.

This study shows that the stereochemistry at C10 is very important ( $10 R: 10 S=1: 200$ ), and it was suggested that it has a major influence on the overall conformation of the molecule by minimization of allylic and homoallylic strain. Indeed, such factors often govern conformation of open-chain compounds. ${ }^{12}$ This suggestion was confirmed by modelling studies. The configuration at C5, which is extremely important in callystatin A (5R:5S =
$1: 350),{ }^{50}$ does not have such a pronounced influence in ratjadone ( $5 R: 5 S=1: 20$ ). Also, the absolute stereochemistry of the THP ring is relatively unimportant. Indeed, omission of all THP substituents only leads to minor loss of activity. This is somewhat surprising, since the presence of hydroxy and keto functionalities at the correct positions in the left-hand side of callystatin A are of major importance for the activity. ${ }^{51}$ It should, however, be noted that although activity may be retained in this compound, the pharmalogical profile might differ significantly from natural ratjadone.

In addition, the fact that compounds lacking a complete lactone functionality show a complete loss of tumor growth inhibition demonstrates that the $\alpha, \beta$-unsaturated lactone is crucial for the biological activity. Finally, replacement of the hydroxyl group at C16 by a keto function results in a major loss of biological activity, indicating that this functionality is important for receptor binding.

### 1.3 Aim of the project

We recognized a linear terpenoid-like structure in the polyene chain of ratjadone and decided to employ our experience in the application of bifunctional terpenoid building blocks in total synthesis to construct ratjadone analogues with terpenoid-derived polyene spacers.

We considered two different approaches to such compounds. Initially, the use of a onecarbon elongated farnesol derivative as a C5-C17 fragment was explored. Preliminary studies following this strategy showed that it had some complications mainly due to difficulties in synthesis and instability of aldehydes of type 56, limiting efficiency and flexibility.

Figure 1.7. Retrosynthetic analysis of ratjadone analogues based on C 1 -elongated farnesol derivatives

In an alternative approach, bifunctional derivatives of geraniol and nerol (59) were considered as C7-C14 fragments and connected to preconstructed C1-C6 (60) and C15-C24 (58) fragments.

Figure 1.8. Retrosynthetic analysis of ratjadone analogues based on geraniol/nerol derivatives. Numbering is based on ratjadone numbering.

This strategy is similar to the convergent total synthesis strategy of Kalesse, and combines three building blocks of comparable size, i.e. A (THP ring, 58), B (chain, 59), and C (lactone, 60) fragments. The possibility for diversity enhancement is increased, since not only the THP fragment can be varied, but also the polyene chain, by varying source (geraniol vs. nerol) and orientation of the bifunctional terpene derivative (Fig. 1.9).

64

Figure 1.9. Different ratjadone mimics, varying in terpene source (geraniol (left) vs. nerol (right)) and orientation ( $\rightarrow$ vs. $\leftarrow$ ).

Kalesse et al. suggested a 3D structure in which the $\mathrm{C} 1-\mathrm{C} 9$ and $\mathrm{C} 11-\mathrm{C} 24$ moieties are perpendicular, imposed by C10 stereochemistry (due to allylic strain and syn-pentane interactions, Fig. 1.10) to rationalize the extreme difference in activity between natural (+)ratjadone and its $10 S$ isomer. ${ }^{49}$ We calculated the minimum energy conformations for compounds 61-64 (with the same THP ring as natural ratjadone) and found that compound 61 in the low energy region adopts a very similar conformation as the natural product. It was therefore decided that the target ratjadone analogues should have a geraniol-derived terpenoid fragment in the same orientation as in $\mathbf{6 1}$ (Fig. 1.9).

Figure 1.10. Twisted conformation of ratjadone chain governed by allylic strain and syn-pentane interactions suggested by Kalesse. ${ }^{49,52}$

Altogether, the route suggested in Fig. 1.8 can be deemed the most promising route with respect to accessability and variability. In combination with versatile new and existing routes to each of the components, this strategy should provide access to a wide variety of ratjadone analogues.

## fragment

## 2 Synthesis of the ratjadone analogue A fragment

### 2.1 Retrosynthesis

The C15-C24 polyketide domain, or the A fragment, represents the greatest challenge from a synthetic point of view, containing five stereocenters and a six-membered ring. The ideal building block would be aldehyde ent-12, also featured in Kalesse's total synthesis of ratjadone (Fig. 2.1). ${ }^{1,2}$

Figure 2.1. THP fragment building block ent-12.

In this synthesis, the required linear precursor was synthesized by sequential Evans asymmetric aldol and vinylogous Mukaiyama aldol reactions ${ }^{3}$ followed by epoxidation, and then cyclized by intramolecular epoxide opening. Although this is an effective and elegant route for total synthesis, it requires the use of an expensive chiral auxiliary $[(R)-4-$ benzyloxazolidin-2-one] and is limited with respect to variation of the substituents on the ring. For our study towards ratjadone analogues, a method was required that would provide rapid access to structurally varied THPs. However, few general synthetic methods to substituted THPs are known. Two methods that have been employed for the synthesis of complex THP systems are the hetero Diels-Alder reaction and Prins-type cyclizations. The former is a Lewis acid-mediated formal [4+2] cycloaddition, and the latter is a cationic
cyclization of a species derived from a hemiacetal of a homoallylic alcohol and an aldehyde (see Fig 2.2).

Figure 2.2. Prins cyclization

Recently, the Prins cyclization and related reactions have attracted significant attention from the synthetic community. ${ }^{4-13}$ The original Prins cyclization involved a reaction between an aldehyde and a homoallylic alcohol, but recently variations involving e.g. preconstructed hemiacetal acetates have been described. ${ }^{6,13}$ Such reactions have been successfully employed in the total and partial synthesis of natural products. An important advantage of this methodology is the possibility to construct tetrahydropyrans from readily available starting materials, namely simple aldehydes and homoallylic alcohols, which are available in enantiomerically pure form by Brown allylation (or crotylation). In some cases, yields and diastereoselectivities of Prins(-type) cyclizations are somewhat disappointing, although cases have been described where both yield and diastereoselectivity are excellent. ${ }^{6,13}$ A major drawback of this type of reaction is the formation of side products, probably arising from an oxonia-Cope-type rearrangement, ${ }^{6,12}$ especially when substituents at the 2- or 6-position stabilize the cationic intermediate.

Scheme 2.1. Rychnovsky's synthesis of a pentasubstituted tetrahydropyran towards phorboxazoles. (a) cat. $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{AcOH}, 52 \%$.

Rychnovsky and co-workers described the synthesis of the C22-C26 THP segment of the phorboxazoles (cf. Fig. 1.1) by a stereoselective Prins cyclization of hemiacetal acetate 67
(Scheme 2.1). ${ }^{13}$ The resulting THP 69 shows significant similarity to the desired THP fragment for ratjadone analogs.

In order to construct such a fragment, cyclization precursor 70 would be required (Scheme 2.2). Hemiacetal acetate 70 would be available through asymmetric crotylation of crotonaldehyde and subsequent esterification with known (R)-(2O,3Oisopropylidene)glyceric acid, followed by DIBAL-H reduction and subsequent acetylation in analogy to Rychnovsky's synthesis. ${ }^{13}$

Scheme 2.2. Hypothetical Prins-type cyclization of hemiacetal acetate 70; divergent reaction pathways leading to a tetrahydropyran (a) and tetrahydrofuran (b) product.

However, the important difference with the phorboxazole fragment lies in the presence of the propenyl substituent. Here, in addition to the THP Prins cyclization path (a) leading to 72, an alternative cationic cyclization (b) to form THF compound 73 is possible. Such THF-forming Prins cyclizations are well-known reactions. Also, the propenyl substituent makes the cationic intermediate prone to oxonia-Cope-type rearrangements. ${ }^{6,11}$ Therefore, this route was considered unlikely to be successful and was abandoned.
During the preparation of this manuscript, Cossey and Funk described the construction of THP fragment 28 (an intermediate in Kalesse's total synthesis of ratjadone) via a Prins-type cyclization of enecarbamate 76 (Scheme 2.3). ${ }^{14}$ This strategy is based on an alternative bond construction, and employs a variation of the Prins cyclization that had not been previously described in literature. Obviously, this route provides very fast and efficient access to 28.

Scheme 2.3. (a) tBuLi, $-78^{\circ} \mathrm{C} \rightarrow-50^{\circ} \mathrm{C}, 1.1 \mathrm{~h}$, then $75, \mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O},-78^{\circ} \mathrm{C}, 3 \mathrm{~h}, 62 \%$; (b) $\mathrm{CH}_{3} \mathrm{CH}=\mathrm{CHCHO}$, $\mathrm{InCl}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 84 \%$; (c) $\mathrm{Al}(\mathrm{iBu})_{3}$, hexanes, $-30^{\circ} \mathrm{C}, 1.5 \mathrm{~h}, 95 \%$ (ax./eq. $=48: 52$ ); (d) TBAF, THF, $100 \%$.

Another excellent method for the construction of multiply substituted THPs is the hetero Diels-Alder (HDA) reaction. The HDA reaction is formally analoguous to the well-known Diels-Alder reaction, with the difference that one (or more) of the carbon atoms of either the diene or the dienophile is substituted by a heteroatom. Many variations of the HDA reaction have been described. ${ }^{15}$ The version that is relevant to this study is the Lewis acidcatalyzed reaction between an electron-rich diene (often activated by oxygen substituents) and an aldehyde (see example Scheme 2.4). In the early 1980s, Danishefsky and coworkers first demonstrated the synthetic potential of this reaction. ${ }^{16-18}$ This work mainly concerned reactions between Danishefsky's diene [1-methoxy-3-(trimethylsilyloxy)butadiene, 78] (or derivatives) and aromatic aldehydes.

Scheme 2.4. (a) various Lewis acids.

The possibility to construct a substituted THP system (typically a dihydro- $\gamma$-pyrone) by forming a carbon-carbon and a carbon-oxygen bond in a single step contributed to the popularity of the HDA reaction. Up to three stereocenters can be formed in the reaction (as well as a fourth one after desilylation, and a fifth one by induction), and different groups have pursued development of a catalytic asymmetric version. Danishefsky and co-workers reported the first example. ${ }^{19}$ More recently, several other chiral Lewis acid catalysts were developed, including aluminum ${ }^{20,21}$ and boron ${ }^{22,23}$ complexes (Fig. 2.3).

81

(S)-82

Figure 2.3. Aluminum- and boron-based asymmetric HDA catalysts

Most of these, however, require doubly activated dienes such as Danishefsky's diene 78 as substrate, which limits their applicability substantially. Only Jacobsen's recently developed $\mathrm{Cr}\left(\right.$ III ) catalysts 83a and 83b (Scheme 2.5) accept monoactivated dienes as substrates. ${ }^{24}$ The applicablity of these catalysts was demonstrated by the catalytic asymmetric construction of di- or tetrahydropyran building blocks in the total synthesis of natural products. ${ }^{25-27}$ Catalysts 83a and 83b were also shown to induce high stereoselectivities in inverse electron demand HDA reactions. ${ }^{28,29}$

Scheme 2.5. (a) (i) Mol. Sieves $4 \AA$ § 83a or b ( $0.5-3 \mathrm{~mol} \%$ ); (ii) AcOH, TBAF, THF, $97 \%$ ( $>99 \% \mathrm{ee},>95 \%$ de).

Paterson and Lockhurst recently demonstrated that this catalyst may also be applied in more complex systems, using a catalytic asymmetric HDA reaction for the construction of a phorboxazole A fragment. ${ }^{30}$ However, applicability still seems to be limited, depending on the nature of the aldehyde and steric bulk of either of the substrates.

Especially $\alpha, \beta$-unsaturated aldehydes lack reactivity and typically require doubly activated dienes as reaction partners. ${ }^{17}$ Their incorporation is highly desirable, since the resulting exocyclic vinyl group provides the THP-building block with a handle for metathetic connection or macrocyclization procedures. Unfortunately, to the best of our knowledge, no
diastereo- or enantioselective HDA reaction of $\alpha, \beta$-unsaturated aldehydes with monoactivated dienes has been described so far.

Scheme 2.6. Cink and Forsyth's synthesis towards phorboxazole $\mathrm{A}^{31}$; (a) $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{Et}_{2} \mathrm{O},-78^{\circ} \mathrm{C}$; (b) TBAF, TsOH, THF, $60 \%$ over two steps; Synthesis of medium-sized ring ethers by Mujica et al. ${ }^{32}$ : (c) $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{Et}_{2} \mathrm{O},-25^{\circ} \mathrm{C}, 82 \%$; (d) TBAF, THF, $98 \%$.

Another means of controlling the stereochemical outcome of the HDA reaction is the use of enantiomerically pure starting materials. After a first observation by Danishefsky, ${ }^{18}$ several examples of asymmetric HDA reactions with enantiomerically pure chiral aldehydes have been described (Scheme 2.6). ${ }^{31,32}$ Martin et al. have demonstrated a synergistic effect between a chiral aldehyde and a chiral diene (Scheme 2.7). ${ }^{33}$

Scheme 2.7. (a) $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{Et}_{2} \mathrm{O},-15^{\circ} \mathrm{C}, 74 \%$.

Hu et al. described an asymmetric HDA reaction using a chiral diene and a chiral Co (II) salen catalyst. ${ }^{34}$ Similary, Jacobsen and co-workers reported match/mismatch effects when using chiral aldehydes and catalysts 83a and 83b (or enantiomers). ${ }^{35}$

We considered the use of an HDA reaction for the construction of the ratjadone THP fragment and analogues, envisioning ketone $\mathbf{9 4}$ as a precursor for building block ent-12. There are two possible retrosynthetic disconnections to form ketone $\mathbf{9 4}$ by HDA reaction ( $a$ and $b$, Fig. 2.4).

Figure 2.4. Possible retrosynthetic routes to 94 using HDA reactions

Since aldehyde 87 is known to induce stereochemistry in similar HDA reactions, ${ }^{18,31,32}$ route $b$ was initially considered promising. Preliminary studies soon showed that silyloxytriene 96 is unable to react as a diene in HDA reactions, presumably due to delocalization of electrons in the conjugated system. Therefore, route $a$ was explored further.

Unfortunately, $\alpha, \beta$-unsaturated aldehydes are notoriously bad dienophiles in HDA reactions. Also, no previous examples of diene-controlled asymmetric HDA reactions were found in literature. A synergistic effect between a chiral aldehyde and a chiral diene has been described. However, the similar reaction using a chiral aldehyde as the sole source of chirality produced a similar result, which makes the contribution to stereochemical induction by the chiral diene unclear. ${ }^{33}$

Also, it was difficult to predict which of the two expected all-cis diastereomers would dominate in such a diene-controlled HDA reaction. Since Kalesse and co-workers reported that absolute stereochemistry of the substituents in this fragment only has limited impact on the biological activity, ${ }^{36}$ and because this project is diversity- rather than target-oriented, we decided to further pursue this route in order to construct various THP fragments for ratjadone analogues.

### 2.2 Synthesis of THP fragments of ratjadone analogues

We started with the construction of silyloxydiene 95. The chirality is derived from aldehyde 87, which can be prepared in two straightforward steps from inexpensive mannitol. Efficient large-scale procedures to 87 have been described. ${ }^{37,38}$ The other required component is ylide 97, available by $\alpha^{\prime}$-alkylation of (triphenylphosphoranylidene)-acetone (98). ${ }^{39}$ Wittig reaction between aldehyde 87 and ylide 97 affords the required enone 99. Subsequent treatment with TBSOTf in the presence of $\mathrm{Et}_{3} \mathrm{~N}$ readily yields diene $\mathbf{9 5}$ without loss of enantiomeric purity.

Scheme 2.8. (a) $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, rt, $42 \%$; (b) TBSOTf, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{Et}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}, 88 \%$.

The subsequent hetero Diels-Alder reaction between diene 95 and crotonaldehyde (Scheme 2.9) was performed according to the conditions described by Mujica et al. ${ }^{32}$

Scheme 2.9. (a) $\mathrm{CH}_{3} \mathrm{CH}=\mathrm{CHCHO}$ (1.5 eq.), $\mathrm{BF}_{3} \bullet \mathrm{Et}_{2} \mathrm{O}$ (1.5 eq.), $\mathrm{Et}_{2} \mathrm{O},-30^{\circ} \mathrm{C}, 97 \%$; (b) AcOH (2.5 eq), TBAF (1.5 eq.), THF, $87 \%$.

With some minor modifications ( 1.0 eq. diene, 1.5 eq. aldehyde, 1.5 eq. $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, 1.5 \mathrm{~h}$ at $-30^{\circ} \mathrm{C}$ ), the reaction proceeded in excellent yield $(97 \%$, in a $4: 1$ mixture of diastereomers, which was obtained without further purification.

Thus, the complete skeleton of the desired building block including introduction of four chiral centers was achieved in only three steps from known, easily available compounds. The crude diastereomeric mixture was then desilylated by treatment with TBAF in the presence of AcOH to prevent partial epimerization at C3. The resulting isomers 94a and $\mathbf{9 4 b}$ were readily separated by flash chromatography ( $\mathbf{9 4 a} \mathbf{9 4} \mathbf{9} \mathbf{b}=4: 1$ ). Both diastereomers were assigned the all-cis configuration of the ring substituents based on ${ }^{1} \mathrm{H}$ NMR coupling constants.

Figure 2.5. Two all-cis diastereomers 94a and 94b.

Since X-ray analysis to unambiguously assign the absolute configuration was not possible because the compounds are oils, it was decided to further convert the main isomer 94a. If it would have the desired $(2 S, 3 R, 6 S)$ configuration, the reaction sequence described below (Scheme 2.10) would afford triol 101a, a known compound from Kalesse's total synthesis of $(+)$-ratjadone. ${ }^{2}$ This transformation required selective reduction of the ketone function to the axial alcohol. Cink and Forsyth described a similar case, where reduction with K-Selectride ${ }^{\circledR}$ was most successful. ${ }^{31}$ Thus, the ketone function of 94a was reduced with K-Selectride ${ }^{\circledR}$ to give a 1:4 mixture of axial alcohol 102a and equatorial alcohol 102b (in quantitative yield), which were easily separated by flash chromatography. Other reduction methods were investigated (see below), but none led to a higher yield of axial alcohol 102a. The relative stereochemistries of alcohols $102 a$ and $\mathbf{1 0 2 b}$ were assigned by ${ }^{1} \mathrm{H}$ NMR shifts and coupling constants, and further confirmed for 102a by NOESY. Subsequent removal of the isopropylidene group furnished triol 101b, which was shown to be not identical to 101a by comparison of ${ }^{1} \mathrm{H}$ NMR spectra. ${ }^{2}$

Scheme 2.10. (a) K-Selectride, THF, $-78^{\circ} \mathrm{C}(100 \%$, eq.:ax. $=80: 20)$; (b) PPTS, acetone $/ \mathrm{H}_{2} \mathrm{O} 1: 1,58 \%$.

A rationale for the observed diastereoselectivity of the HDA reaction leading to 94 may be provided by considering the approach of the aldehyde dienophile to diene 95. Figure 2.6 shows a Newman projection of the C3-C2 bond in 95, suggesting that the dienophile is more likely to approach the diene from the sterically less hindered top face. A (pseudo-) concerted, disrotatory reaction mechanism would then preferentially lead to 94a.

Figure 2.6. Sterically more favorable approach of the dienophile to diene $\mathbf{9 5}$.

In contrast to the K-Selectride ${ }^{\circledR}$ reduction of 94a, the reduction of ketone $\mathbf{1 0 3}$ (lacking the methyl substituent at the 3 -position of the THP ring, synthesis v.i.) with K-Selectride ${ }^{\circledR}$ primarily afforded the axial alcohol 105a, whereas reduction of a similar compound with an ethyl $\alpha$-substituent (104a) under the same conditions furnished exclusively the equatorial alcohol.

| Compound | $\boldsymbol{R}$ <br> $=$ | Ratio <br> ax.:eq. |

|  |  |  |

Scheme 2.11. (a) K-Selectride ${ }^{\circledR}$, THF.
$\mathrm{Cr}($ II ) amino acid complexes have been successfully employed in the diastereoselective reduction of ketones. ${ }^{40-42}$ In cooperation with Dr. K. Micskei of Debrecen University, Hungary, reduction of ketones 103a, 94a, and 104a (with an ethyl substituent in 3-position, synthesis v.i.) with $\mathrm{Cr}(\mathrm{II})$ amino acid complexes were investigated. ${ }^{\dagger}$ Complexes of $\mathrm{Cr}(\mathrm{II})$ with several achiral (IDA, NTA and EDTA) and chiral (L-valine, L-histidine) amino acids were tested (Table 2.1). ${ }^{\ddagger}$

The results in Table 2.1 clearly demonstrate that reductions of THP-4-ones with $\operatorname{Cr}$ (II) amino acid complexes depend strongly on $\alpha$-substitution of the ketone. In the absence of $\alpha$-substituents (ketone 103a), most of the employed complexes successfully reduced the ketone to the corresponding alcohols. With ketone 94a, which carries a methyl substituent in 3-position, only the $\operatorname{Cr}$ (II) NTA complex was successful, possibly indicating that a delicate balance between reactivity and limited steric hindrance is required here. Ketone 104a, with an ethyl substituent, was not reduced by any of the complexes.

[^1]Table 2.1. Reduction of THP-4-ones with $\mathrm{Cr}(\mathrm{II})$ amino acid complexes

${ }^{a}$ n.r.: No reaction; ${ }^{b}$ n.t.: Not tested; ${ }^{\text {c }}$ two amino acids coordinated to each $\mathrm{Cr}(\mathrm{II})$ ion.

The most remarkable observation made during these reductions is the fact that the observed diastereoselectivity is relatively independent of both the amino acid and the ketone; it is typically 40:60 (ax./eq.). Indeed, for ketone 94a, this means an increase of the ax./eq. ratio with respect to the K -Selectride ${ }^{\circledR}$ reduction. However, since the isolated yield was not quantitative and the reaction is somewhat more difficult to perform than K-Selectride ${ }^{\circledR}$ or $\mathrm{NaBH}_{4}$ reduction, this method was not further exploited.

Thus, the main product does not have the same absolute stereochemistry as the corresponding ratjadone fragment when the (S)-isomer of diene $\mathbf{9 5}$ is used, nor is selective reduction of the ketone to the required axial alcohol efficient. We attempted to improve the diastereomeric ratio by subjecting diene $\mathbf{9 5}$ and crotonaldehyde to a catalytic asymmetric HDA reaction using Jacobsen's HDA catalyst 83a. ${ }^{24}$ Unfortunately, no reaction was observed, not even at higher temperature and longer reaction time. This may be caused either by poor reactivity of the $\alpha, \beta$-unsaturated aldehyde or mismatch effects of the chiral diene and the catalyst, as was also described by Jacobsen and co-workers. ${ }^{35}$

Scheme 2.12. (a) crotonaldehyde, mol. sieves $4 \AA$, 83a ( $3 \mathrm{~mol} \%$ ), no reaction.

However, the described route provides rapid and efficient access to highly functionalized THP ring systems with defined stereochemistry. Thus, it is suitable for the construction of A ring analogues of ratjadone, but not immediately useful for the original ratjadone A fragment, which is not mandatory for activity anyway. ${ }^{36}$
Reduction of ketone 94a with $\mathrm{NaBH}_{4}$ afforded exclusively equatorial alcohol $\mathbf{1 0 2 b}$ in quantitative yield. Because of the excellent availability of this compound, it was used for further synthetic studies. The isopropylidene group was efficiently removed by treatment with 1.0 eq. of PPTS in MeOH . Other methods $\left(\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}, \mathrm{CH}_{3} \mathrm{CN}\right.$; PPTS, acetone $/ \mathrm{H}_{2} \mathrm{O}$ ) were also successful but required long reaction times ( $>7 \mathrm{~d}$ ).

Scheme 2.13. (a) $\mathrm{NaBH}_{4}, \mathrm{MeOH}, 100 \%$; (b) PPTS, $\mathrm{MeOH}, 88 \%$; (c) TBSOTf, 2,6-lutidine, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}$, $99 \%$; (d) $\mathrm{HCl}, \mathrm{CHCl}_{3}, 91 \%$; (e) Dess-Martin periodinane, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 84 \%$.

Subsequent transformation to aldehyde $\mathbf{1 0 8}$ was achieved in analogy to Kalesse's total synthesis of (+)-ratjadone. ${ }^{1,2}$ Triple TBS protection followed by selective cleavage of the primary TBS ether $\left(\mathrm{HCl}, \mathrm{CHCl}_{3}\right)$ furnished alcohol 107. Dess-Martin oxidation ${ }^{43}$ resulted in adequately protected aldehyde 108.

Attempts were also made to construct the original A ring building block ent-12 from $\mathbf{9 4 b}$. Ketone 94b was smoothly converted to the corresponding equatorial alcohol 109. Then, the

C4 stereocenter had to be inverted. In a first study, Mitsunobu inversion ${ }^{44}$ was accompanied by $\beta$-elimination, as well as the formation of a third, unidentified product. The desired inversion product 110 was obtained in a modest $33 \%$ yield, and was still contaminated with large quantities of diisopropyl hydrazinedicarboxylate. With a larger amount of $\mathbf{1 1 0}$ in hand, aldehyde ent-12 would be available in analogy to 108. Unfortunately, repetition of the Mitsunobu reaction on preparative scale failed.

Scheme 2.14. (a) $\mathrm{NaBH}_{4}$, MeOH , quant.; (b) DIAD, $\mathrm{Ph}_{3} \mathrm{P}, \mathrm{AcOH}, \mathrm{THF}, 33 \%$.

In order to investigate the scope and exploit the efficiency of the described HDA methodology, a number of derivatives of ketone 94 were synthesized.
$\beta$-Keto ylides 111-113 were obtained by alkylation of ylide 98 with the appropriate alkyl iodides after deprotonation with $n$-BuLi (Table 2.2). ${ }^{39}$ Enones $\mathbf{1 1 4 - 1 1 7}$ were obtained by Wittig reaction of aldehyde 87 with ylides 98, 97, 111, and 112, respectively, as summarized in Table 2.1. In all cases, only the E-enone was isolated, the Z-product was either absent or present as a minor impurity that was easily removed by flash chromatography. This in contrast to a literature report, where $\mathbf{1 1 4}$ was formed in a 3:1 $\mathrm{E} / \mathrm{Z}$ ratio. ${ }^{34}$ Yields of this step varied and were sometimes mediocre. This is probably caused by difficulties in the purification of the $\beta$-keto ylides. Enones 99 and 114-116 were smoothly converted to the corresponding TBS enol ethers 95 and 117-119.

Hu et al. reported that treatment of 117 with $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ resulted in decomposition. ${ }^{34}$ Whereas we found this to be true at room temperature, $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$-mediated decomposition of silyloxydienes $\mathbf{9 5}$ and $\mathbf{1 1 7 - 1 1 9}$ was not observed at temperatures below $-20^{\circ} \mathrm{C}$. Thus, dienes 95 and 117-119 were subjected to $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$-mediated HDA reaction with crotonaldehyde or cinnamaldehyde between $-20^{\circ} \mathrm{C}$ and $-35^{\circ} \mathrm{C}$. The resulting dihydropyrans were desilylated to give tetrahyropyran-4-ones (Table 2.3).

Yields (Table 2.3) and diasteromeric ratios (Table 2.4) of the HDA products range from good to excellent. The isolated tetrahydropyran-4-ones 103, 104, and 127-131 were typically mixtures of the two isomers that have all-cis configuration of the ring substituents, as was the case for 94 . This was confirmed by NOE spectroscopy for 131a and based on analogy of ${ }^{1} \mathrm{H}$ NMR coupling constants for the other tetrahydropyran-4-ones. Diastereomeric ratios are summarized in Table 2.4.

In case of 131, a minor amount ( $\sim 5 \%$ ) of a third isomer (131c, thought to be a compound with a trans relationship of the 2 - and 6 -substituents) could also be isolated. Its ${ }^{1} \mathrm{H}$ NMR spectrum displays many similarities with 131a and 131b, but the proton at 6-position shows a significant downfield shift with respect to the two major compounds. Third isomeric products were also observed for 103 and 127, but these were inseparable from 103b and 127b, respectively. Amounts of these isomers never exceeded $5 \%$.

HDA reaction of diene 117 with ethyl glyoxylate under various conditions, including $\mathrm{Co}(\mathrm{II})$ salen catalysis, has been reported to afford not only both cis diastereomers, but both trans isomers as well. ${ }^{34}$ These results suggest that the products arise from a tandem Mukaiyama-Michael-type addition, rather than a (pseudo-)concerted [4+2] cycloaddition. The HDA reactions described in this study employ $\alpha, \beta$-unsaturated aldehydes (which are
typically less reactive than ethyl glyoxylate), and generally afford only the all-cis isomers. Thus, these reactions presumably proceed through a more selective (pseudo-)concerted [4+2] cycloaddition mechanism.

Further evidence for the exclusive formation of the all-cis products was supplied by HDA reaction of achiral dienes 132 and 133 (i.e. with an isopropyl group instead of the dimethyldioxolane substituent) with crotonaldehyde or cinnamaldehyde (Scheme 2.15). Here, only one pair of (enantiomeric) diastereomers of the desilylated HDA products 134-136 was formed. The all-cis configuration was confirmed by NOE spectroscopy for 135 and based on analogy of ${ }^{1} \mathrm{H}$ NMR coupling constants for the other tetrahydropyran-4ones 134 and 136. Dienes 132 and 133 were derived from ketones 137 and 138, which were obtained by Wittig reaction of ylides $\mathbf{1 1 1}$ and $\mathbf{1 1 3}$ with isobutyraldehyde.

Scheme 2.15. (a) TBSOTf, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{Et}_{2} \mathrm{O}$; (b) $\mathrm{R}^{2} \mathrm{CHO}, \mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{Et}_{2} \mathrm{O}$; (c) AcOH , TBAF, THF.

Interestingly, reaction of diene 139 (derived from ketone 140), which has an aromatic ring conjugated to the diene system, with crotonaldehyde and cinnamaldehyde gave the classical Diels-Alder adducts 141 and 142 as the sole isolated products, rather than the expected HDA products (Scheme 2.16).

Scheme 2.16. (a) TBSOTf, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{Et}_{2} \mathrm{O}$; (b) $\mathrm{RCH}=\mathrm{CHCHO}, \mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{Et}_{2} \mathrm{O},-30^{\circ} \mathrm{C}$.

A possible rationalization for this observation is a decrease in the HOMO energy of the diene through conjugation to the aromatic ring.

An expansion of the applicability of the current methodology would be the selective basecatalyzed epimerization at C3. Especially in the case of a bulky substituent, the equatorial position should be favored over the axial. Indeed, when 131a was treated with base, it was slowly converted to 131d (Scheme 2.17). The product was shown to be different from 131a, 131b and 131c by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR, showing coupling constants typical for a transrelationship of the C 2 and C 3 substituents.

Scheme 2.17. (a) KOtBu, MeOH, 2 d (53\%).

Even though the recovery rate needs to be improved, the isomerization provides easy access to related tetrahydropyran-4-ones with different relative configuration.

Another method to increase diversity within this strategy is nucleophilic addition to the ketone function. As an example, 128a was reacted with MeMgBr to afford a single diastereomer of tertiary alcohol 143 (Scheme 2.18). The excellent stereoselectivity is presumably caused by the adjacent axial methyl group, which makes equatorial attack unfavorable.

Scheme 2.18. (a) MeMgBr , $\operatorname{THF}$ ( $52 \%$ ).

Also in this case, the yield needs to be optimized. However, this reaction demonstrates that the described tetrahydro- $\gamma$-pyrones can be easily and selectively modified by nucleophilic addition.

Despite the fact that the described HDA reactions display a stereoselectivity preference opposite to the one desired for the ratjadone THP segment, its efficiency combined with the typically good stereocontrol spurred us to apply this methodology to a system in which it would lead to the desired absolute stereochemistry in the THP ring. Such a system was recognized in the phorboxazoles.

### 2.3 Synthesis of the phorboxazole C22-C26 THP ring

Phorboxazoles A (3a) and B (3b, see Fig. 2.7) are macrocyclic marine natural products isolated by Searle and Solinski ${ }^{45}$ from the sponge Phorbas sp.. They show remarkable cytotoxicity (mean $\mathrm{GI}_{50}<0.79 \mathrm{nM}$ ) against the full US NCI panel of 60 human cancer cell lines. The phorboxazoles cause cell cycle arrest in the S phase by a thus far unknown mechanism. Such a mode of action would be complementary in cancer therapy to e.g. microtubule-stabilizing agents such as paclitaxel or the epothilones. ${ }^{46,47}$ This extraordinary biological activity, combined with the challenging structure and restricted access to natural material have attracted great interest in the synthetic community, culminating in total syntheses by the groups of Forsyth, ${ }^{48}$ Evans, ${ }^{49-51}$ and Smith, ${ }^{52}$ and several other groups reported partial syntheses. ${ }^{13,53-58}$ Several approaches made use of asymmetric HDA methodology, including aldehyde- ${ }^{31}$ and catalyst-controlled ${ }^{30}$ variants.

Figure 2.7. Structures of phorboxazoles A and B.

Both phorboxazole A and B feature a 25 -membered macrocycle and a linear side chain. They contain two oxazole rings and no less than four tetrahydropyran rings, three of which are embedded in the macrocycle. Most probably, these substituted THP rings play a prominent role in the overall conformation of the macrocycle. Synthetically, they constitute the major challenge in these molecules. Recently, Paterson and Lockhurst elegantly showed that Jacobsen's catalytic asymmetric hetero Diels-Alder (HDA) methodology ${ }^{24}$ may be employed to combine two advanced intermediates (forming the C11-C15 THP ring), leading to formation of the major part of the macrocylic skeleton. ${ }^{30}$ Indeed, the HDA reaction may be the most efficient method for the stereocontrolled construction of THP rings. However, no examples of catalytic asymmetric HDA reaction in the synthesis of sterically demanding systems such as the phorboxazole C22-C26 THP ring have been described to date. Therefore, we decided to employ our diene-controlled asymmetric HDA methodology for the fast and efficient synthesis of phorboxazole C20-C32 fragment 144, previously reported by Paterson and Luckhurst in their synthesis of an advanced C4-C32 fragment. ${ }^{30}$ Our retrosynthetic analysis of $\mathbf{1 4 4}$ is shown in Fig. 2.8.

Figure 2.8. Retrosynthetic analysis C20-C32 segment of phorboxazoles.

The key step is the diene-controlled HDA reaction between diene 146 and 3-benzyloxypropionaldehyde, leading to the all-cis HDA product. Absolute stereochemistry is induced by the C27 stereocenter (derived from D-lactate), which disappears in a later step. Thus, absolute stereochemistry can be switched simply by starting with the other lactate enantiomer (traceless induction). The C24 and C25 stereocenters are to be set by hydrolysis of the intermediate TBS enol ether and subsequent borohydride reduction, respectively, placing both substituents in the thermodynamically favored equatorial position.

The synthesis commenced with a Wittig reaction between known ylide $147^{59,60}$ and D -lactate-derived aldehyde 148. The latter was synthesized from commercially available isobutyl D-lactate (149) in three straightforward steps (Scheme 2.19).

Scheme 2.19. (a) $\mathrm{NaH}, \mathrm{BnBr}$, DMF, $99 \%$; (b) $\mathrm{LiAlH}_{4}$, THF, $100 \%$; (c) $(\mathrm{COCl})_{2}$, $\mathrm{DMSO}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, $74 \%$.

Aldehyde 148 was then used in a Wittig reaction with ylide $147 .{ }^{60}$ The resulting enone 152 (not shown) was not converted to the corresponding TBS enol ether under standard conditions (TBSOTf, $\mathrm{Et}_{3} \mathrm{~N}, 0^{\circ} \mathrm{C}$ ), probably due to the presence of an additional methyl group at the ketone $\alpha$-position. However, subsequent addition of one equivalent of NaHMDS to the reaction mixture at low temperature afforded the desired diene 146 in quantitative yield $(2 E / 2 Z=9: 1)$. The key $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$-mediated HDA reaction between diene 146 and 3-benzyloxypropionaldehyde (153, obtained by Swern oxidation ${ }^{61}$ of commercially available 3-benzyloxypropanol) led to a mixture of diastereomeric products in reasonable yield.

Scheme 2.20. (a) $\mathrm{CH}_{3} \mathrm{CN}$, r.t., $14 \mathrm{~h}, 75 \%$; (b) TBSOTf, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{Et}_{2} \mathrm{O}$, then $\mathrm{NaHMDS},-78 \rightarrow 0^{\circ} \mathrm{C}, 100 \%$, $2 E / 2 Z=9: 1$; (c) 1.5 eq. 3-benzyloxypropionaldehyde, 1.5 eq. $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{Et}_{2} \mathrm{O},-40^{\circ} \mathrm{C}, 2 \mathrm{~h}, 63 \%$; (d) 2.5 eq. $\mathrm{AcOH}, 1.5$ eq. TBAF, THF, r.t., $1 \mathrm{~h}, 65 \%$.

The crude mixture of HDA products 154 (not shown) was desilylated (AcOH, TBAF) to give ketones 155 in 14:66:8:12 mixture of diastereomers (155a-d), of which the latter two were not separated. The two additional isomers (with respect to the HDA reactions
described earlier in this chapter) may be derived from the $\sim 10 \%$ of $5 Z$-diene in 146. Isomer 155a was assigned the $(3 R, 5 R)$ configuration as shown in Scheme 2.20 by NOE spectroscopy. Unfortunately, the configuration of the other diastereomers could not be determined unequivocally.

Borohydride reduction of $\mathbf{1 5 5 b}$ led to the exclusive formation of a single diastereomer, presumably the equatorial alcohol 156.

Scheme 2.21. (a) $\mathrm{NaBH}_{4}, \mathrm{MeOH}, 0^{\circ} \mathrm{C}, 1 \mathrm{~h}, 72 \%$.

### 2.4 Conclusion

In conclusion, a versatile, unprecedented diene-controlled asymmetric HDA between $\alpha, \beta$ unsaturated aldehydes and monoactivated chiral dienes was developed, affording compounds that can be easily converted to highly substituted stereodefined THP building blocks for the construction of analogues of ratjadone and other natural products.

### 2.5 Experimental section

General. All commercial reagents were purchased from Fluka, Merck or Aldrich and used without further purification, unless otherwise stated. All oxygen- and water-sensitive reactions were carried out in ovendried glassware under argon. THF was distilled from potassium/benzophenone $\mathrm{ketyl}^{\mathrm{E}} \mathrm{Et}_{2} \mathrm{O}$ was distilled from sodium/potassium/benzophenone ketyl, and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was distilled from calcium hydride. Other dry solvents were purchased from Fluka. Flash chromatography was performed using silica gel 60 (230-400 mesh, Merck). Thin-layer chromatography (TLC) was performed using silica plates (Merck, silica gel 60 $\mathrm{F}_{254}$ ) and developed using Cer-MOP reagent [molybdatophosphoric acid ( 5.0 g ), cerium (IV) sulfate ( 2.0 g ), and concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}(16 \mathrm{ml})$ in water $\left.(200 \mathrm{ml})\right]$. Optical rotations were measured using a 1 ml cell with 1 dm path length on a Jasco DIP-1000 digital polarimeter. IR spectra were recorded as $\mathrm{CHCl}_{3}$ solutions or as thin films between NaCl plates on a Bruker IFS $28 .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded in $\mathrm{CDCl}_{3}$ on

Varian Mercury VX 300 and VX 400 spectrometers using TMS as internal standard. Chemical shifts $\delta$ are reported in parts per million (ppm), coupling constants $J$ are given in Hertz (Hz). High resolution ESI mass spectra were obtained from a Bruker Apex 70e Fourier transform ion cyclotron resonance mass spectrometer equipped with a 7.0 Tesla superconducting magnet and an external electrospray ion source (Agilent, off axis spray).

General procedure for $\alpha^{\prime}$-alkylation of 1-triphenylphosphoranylidenepropan-2-one (98): To a solution of 98 ( 1.0 eq.) in THF ( 0.125 M ) was added at $-78^{\circ} \mathrm{C} n-\mathrm{BuLi}(1.6 \mathrm{M}$ in hexane, 1.4 eq.). The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 1 h , then the appropriate alkyl iodide ( 1.4 eq .) was added and the mixture was allowed to warm to room temperature over night. The solvent was removed in vacuo, the residue was taken up in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the mixture was washed three times with $\mathrm{H}_{2} \mathrm{O}$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The off-white solid residue was washed with three portions of ice-cold ether and dried in vacuo to give the alkylated ylides as colorless or slightly brown solids, which were used immediately in the next reaction without further purification.

General procedure for Wittig reactions: To a solution of an ylide in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added an aldehyde and the mixture was stirred $24-48 \mathrm{~h}$ at room temperature. The solvent was removed in vacuo and the residue was extracted several times with EtOAc/hexane 1:4. The combined extracts were concentrated in vacuo and purified by flash chromatography.

General procedure for the synthesis of TBS enol ethers: To a solution of a ketone (1.0 eq.) in $\mathrm{Et}_{2} \mathrm{O}$ was added at $0^{\circ} \mathrm{C} \mathrm{Et}_{3} \mathrm{~N}$ (1.2 eq.) and then TBSOTf ( 1.1 eq.). The mixture was stirred for 1 h at $0^{\circ} \mathrm{C}$, then quenched by addition of sat. aq. $\mathrm{NaHCO}_{3}$ and extracted three times with $t \mathrm{BuOMe}$. The combined organic fractions were washed with brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo to give a slightly yellow oil. The crude product was purified by flash chromatography on a small, $\mathrm{Et}_{3} \mathrm{~N}$-neutralized column to give the TBS enol ethers.

General procedure for hetero Diels-Alder (HDA) reactions: To a solution of a diene in $\mathrm{Et}_{2} \mathrm{O}$ was added at $-30^{\circ} \mathrm{C}$ crotonaldehyde or cinnamaldehyde ( 1.5 eq.) and then $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ ( 1.5 eq.). The mixture was stirred at $-20^{\circ} \mathrm{C}$ to $-30^{\circ} \mathrm{C}$ for $1.5-4 \mathrm{~h}$ and then quenched by addition of $\mathrm{Et}_{3} \mathrm{~N}$ ( 3 eq .). The mixture was diluted with $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \mathrm{x} 35 \mathrm{ml})$. The combined organic fractions were washed with brine $(50 \mathrm{ml})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo to give the crude HDA products, which were analyzed by ${ }^{1} \mathrm{H}$ NMR for identity and diastereomeric ratio of the products and used in the next step without further purification.

General procedure for desilylation of TBS enol ethers: To a solution of a TBS enol ether in THF were added at $0^{\circ} \mathrm{C}$ acetic acid ( 2.5 eq.) and $\mathrm{TBAF} \cdot 3 \mathrm{H}_{2} \mathrm{O}$ ( 1.5 eq .). The mixture was stirred at room temperature until the starting material had been fully consumed (TLC). The mixture was diluted with sat. aq. $\mathrm{NaHCO}_{3}$ $(50 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 35 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, concentrated in vacuo and purified by flash chromatography.

E-(2S)-1,2-isopropylidenedioxy-3-hexen-5-one 114: 1-Triphenylphosphoranylidenepropan-2-one (98, $6.37 \mathrm{~g}, 20.0 \mathrm{mmol}$ ) and ( $R$ )-(+)-2,2-dimethyl-1,3-dioxolane-4-carboxaldehyde ( $3.00 \mathrm{~g}, 23.0 \mathrm{mmol}$ ) were reacted over 48 h according to the general procedure for Wittig reactions. The residue was purified by flash chromatography (column dimensions: $25 \times 3 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 4$ ) to give $114(2.725 \mathrm{~g}, 16.0 \mathrm{mmol}, 80 \%)$ as a colorless oil. $[\alpha]^{26}{ }_{\mathrm{D}}=+41.6\left(\mathrm{c}=1.02, \mathrm{CHCl}_{3}\right.$ ). HRMS: calcd. for $\mathrm{C}_{20} \mathrm{H}_{28} \mathrm{O}_{4}(\mathrm{M}+\mathrm{Na})^{+} 355.1880$ found 355.1881.

2-Bromopentan-3-one 147a: Bromine ( $17.7 \mathrm{ml}, 55.1 \mathrm{~g}, 345 \mathrm{mmol}$ ) was added to a solution of 3-pentanone $(36.6 \mathrm{ml}, 29.7 \mathrm{~g}, 345 \mathrm{mmol})$ in acetic acid $(48 \mathrm{ml})$ and $\mathrm{H}_{2} \mathrm{O}(72 \mathrm{ml})$ and reacted according to reference ${ }^{59}$ to give 2-bromopentan-3-one (147a, $32.0 \mathrm{~g}, 194 \mathrm{mmol}, 56 \%$ ) after distillation. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta=1.12(\mathrm{t}, J=7.42 \mathrm{~Hz}, 3 \mathrm{H}), 1.75(\mathrm{~d}, J=6.63 \mathrm{~Hz}, 3 \mathrm{H}), 2.61(\mathrm{dq}, J=17.95,7.42 \mathrm{~Hz}, 1 \mathrm{H}), 2.87(\mathrm{dq}, J=$ $17.95,7.42 \mathrm{~Hz}, 1 \mathrm{H}), 4.42(\mathrm{q}, J=6.63 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm}$.

2-(Triphenylphosphoranylidene)pentan-3-one 147: 2-Bromopentan-3-one (147a, $32.0 \mathrm{~g}, 194 \mathrm{mmol}$ ) was added to a solution of $\mathrm{PPh}_{3}(48.5 \mathrm{~g}, 185 \mathrm{mmol})$ in benzene and the mixture was reacted according to reference ${ }^{59}$ to give crude 147 as a slightly brown solid that was used in the next step without further purification. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=1.15(\mathrm{t}, J=7.41 \mathrm{~Hz}, 3 \mathrm{H}), 1.65(\mathrm{~d}, J=16.00 \mathrm{~Hz}, 3 \mathrm{H}), 2.42(\mathrm{q}$, $J=7.41 \mathrm{~Hz}, 2 \mathrm{H}), 7.40-7.70(\mathrm{~m}, 15 \mathrm{H}) \mathrm{ppm}$.

Isobutyl (R)-2-benzyloxypropanoate 150: Commercially available isobutyl D-lactate (149, $7.51 \mathrm{ml}, 7.31$ $\mathrm{g}, 50.0 \mathrm{mmol})$ was added at $0^{\circ} \mathrm{C}$ to a suspension of $\mathrm{NaH}(60 \%$ dispension in mineral oil, $2.00 \mathrm{~g}, 50.0 \mathrm{mmol})$ in DMF $(100 \mathrm{ml})$. The mixture was stirred for 5 min . at $0^{\circ} \mathrm{C}$ and benzyl bromide $(5.92 \mathrm{ml}, 8.55 \mathrm{~g}, 50.0$ mmol ) was added. The mixture was stirred for 1.5 h at rt , quenched by addition of $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{ml})$ and extracted with $\mathrm{PE}(5 \times 75 \mathrm{ml})$. The combined organic fractions were washed with $\mathrm{H}_{2} \mathrm{O}(100 \mathrm{ml})$ and sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{ml})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concetrated in vacuo to give crude $150(11.68 \mathrm{~g}, 49.4 \mathrm{mmol}$,
$99 \%$ ) as a colorless oil that was used in the next step without further purification. ${ }^{1} \mathrm{H} \mathrm{NMR}(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta=0.95(\mathrm{~d}, J=7.03 \mathrm{~Hz}, 6 \mathrm{H}), 1.45(\mathrm{~d}, J=7.02 \mathrm{~Hz}, 3 \mathrm{H}), 1.98(\mathrm{~m}, 1 \mathrm{H}), 3.91-4.00(\mathrm{~m}, 2 \mathrm{H}), 4.07(\mathrm{q}$, $J=7.02 \mathrm{~Hz}, 1 \mathrm{H}), 4.45(\mathrm{~d}, J=11.71 \mathrm{~Hz}, 1 \mathrm{H}), 4.72(\mathrm{~d}, J=11.71 \mathrm{~Hz}, 1 \mathrm{H}), 7.28-7.39(\mathrm{~m}, 5 \mathrm{H}) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.71$ $(\mathrm{EtOAc} / n$-hexane $=1: 4)$.
(R)-2-Benzyloxypropanol 151: Isobutyl ( $R$ )-2-benzyloxypropanoate ( $\mathbf{1 5 0}, 11.68 \mathrm{~g}, 49.4 \mathrm{mmol}$ ) was added at $0^{\circ} \mathrm{C}$ to a suspension of $\mathrm{LiAlH}_{4}(1.88 \mathrm{~g}, 49.4 \mathrm{mmol})$ in THF $(100 \mathrm{ml})$. The mixture was stirred for 5 min . at $0^{\circ} \mathrm{C}$, quenched by addition of sat.aq. $\mathrm{NH} 4 \mathrm{Cl}(300 \mathrm{ml})$, and extracted with $t \mathrm{BuOMe}(3 \times 250 \mathrm{ml})$. The combined organic fractions were washed with brine ( 300 ml ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concetrated in vacuo to give crude $151(8.20 \mathrm{~g}, 49.3 \mathrm{mmol}, 100 \%)$ as a colorless oil that was used in the next step without further purification. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=1.19(\mathrm{~d}, J=6.24 \mathrm{~Hz}, 3 \mathrm{H}), 2.02(\mathrm{dd}, J=8.20,4.30 \mathrm{~Hz}$, $1 \mathrm{H}, \mathrm{OH}), 3.48-3.54(\mathrm{~m}, 1 \mathrm{H}), 3.60-3.65(\mathrm{~m}, 1 \mathrm{H}), 3.66-3.73(\mathrm{~m}, 1 \mathrm{H}), 4.49(\mathrm{~d}, J=11.32 \mathrm{~Hz}, 1 \mathrm{H}), 4.66(\mathrm{~d}, J=$ $11.32 \mathrm{~Hz}, 1 \mathrm{H}), 7.27-7.38(\mathrm{~m}, 5 \mathrm{H}) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.23(\mathrm{EtOAc} / n-$ hexane $=1: 4)$.
(R)-2-Benzyloxypropanal 148: DMSO ( $3.91 \mathrm{ml}, 4.30 \mathrm{ml}, 55.0 \mathrm{mmol}$ ) was added at $-78^{\circ} \mathrm{C}$ to a solution of oxalyl chloride ( $2.40 \mathrm{ml}, 3.49 \mathrm{~g}, 27.5 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(125 \mathrm{ml})$. The mixture was stirred for 10 min . at $-78^{\circ} \mathrm{C}$ and $(R)$-2-benzyloxypropanol $(151,4.16 \mathrm{~g}, 25.0 \mathrm{mmol})$ was added dropwise. The mixture was stirred for an additional 20 min . at $-78^{\circ} \mathrm{C}$ and $\mathrm{Et}_{3} \mathrm{~N}(10.40 \mathrm{ml}, 7.59 \mathrm{~g}, 75.0 \mathrm{mmol})$ was added. The mixture was allowed to warm to room temperature, quenched by addition of sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(200 \mathrm{ml})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 150 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. Purification by flash chromatography (column dimensions $30 \times 4 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 4$ ) afforded 148 $(3.02 \mathrm{~g}, 18.4 \mathrm{mmol}, 74 \%)$ as a colorless oil. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=1.34(\mathrm{~d}, J=7.02 \mathrm{~Hz}, 3 \mathrm{H}), 3.90$ $(\mathrm{qd}, J=7.03,1.56 \mathrm{~Hz}, 1 \mathrm{H}), 4.60(\mathrm{~d}, J=11.71 \mathrm{~Hz}, 1 \mathrm{H}), 4.66(\mathrm{~d}, J=11.71 \mathrm{~Hz}, 1 \mathrm{H}), 7.29-7.38(\mathrm{~m}, 5 \mathrm{H}), 9.76$ $(\mathrm{d}, J=1.56 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.50(\mathrm{EtOAc} / n$-hexane $=1: 4)$.
(R)-(4E)-6-(Benzyloxy)-4-methylhept-4-en-3-one 152: To a solution of 2-(triphenylphospho-ranylidene)pentan-3-one ( $147,10 \mathrm{~g}, 28 \mathrm{mmol}$ ) in acetonitrile ( 100 ml ) was added $(R)$-2-benzyloxypropanal $(148,3.02 \mathrm{~g}, 18.38 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(1.70 \mathrm{ml}, 1.24 \mathrm{~g}, 12.29 \mathrm{mmol})$. The mixture was stirred overnight at rt . The solvent was removed in vacuo and the residue was extracted with several portions of EtOAc/n-hexane 1:4. The extracts were concentrated in vacuo and the residue was purified by flash chromatography (column dimensions: $30 \times 3.5 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 6)$ to give $152(3.22 \mathrm{~g}, 13.87 \mathrm{mmol}, 75 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta=1.09(\mathrm{t}, J=7.42 \mathrm{~Hz}, 3 \mathrm{H}), 1.31(\mathrm{~d}, J=6.64 \mathrm{~Hz}, 3 \mathrm{H}), 1.76(\mathrm{~d}, J=1.17 \mathrm{~Hz}, 3 \mathrm{H})$, $2.68(\mathrm{q}, J=7.42 \mathrm{~Hz}, 2 \mathrm{H}), 4.40(\mathrm{dq}, J=8.20,6.64 \mathrm{~Hz}, 1 \mathrm{H}), 4.42(\mathrm{~d}, J=12.10 \mathrm{~Hz}, 1 \mathrm{H}), 4.52(\mathrm{~d}, J=11.71$
$\mathrm{Hz}, 1 \mathrm{H}), 6.51(\mathrm{dd}, J=8.19,1.17 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \operatorname{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=8.5,11.5,20.2,30.3,70.6$, $71.5,127.5,128.1,128.3,137.0,138.1,142.7,202.2 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.81(\mathrm{EtOAc} / n$-hexane $=1: 4)$.
(R)-(2Z,4E)-6-Benzyloxy-3-(tert-butyldimethylsilyloxy)hepta-2,4-diene 146: To a solution of ketone 152 $(1.39 \mathrm{~g}, 6.00 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(1.25 \mathrm{ml}, 911 \mathrm{mg}, 9.00 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(30 \mathrm{ml})$ was added at $0^{\circ} \mathrm{C}$ TBSOTf $(1.65 \mathrm{ml}, 1.90 \mathrm{~g}, 7.20 \mathrm{mmol})$. The mixture was stirred for 2 h at $0^{\circ} \mathrm{C}$, but TLC analysis indicated that no reaction had taken place. The mixture was cooled to $-78^{\circ} \mathrm{C}$ and NaHMDS ( 1 M solution in THF, 6.00 ml , $6.00 \mathrm{mmol})$ was added. The mixture was allowed to warm to rt , diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{ml})$, and extracted with $t \mathrm{BuOMe}(3 \times 100 \mathrm{ml})$. The combined organic extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The residue was purified by flash chromatography on a $\mathrm{Et}_{3} \mathrm{~N}$-neutralized column (column dimensions: $20 \times 2 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 50)$ to give $146(2.09 \mathrm{~g}, 6.02 \mathrm{mmol}, 100 \%)$ as a colorless oil $(2 \mathrm{Z}: 2 \mathrm{E}=9: 1) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=0.11(\mathrm{~s}, 3 \mathrm{H}), 0.12(\mathrm{~s}, 3 \mathrm{H}), 1.01(\mathrm{~s}, 9 \mathrm{H}), 1.27(\mathrm{~d}, J=6.24 \mathrm{~Hz}$, $3 \mathrm{H}, 1.66, J=7.03 \mathrm{~Hz}, 3 \mathrm{H}), 1.74(\mathrm{~d}, J=0.78 \mathrm{~Hz}, 3 \mathrm{H}), 4.32(\mathrm{dq}, J=8.98,6.24 \mathrm{~Hz}, 1 \mathrm{H}), 4.32(\mathrm{~d}, J=11.71$ $\mathrm{Hz}, 1 \mathrm{H}), 4.55(\mathrm{~d}, J=11.71 \mathrm{~Hz}, 1 \mathrm{H}), 5.01(\mathrm{q}, J=7.03 \mathrm{~Hz}, 1 \mathrm{H}), 5.73(\mathrm{~d}, J=8.97 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=-3.7,-3.6,11.9,13.9,18.4,21.6,26.0,69.9,71.2,105.4,127.3,127.6,128.3,128.5$, $134.3,138.9,151.1 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.89(\mathrm{EtOAc} / n-$ hexane $=1: 8)$.

3-Benzyloxypropanal 153: DMSO ( $3.91 \mathrm{ml}, 4.30 \mathrm{ml}, 55.0 \mathrm{mmol}$ ) was added at $-78^{\circ} \mathrm{C}$ to a solution of oxalyl chloride $(2.40 \mathrm{ml}, 3.49 \mathrm{~g}, 27.5 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(125 \mathrm{ml})$. The mixture was stirred for 10 min . at $-78^{\circ} \mathrm{C}$ and commercially available 3-benzyloxypropanol (4.16 g, 25.0 mmol ) was added dropwise. The mixture was stirred for an additional 20 min . at $-78^{\circ} \mathrm{C}$ and $\mathrm{Et}_{3} \mathrm{~N}(10.40 \mathrm{ml}, 7.59 \mathrm{~g}, 75.0 \mathrm{mmol})$ was added. The mixture was allowed to warm to room temperature, quenched by addition of sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(200 \mathrm{ml})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 150 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. Purification by flash chromatography (column dimensions $30 \times 4 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=$ $1: 4)$ afforded $153(3.99 \mathrm{~g}, 24.3 \mathrm{mmol}, 97 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta=2.71(\mathrm{td}, \mathrm{J}=$ $6.25,1.95 \mathrm{~Hz}, 2 \mathrm{H}), 3.82(\mathrm{t}, J=6.25 \mathrm{~Hz}, 2 \mathrm{H}), 4.54(\mathrm{~s}, 2 \mathrm{H}), 7.27-7.37(\mathrm{~m}, 5 \mathrm{H}), 9.80(\mathrm{t}, J=1.95 \mathrm{~Hz}, 1 \mathrm{H})$ ppm. ${ }^{13} \mathrm{C} \operatorname{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=43.8,63.7,73.1,127.6,127.7,128.3,137.8,201.1 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.49$ $(\mathrm{EtOAc} / n$-hexane $=1: 4)$.

2-(1-Benzyloxyethyl)-6-(2-benzyloxyethyl)-3,5-dimethyltetrahydropyran-4-one 155: To a solution of diene 146 ( $693 \mathrm{mg}, 2.00 \mathrm{mmol}$ ) and 3-benzyloxypropanal ( $153,394 \mathrm{mg}, 2.40 \mathrm{mmol}$ ) in $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{ml})$ was added at $-30^{\circ} \mathrm{C} \mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}(304 \mu \mathrm{l}, 341 \mathrm{mg}, 2.40 \mathrm{mmol})$. The mixture was stirred for 5 h between $-30^{\circ} \mathrm{C}$ and $-15^{\circ} \mathrm{C} . \mathrm{Et}_{3} \mathrm{~N}(665 \mu \mathrm{l}, 486 \mathrm{mg}, 4.80 \mathrm{mmol})$ was added, the mixture was diluted with $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{ml})$ and sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{ml})$, and extracted with $t \mathrm{BuOMe}(3 \times 100 \mathrm{ml})$. The combined organic fractions were dried
$\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo to give the crude diastereomeric mixture of HDA product 154. To a solution of crude silyl enol ether 154 (max. 2.00 mmol ) in THF ( 20 ml ) was added acetic acid ( $286 \mu \mathrm{l}$, $300 \mathrm{mg}, 5.00 \mathrm{mmol})$ followed by $\mathrm{TBAF} \cdot 3 \mathrm{H}_{2} \mathrm{O}(947 \mathrm{mg}, 3.00 \mathrm{mmol})$ and the mixture was stirred overnight at rt . The mixture was diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 100 \mathrm{ml})$. The combined organic fractions were washed with sat. aq. $\mathrm{NaHCO}_{3}(100 \mathrm{ml})$ and brine $(100 \mathrm{ml})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The residue was purified by flash chromatography (column dimensions: $35 \times 2.5 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 8)$ to give four diastereomeric products (155a-d) in a 14:66:8:12 ratio (the latter two, 155c and 155d, being inseparable; their configurations could not be determined) in a total yield of 647 mg ( $1.63 \mathrm{mmol}, 82 \%$ over two steps). The former isomer (155a) was determined to have the $(3 x, 5 x)$ configuration, and may be derived (at least partially) from the $E$-diene. The configuration of major product 155b could not be determined unequivocally. Isomer 155a: ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right): \delta$ $=0.98(\mathrm{~d}, J=6.64 \mathrm{~Hz}, 3 \mathrm{H}), 1.05(\mathrm{~d}, J=7.02 \mathrm{~Hz}, 3 \mathrm{H}), 1.27(\mathrm{~d}, J=5.85 \mathrm{~Hz}, 3 \mathrm{H}), 1.79(\mathrm{ddt}, J=14.44,9.76$, $5.07 \mathrm{~Hz}, 1 \mathrm{H}), 2.08(\mathrm{dtd}, J=14.44,7.42,2.34 \mathrm{~Hz}, 1 \mathrm{H}), 2.46(\mathrm{dq}, J=10.54,6.64 \mathrm{~Hz}, 1 \mathrm{H}), 2.83(\mathrm{qd}, J=7.03$, $2.34 \mathrm{~Hz}, 1 \mathrm{H}), 3.37(\mathrm{ddd}, J=10.54,9.76,2.34 \mathrm{~Hz}, 1 \mathrm{H}), 3.38(\mathrm{dd}, J=8.59,2.34 \mathrm{~Hz}, 1 \mathrm{H}), 3.59(\mathrm{dq}, J=8.59$, $5.85 \mathrm{~Hz}, 1 \mathrm{H}), 3.67(\mathrm{dd}, J=7.42,5.07 \mathrm{~Hz}, 2 \mathrm{H}), 4.36(\mathrm{~d}, J=11.70 \mathrm{~Hz}, 1 \mathrm{H}), 4.49(\mathrm{~d}, J=12.10 \mathrm{~Hz}, 1 \mathrm{H}), 4.53$ $(\mathrm{d}, J=11.71 \mathrm{~Hz}, 1 \mathrm{H}), 4.65(\mathrm{~d}, J=11.71 \mathrm{~Hz}, 1 \mathrm{H}), 7.27-7.36,(\mathrm{~m}, 10 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 125 \mathrm{MHz}\right):$ $\delta=9.2,11.4,16.7,34.5,46.1,46.3,66.6,70.4,72.6,73.2,80.3,82.0,127.63,127.64,127.67,128.39$, $128.40,138.1,138.3,212.7 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.67(\mathrm{EtOAc} / n-$ hexane $=1: 4)$. Isomer 155b: ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 400\right.$ $\mathrm{MHz}): \delta=0.97(J=6.63 \mathrm{~Hz}, 3 \mathrm{H}), 1.13(\mathrm{~d}, J=7.03 \mathrm{~Hz}, 3 \mathrm{H}), 1.30(\mathrm{~d}, J=6.63 \mathrm{~Hz}, 3 \mathrm{H}), 1.67-1.74(\mathrm{~m}, 1 \mathrm{H})$, $1.94-2.01(\mathrm{~m}, 1 \mathrm{H}), 2.43(\mathrm{qd}, J=7.03,2.34 \mathrm{~Hz}, 1 \mathrm{H}), 2.52(\mathrm{dq}, J=10.54,6.64 \mathrm{~Hz}, 1 \mathrm{H}), 3.42(\mathrm{dd}, J=10.53$, $2.34 \mathrm{~Hz}, 1 \mathrm{H}), 3.57-3.70(\mathrm{~m}, 3 \mathrm{H}), 3.81(\mathrm{ddd}, J=8.58,4.29,2.34 \mathrm{~Hz}, 1 \mathrm{H}), 4.48(\mathrm{~s}, 2 \mathrm{H}), 4.55(\mathrm{~d}, J=12.10$ $\mathrm{Hz}, 1 \mathrm{H}), 4.59(\mathrm{~d}, J=12.10 \mathrm{~Hz}, 1 \mathrm{H}), 7.28-7.35(\mathrm{~m}, 10 \mathrm{H}) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.57(\mathrm{EtOAc} / n$-hexane $=1: 4)$.

2-(1-Benzyloxyethyl)-6-(2-benzyloxyethyl)-3,5-dimethyltetrahydropyran-4-ol 156: To a solution of ketone 155b (198 mg, 0.50 mmol$)$ in $\mathrm{MeOH}(10 \mathrm{ml})$ was added at $0^{\circ} \mathrm{C} \mathrm{NaBH}_{4}(37 \mathrm{mg}, 1.00 \mathrm{mmol})$ and the mixture was stirred for 1 h at $0^{\circ} \mathrm{C}$. The mixture was quenched by addition of sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(10 \mathrm{ml})$, diluted with brine $(50 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 30 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo to give $156(144 \mathrm{mg}, 0.36 \mathrm{mmol}, 72 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.89(\mathrm{~d}, J=7.02 \mathrm{~Hz}, 3 \mathrm{H}), 0.91(\mathrm{~d}, J=7.03 \mathrm{~Hz}, 3 \mathrm{H}), 1.28(\mathrm{~d}, J=5.86 \mathrm{~Hz}$, $3 \mathrm{H}), 1.63-1.71(\mathrm{~m}, 1 \mathrm{H}), 1.81-1.92(\mathrm{~m}, 2 \mathrm{H}), 2.30(\mathrm{~m}, 1 \mathrm{H}), 3.16(\mathrm{dd}, J=9.37,2.34 \mathrm{~Hz}, 1 \mathrm{H}), 3.44-3.64(\mathrm{~m}$, $4 \mathrm{H}), 3.91(\mathrm{td}, J=5.07,4.69 \mathrm{~Hz}, 1 \mathrm{H}), 4.36(\mathrm{~d}, J=10.93 \mathrm{~Hz}, 1 \mathrm{H}), 4.48(\mathrm{~d}, J=11.71 \mathrm{~Hz}, 1 \mathrm{H}), 4.53(\mathrm{~d}, J=$ $12.10 \mathrm{~Hz}, 1 \mathrm{H}), 4.66(\mathrm{~d}, J=11.31 \mathrm{~Hz}, 1 \mathrm{H}), 7.28-7.37(\mathrm{~m}, 10 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=8.3$, $8.4,16.9,32.9,35.3,38.6,67.2,70.6,73.0,73.2,73.5,76.7,83.0,127.6$ (2C), 127.66 (2C), 127.67 (2C), 128.31 (2C), 128.34 (2C), 138.29, 138.32 ppm .

## fragment

## 3 Synthesis of the ratjadone analogue B fragment

### 3.1 Retrosynthesis

The substituted THP and dihydro- $\alpha$-pyrone ring systems of ratjadone are connected by a linear tetraene chain with methyl substituents at various positions. Radioactive labeling studies showed that this chain (like the rest of the molecule) is derived from polyketide metabolism (acetate and propionate residues). ${ }^{1}$ However, we recognized that this segment of ratjadone also resembles linear terpenoids, such as geraniol 157, nerol 158, and farnesol 159. These compounds are derived from isoprenoid metabolism and formed from head/tail coupling of the basic building blocks dimethylallyl pyrophosphate (DMAPP) 160 and isopentenyl pyrophosphate (IPP) 161, and are available from natural sources in large quantities.

Figure 3.1. DMAPP, IPP, and simple linear isoprenoids.

The incorporation of e.g. geraniol into ratjadone analogues would contribute ten of the total number of twenty-eight carbon atoms of the ratjadone skeleton, and is therefore highly desirable from an atom economy point of view.

In order to construct a building block that can serve as a connection between the other two fragments, functionalization of e.g. a geraniol derivative at the terminal E-methyl group is required. Although many selective allylic oxidation methods are known, only the $\mathrm{SeO}_{2}$ oxidation (and its catalytic variations) selectively functionalize terminal $E$-methyl groups, and only when the $Z$ substituent is not larger than a methyl group. This chemo- and regioselectivity is inherent to the mechanism of the reaction (Fig. 3.2). ${ }^{2}$

Figure 3.2. Mechanism of the $\mathrm{SeO}_{2}$ oxidation.

Since the stoichiometric version of the $\mathrm{SeO}_{2}$ oxidation suffers from complications such as the large amount of red selenium formed during the reaction and high toxicity of selenium compounds, it is often replaced (especially in large-scale procedures) by a catalytic version using a stoichiometric oxidant (typically $t \mathrm{BuOOH}$ ), which was first described by Sharpless and co-workers. ${ }^{3}$ Several procedures have been described in literature, varying in stoichiometry, reaction temperature and time, and additives. An efficient procedure has been developed in our group. ${ }^{4}$
A major drawback of this methodology is the fact that the reaction typically does not proceed to completion. Instead, there seems to be an optimum in the yield of the desired allylic alcohol. An increase in reaction time and/or temperature, or the amount of stoichiometric oxidant or $\mathrm{SeO}_{2}$ does not result in an increase of the yield of the desired alcohol, but rather in formation of the corresponding aldehyde, which is only a minor side product under optimal conditions. A typical optimal yield of the desired alcohol is $50 \%$, the major part of the remainder being the starting material. Therefore, yields in literature reports are often based on recovered starting material. It should be mentioned that these problems have (at least partly) been overcome by using alternative selenium catalysts, which are, however, expensive and not yet commercially available.

### 3.2 Synthesis

We performed the catalytic $\mathrm{SeO}_{2}$ oxidation using several protected geraniol and nerol derivatives 162-168. The yield is not only dependent on reaction conditions, but also on the nature of the protective group. The yield of the reaction seems to increase with the polarity of the protective group, ranging from $11 \%$ for geranyl TBS ether to $54 \% ~(42 \%$ alcohol + $12 \%$ aldehyde) for geranyl acetate. The reason for this observation is unclear. The reaction also proceeds quite well with THP-protected geraniol or nerol, but later selective cleavage of the THP ether in the presence of other protective groups such as Ac or TBS proved troublesome.

Scheme 3.1. (a) $\mathrm{Ac}_{2} \mathrm{O}$, py, $87 \%$ from 158, quant. from 157; (b) cat. $\mathrm{SeO}_{2}$, tBuOOH, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 11-54 \%$ (see text and Experimental section); (c) DHP, cat. PPTS, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, quant. for 165, quant. for 166; (d) TBSCl, imidazole, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 100 \%$ from 157, $99 \%$ from 164, $89 \%$ from 165; (e) TESCl, imidazole, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, quant.; (f) $\mathrm{LiAlH}_{4}$, THF, $0^{\circ} \mathrm{C}, 100 \%$; (g) $\mathrm{K}_{2} \mathrm{CO}_{3}$, MeOH, $68 \%$ for 166, $94 \%$ for $\mathbf{1 6 8}$; (h) $\mathrm{MgBr}_{2} \cdot \mathrm{Et}_{2} \mathrm{O}, \mathrm{Et}_{2} \mathrm{O}, 37 \%$ (+ 14\% starting material).

For example, treatment of the $\omega$-OTBS ether of 165 with various Lewis acids $\left(\mathrm{LiBr}, \mathrm{ZnBr}_{2}\right.$, $\mathrm{SnCl}_{2}$ ) in MeOH or $\mathrm{Et}_{2} \mathrm{O}$ or PPTS in MeOH led either to no reaction, simultaneous cleavage of both protective groups or decomposition. Only reaction with $\mathrm{MgBr}_{2} \cdot \mathrm{Et}_{2} \mathrm{O}$ led to selective cleavage of the THP ether to give 165, albeit in poor yield ( $37 \%$, along with $14 \%$
starting material). Thus, a number of monoprotected $\omega$-hydroxylated geraniol and nerol derivatives were synthesized using standard reaction conditions.

Since the terpenoid building blocks were to be connected to the other fragments by Wittig reaction with the phosphonium salt functionality being part of the terpenoid building block, the free alcohol was required to be transformed into a leaving group. Literature often reports the use of Appel-type reactions ${ }^{5,6}$ or bromide displacement of mesylates ${ }^{7}$ to generate bromides in similar cases, we chose to employ the corresponding chlorides. Studies in our group have shown that such allylic chlorides are sufficiently electrophilic to be displaced by nucleophilic phosphines such as tri- $n$-butylphosphine. The advantage of such chlorides over the corresponding bromides lies mainly in their higher stability. They are stable under flash chromatography conditions and therefore can be obtained in pure form; this is not possible for the corresponding bromides, which are, in addition, often contaminated by significant amounts of chloride. For these reasons, the chlorides can be analyzed unambiguously. Finally, the chlorides remain stable upon storage at $-20^{\circ} \mathrm{C}$ (decomposition takes place over weeks at room temperature), whereas the bromides are sometimes unstable.

Scheme 3.2. (a) $\mathrm{NCS}, \mathrm{Me}_{2} \mathrm{~S}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-78 \rightarrow-10^{\circ} \mathrm{C}, 37-77 \%$; (b) $\mathrm{PBu}_{3}, 70^{\circ} \mathrm{C}, 3 \mathrm{~h}$, no solvent, quant.

The Corey-Kim reaction ${ }^{8}$ proved to be an efficient and reliable method to generate the allylic chlorides. The functionalized allylic alcohols were converted to the corresponding chlorides in reasonable to excellent yields using this procedure. The allylic chlorides were
transformed into the corresponding tributylphosphonium salts by treatment with 1.0 eq. of tri-n-butylphosphine at $70^{\circ} \mathrm{C}$ fo 3 h (no solvent).

### 3.3 Conclusion

Despite its limitations, the catalytic selenium dioxide oxidation provides a unique possibility to rapidly generate $\alpha, \omega$-bifuctional terpenoids. The resulting alcohols are reliably transformed to the corresponding chlorides, which are stable, isolable compounds. Treatment with tributylphosphine affords the phosphonium salts required for connection to the other segments quantitatively.

### 3.4 Experimental section

General. All commercial reagents were purchased from Fluka, Merck or Aldrich and used without further purification, unless otherwise stated. All oxygen- and water-sensitive reactions were carried out in ovendried glassware under argon. THF was distilled from potassium/benzophenone ketyl, $\mathrm{Et}_{2} \mathrm{O}$ was distilled from sodium/potassium/benzophenone ketyl, and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was distilled from calcium hydride. Other dry solvents were purchased from Fluka. Flash chromatography was performed using silica gel 60 (230-400 mesh, Merck). Thin-layer chromatography (TLC) was performed using silica plates (Merck, silica gel 60 $\mathrm{F}_{254}$ ) and developed using Cer-MOP reagent [molybdatophosphoric acid ( 5.0 g ), cerium (IV) sulfate ( 2.0 g ), and concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}(16 \mathrm{ml})$ in water $\left.(200 \mathrm{ml})\right]$. Optical rotations were measured using a 1 ml cell with 1 dm path length on a Jasco DIP-1000 digital polarimeter. IR spectra were recorded as $\mathrm{CHCl}_{3}$ solutions or as thin films between NaCl plates on a Bruker IFS $28 .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded in $\mathrm{CDCl}_{3}$ on Varian Mercury VX 300 and VX 400 spectrometers using TMS as internal standard. Chemical shifts $\delta$ are reported in parts per million (ppm), coupling constants $J$ are given in Hertz ( Hz ). High resolution ESI mass spectra were obtained from a Bruker Apex 70e Fourier transform ion cyclotron resonance mass spectrometer equipped with a 7.0 Tesla superconducting magnet and an external electrospray ion source (Agilent, off axis spray).

10-Hydroxyneryl acetate 162: To a cooled $\left(0^{\circ} \mathrm{C}\right)$ mixture of pyridine ( $16.1 \mathrm{ml}, 15.8 \mathrm{~g}, 200 \mathrm{mmol}$ ) and acetic anhydride ( $16.1 \mathrm{ml}, 17.5 \mathrm{~g}, 170 \mathrm{mmol}$ ) was added nerol $(15.4 \mathrm{~g}, 100 \mathrm{mmol})$. The mixture was stirred for 2 h at $0^{\circ} \mathrm{C}$, diluted with EtOAc $(100 \mathrm{ml})$, and washed with 1 N aq. $\mathrm{HCl}(2 \times 50 \mathrm{ml}), \mathrm{H}_{2} \mathrm{O}(2 \times 50 \mathrm{ml})$, and
brine ( 50 ml ). The organic fraction was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo, giving 162a $(17.0 \mathrm{~g}, 86.6 \mathrm{mmol}, 87 \%)$ as a colorless oil that was used in the next step without further purification. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta=1.60(\mathrm{~s}, 3 \mathrm{H}), 1.68(\mathrm{~s}, 3 \mathrm{H}), 1.77(\mathrm{~d}, J=1.18 \mathrm{~Hz}, 3 \mathrm{H}), 2.06-2.14(\mathrm{~m}, 4 \mathrm{H}), 4.55$ (dd, $J=7.33,0.59 \mathrm{~Hz}, 2 \mathrm{H}), 5.09(\mathrm{tq}, J=5.57,1.47 \mathrm{~Hz}, 1 \mathrm{H}), 5.36(\mathrm{t}, J=7.33 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm}$. A mixture of neryl acetate (162a, $17.0 \mathrm{~g}, 86.6 \mathrm{mmol}$ ), $\mathrm{SeO}_{2}(2.41 \mathrm{~g}, 21.8 \mathrm{mmol}), 70 \%$ aq. $t \mathrm{BuOOH}(12.3 \mathrm{ml}, 93.5 \mathrm{mmol})$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(150 \mathrm{ml})$ was stirred for 2 h at $0^{\circ} \mathrm{C}$. The solvent was removed in vacuo, and toluene $(100 \mathrm{ml})$ was added and removed in vacuo. This process was repeated three times in order to remove excess $t \mathrm{BuOOH}$. The residue was purified by flash chromatography (column dimensions: $30 \times 4 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=$ $1: 4 \rightarrow 1: 2)$ to give $\mathbf{1 6 2}(4.14 \mathrm{~g}, 19.5 \mathrm{mmol}, 23 \%)$ as a colorless oil, accompanied by the starting material $(10.8 \mathrm{~g}, 55.1 \mathrm{mmol})$. The yield based on recovered starting material is therefore $65 \%$. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200\right.$ $\mathrm{MHz}): \delta=1.65(\mathrm{~s}, 3 \mathrm{H}), 1.75(\mathrm{~d}, J=1.01 \mathrm{~Hz}, 3 \mathrm{H}), 2.03(\mathrm{~s}, 3 \mathrm{H}), 2.12-2.14(\mathrm{~m}, 4 \mathrm{H}), 3.97(\mathrm{~s}, 2 \mathrm{H}), 4.55(\mathrm{~d}, J=$ $7.18 \mathrm{~Hz}, 1 \mathrm{H}), 5.30-5.37(\mathrm{~m}, 2 \mathrm{H}) \mathrm{ppm}$.
tert-Butyldimethylsilyl 10-hydroxygeranyl ether 163: To a solution of imidazole ( $1.56 \mathrm{~g}, 23.3 \mathrm{mmol}$ ) and geraniol ( $3.27 \mathrm{~g}, 21.2 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(25 \mathrm{ml})$ was added at $0^{\circ} \mathrm{C} \operatorname{TBSCl}(3.35 \mathrm{~g}, 22.2 \mathrm{mmol})$. The mixture was stirred 2 h at rt , diluted with sat aq. $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{ml})$, and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 50 \mathrm{ml})$. The organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo, giving TBS geranyl ether (163a, 5.67 g , $21.1 \mathrm{mmol}, 100 \%$ ) as a colorless oil that was pure as judged by ${ }^{1} \mathrm{H}$ NMR and used in the next step without further purification. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.07(\mathrm{~s}, 6 \mathrm{H}), 0.91(\mathrm{~s}, 9 \mathrm{H}), 1.60(\mathrm{~s}, 3 \mathrm{H}), 1.62(\mathrm{~s}, 3 \mathrm{H})$, $1.68(\mathrm{~d}, J=0.78 \mathrm{~Hz}, 3 \mathrm{H}), 2.00-2.02(\mathrm{~m}, 2 \mathrm{H}), 2.08-2.10(\mathrm{~m}, 2 \mathrm{H}), 4.19(\mathrm{~d}, J=5.86 \mathrm{~Hz}, 2 \mathrm{H}), 5.09(\mathrm{tdd}, J=$ $7.03,1.56,1.17 \mathrm{~Hz}, 1 \mathrm{H}), 5.30(\mathrm{tt}, J=6.64,1.17 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm}$. A mixture of $\mathrm{SeO}_{2}(117 \mathrm{mg}, 1.05 \mathrm{mmol})$, $70 \%$ aq. $t \mathrm{BuOOH}(7.79 \mathrm{ml}, 59.2 \mathrm{mmol})$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{ml})$ was stirred for 40 min at rt . Then, TBS geranyl ether ( $163 \mathrm{a}, 5.67 \mathrm{~g}, 21.1 \mathrm{mmol}$ ) was added and the mixture was stirred for 24 h at rt . The solvent was removed in vacuo, and toluene ( 25 ml ) was added and removed in vacuo. This process was repeated three times in order to remove excess $t \mathrm{BuOOH}$. The residue was purified by flash chromatography (column dimensions: $25 \times 3.5 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 10)$ to give $163(659 \mathrm{mg}, 2.32 \mathrm{mmol}, 11 \%)$ as a colorless oil, as well as a significant amount of unreacted starting material. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.07(\mathrm{~s}, 6 \mathrm{H})$, $0.91(\mathrm{~s}, 9 \mathrm{H}), 1.63(\mathrm{~s}, 3 \mathrm{H}), 1.67(\mathrm{~s}, 3 \mathrm{H}), 2.03-2.06(\mathrm{~m}, 2 \mathrm{H}), 2.13-2.19(\mathrm{~m}, 2 \mathrm{H}), 3.99(\mathrm{~d}, \mathrm{~J}=4.68 \mathrm{~Hz}, 2 \mathrm{H})$, $4.19(\mathrm{~d}, J=6.25 \mathrm{~Hz}, 2 \mathrm{H}), 5.30(\mathrm{td}, J=6.24,1.17 \mathrm{~Hz}, 1 \mathrm{H}), 5.38(\mathrm{td}, J=7.03,1.17 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm}$.

10-Hydroxygeranyl acetate 164: To a cooled $\left(0^{\circ} \mathrm{C}\right)$ mixture of pyridine ( $8.05 \mathrm{ml}, 7.91 \mathrm{~g}, 100 \mathrm{mmol}$ ) and acetic anhydride $(8.03 \mathrm{ml}, 8.73 \mathrm{~g}, \mathrm{mmol})$ was added geraniol $(8.77 \mathrm{ml}, 7.71 \mathrm{~g}, 50 \mathrm{mmol})$. The mixture was stirred for 2 h at $0^{\circ} \mathrm{C}$ and poured into ice water $(200 \mathrm{ml})$. The mixture was extracted with EtOAc $(3 \times 100$ $\mathrm{ml})$. The combined organic fractions were washed with 1 N aq. $\mathrm{HCl}(2 \times 100 \mathrm{ml}), \mathrm{H}_{2} \mathrm{O}(2 \times 100 \mathrm{ml})$, and brine $(100 \mathrm{ml})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo, giving 164 a ( 9.99 g , quant.) as a
colorless oil that was used in the next step without further purification. $\mathrm{R}_{\mathrm{f}}=0.80(\mathrm{EtOAc} / n /$ hexane $=1: 4) \mathrm{A}$ mixture of $\mathrm{SeO}_{2}(277 \mathrm{mg}, 2.5 \mathrm{mmol}), 70 \%$ aq. $t \mathrm{BuOOH}(18.5 \mathrm{ml}, 140 \mathrm{mmol})$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(75 \mathrm{ml})$ was stirred for 30 min at rt . Then, geranyl acetate (164a, max. 50 mmol ) was added and the mixture was stirred for 24 h at rt . The solvent was removed in vacuo, and toluene ( 50 ml ) was added and removed in vacuo. This process was repeated three times in order to remove excess $t \mathrm{BuOOH}$. The residue was purified by flash chromatography (column dimensions: $28 \times 4 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 4 \rightarrow 1: 2$ ) to give $\mathbf{1 6 4}(4.41 \mathrm{~g}, 20.8$ mmol, $42 \%$ over two steps) as a colorless oil, accompanied by the corresponding aldehyde ( $1.22 \mathrm{~g}, 5.81$ $\mathrm{mmol}, 12 \%) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=1.38(\mathrm{bs}, 1 \mathrm{H}, \mathrm{OH}), 1.67(\mathrm{~s}, 3 \mathrm{H}), 1.71(\mathrm{~s}, 3 \mathrm{H}), 2.06(\mathrm{~s}, 3 \mathrm{H})$, $2.10(\mathrm{dd}, J=7.42,7.03 \mathrm{~Hz}, 2 \mathrm{H}), 2.18(\mathrm{dt}, J=7.42,7.02 \mathrm{~Hz}, 2 \mathrm{H}), 4.00(\mathrm{~s}, 2 \mathrm{H}), 4.59(\mathrm{~d}, J=7.03 \mathrm{~Hz}, 2 \mathrm{H})$, $5.34(\mathrm{td}, J=7.03,1.17 \mathrm{~Hz}, 1 \mathrm{H}), 5.37(\mathrm{t}, J=7.03 \mathrm{~Hz}) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.22(\mathrm{EtOAc} / n-$ hexane $=1: 3)$.

10-Hydroxygeranyl THP ether 165: To a mixture of geraniol ( $87 \mathrm{ml}, 77.1 \mathrm{~g}, 500 \mathrm{mmol}$ ) and DHP ( 50 ml , $46.3 \mathrm{~g}, 550 \mathrm{mmol})$ was added $\mathrm{AlCl}_{3} \cdot \mathrm{H}_{2} \mathrm{O}(1.21 \mathrm{~g}, 5.00 \mathrm{mmol})$. The mixture was stirred 5 h at rt , eluted over a short silica column with $\mathrm{EtOAc} / \mathrm{PE}=1: 10$ and concentrated in vacuo, giving geranyl THP ether (165a) in quantitative yield, as a colorless oil that was pure as judged by ${ }^{1} \mathrm{H}$ NMR and used in the next step without further purification. A mixture of $\mathrm{SeO}_{2}(1.55 \mathrm{~g}, 14.0 \mathrm{mmol}), 70 \%$ aq. $t \mathrm{BuOOH}(79 \mathrm{ml}, 600 \mathrm{mmol})$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(500 \mathrm{ml})$ was stirred for 30 min at rt . Then, geranyl THP ether ( $\mathbf{1 6 5 a}, 47.7 \mathrm{~g}, 200 \mathrm{mmol}$ ) was added and the mixture was stirred for 24 h at rt . Toluene $(120 \mathrm{ml})$ was added and the solvent was removed in vacuo. The residue was taken in $\mathrm{Et}_{2} \mathrm{O}(300 \mathrm{ml})$, washed with $0.2 \mathrm{~N} \mathrm{NaOH}(3 \times 100 \mathrm{ml})$, and brine $(150 \mathrm{ml})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The residue was purified by flash chromatography (column dimensions: $25 \times 6 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 10)$ to give $165(13.3 \mathrm{~g}, 52.4 \mathrm{mmol}, 26 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=1.48-1.85(\mathrm{~m}, 6 \mathrm{H}), 1.67(\mathrm{~s}, 3 \mathrm{H}), 1.68(\mathrm{~s}, 3 \mathrm{H}), 2.05-2.10(\mathrm{~m}, 2 \mathrm{H}), 2.15-$ $2.19(\mathrm{~m}, 2 \mathrm{H}), 3.49-3.54(\mathrm{~m}, 1 \mathrm{H}), 3.86-3.92(\mathrm{~m}, 1 \mathrm{H}), 3.99(\mathrm{~s}, 2 \mathrm{H}), 4.02(\mathrm{dd}, J=11.71,7.42 \mathrm{~Hz}, 1 \mathrm{H}), 4.24$ $(\mathrm{dd}, J=11.71,6.64 \mathrm{~Hz}, 1 \mathrm{H}), 5.35(\mathrm{ddd}, J=7.41,6.64,1.17 \mathrm{~Hz}, 1 \mathrm{H}), 5.37(\mathrm{td}, J=6.64,1.17 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm}$. ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=13.8,16.4,19.6,25.5,25.8,30.7,39.2,62.2,63.6,68.8,97.7,120.8$, 125.3, 134.9, 139.5 ppm .

10-(Tetrahydropyran-2-yl)oxygeraniol 166: To a solution of 10-hydroxygeranyl acetate (164, 5.80 g, $27.3 \mathrm{mmol})$ and PPTS $\cdot \mathrm{H}_{2} \mathrm{O}(690 \mathrm{mg}, 2.7 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(135 \mathrm{ml})$ was added DHP ( 4.63 g , 55.0 $\mathrm{mmol})$.The mixture was stirred for 5 h at rt , diluted with $\mathrm{Et}_{2} \mathrm{O}(200 \mathrm{ml})$, washed with brine ( 125 ml ), dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated in vacuo to give crude $\mathbf{1 6 6 a}(8.25 \mathrm{~g}, 27.8 \mathrm{mmol}$, quant.) that was pure as judged by TLC and ${ }^{1} \mathrm{H}$ NMR and used in the next step without further purification. $\mathrm{K}_{2} \mathrm{CO}_{3}(459 \mathrm{mg}, 3.32$ mmol ), was added at rt to a solution of 10-(tetrahydropyran-2-yl)oxygeranyl acetate (166a, $4.76 \mathrm{~g}, 16.6$ $\mathrm{mmol})$ in $\mathrm{MeOH}(10 \mathrm{ml})$ and the mixture was stirred overnight at rt . The mixture was diluted with EtOAc $(250 \mathrm{ml})$ and washed with 1 N aq. $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{ml}), \mathrm{H}_{2} \mathrm{O}(100 \mathrm{ml})$, and brine $(100 \mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$,
filtered and concentrated in vacuo. The residue was purified by flash chromatography (column dimensions $25 \times 4 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 4)$ to give $166(2.88 \mathrm{~g}, 11.32 \mathrm{mmol}, 68 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $200 \mathrm{MHz}): \delta=1.34-1.77(\mathrm{~m}, 6 \mathrm{H}), 1.46(\mathrm{~s}, 2 \times 3 \mathrm{H}), 1.83-2.00(\mathrm{~m}, 4 \mathrm{H}), 2.86(\mathrm{bs}, 1 \mathrm{H}, \mathrm{OH}), 3.22-3.33(\mathrm{~m}$, $1 \mathrm{H})$, 3.61-3.72 (m, 2H), 3.86-3.93 (m, 3H), 5.12-5.20(m, 2H) ppm. ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 50 \mathrm{MHz}\right): \delta=13.5$, $15.6,18.9,24.9,25.4,38.6,58.4,61.4,72.3,96.5,123.9,127.2,131.5,137.4 \mathrm{ppm}$.

10-Triethylsilyloxygeraniol 167: Triethylsilyl chloride $(9.23 \mathrm{ml}, 8.29 \mathrm{~g}, 55.0 \mathrm{mmol})$ was added in at $0^{\circ} \mathrm{C}$ to a solution of 10 -hydroxygeranyl acetate $(164,10.61 \mathrm{~g}, 50.0 \mathrm{mmol})$ and imidazole $(4.43 \mathrm{~g}, 65.0 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(250 \mathrm{ml})$ and the mixture was stirred for 2 h at rt . After dilution with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(250 \mathrm{ml})$, the mixture was washed with $\mathrm{H}_{2} \mathrm{O}(200 \mathrm{ml})$, sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(200 \mathrm{ml})$ and brine $(250 \mathrm{ml})$. The organic fraction was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo, affording 167 a ( 16.9 g , quant.) as a colorless oil that was used in the next step without further purification. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.61(\mathrm{q}, J=8.00 \mathrm{~Hz}$, $6 \mathrm{H}), 0.96(\mathrm{t}, \mathrm{J}=8.00 \mathrm{~Hz}, 9 \mathrm{H}), 1.61(\mathrm{~s}, 3 \mathrm{H}), 1.71(\mathrm{~s}, 3 \mathrm{H}), 2.06(\mathrm{~s}, 3 \mathrm{H}), 2.09(\mathrm{~m}, 2 \mathrm{H}), 2.16(\mathrm{~m}, 2 \mathrm{H}), 4.00(\mathrm{~s}$, $2 \mathrm{H}), 4.59(\mathrm{~d}, J=7.03 \mathrm{~Hz}, 2 \mathrm{H}), 5.37(\mathrm{~m}, 2 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=4.4,6.7,13.4,16.4$, $21.0,25.7,39.1,61.3,68.2,118.3,123.8,134.7,142.0,171.1 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.80(\mathrm{EtOAc} / n /$ hexane $=1: 4)$. To a solution of $\mathbf{1 6 7 a}(\max .50 .0 \mathrm{mmol})$ in THF $(250 \mathrm{ml})$ was added at $0^{\circ} \mathrm{C} \mathrm{LiAlH}_{4}(1.88 \mathrm{~g}, 50.0 \mathrm{mmol})$ and the mixture was stirred for 10 min . at $0^{\circ} \mathrm{C}$. The mixture was diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(500 \mathrm{ml})$ and extracted with with $t \mathrm{BuOMe}(3 \times 300 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo to give crude $167(14.28 \mathrm{~g}, 50.2 \mathrm{mmol}, 100 \%$ over two steps) as a colorless oil that was pure as judged by TLC, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.59(\mathrm{q}, \mathrm{J}=7.81 \mathrm{~Hz}, 6 \mathrm{H})$, $0.95(\mathrm{t}, J=7.81 \mathrm{~Hz}, 9 \mathrm{H}), 1.60(\mathrm{~s}, 3 \mathrm{H}), 1.66(\mathrm{~s}, 3 \mathrm{H}), 1.93(\mathrm{bs}, 1 \mathrm{H}), 2.05(\mathrm{~m}, 2 \mathrm{H}), 2.15(\mathrm{~m}, 2 \mathrm{H}), 3.98(\mathrm{~s}, 2 \mathrm{H})$, $4.11(\mathrm{~d}, J=7.02 \mathrm{~Hz}, 2 \mathrm{H}), 5.37(\mathrm{~m}, 2 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=4.3,6.7,13.4,16.1,25.7$, $39.1,59.1,68.2,123.6,124.1,134.5,138.9 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.40(\mathrm{EtOAc} / n / \mathrm{hexane}=1: 4)$

10-tert-Butyldimethylsilyloxygeraniol 168: From 164: tert-Butyldimethylsilyl chloride (3.29 g, 21.8 mmol ) was added in one portion at $0^{\circ} \mathrm{C}$ to a solution of 10 -hydroxygeranyl acetate ( $\mathbf{1 6 4}, 4.41 \mathrm{~g}, 20.8 \mathrm{mmol}$ ) and imidazole $(1.56 \mathrm{~g}, 22.8 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{ml})$ and the mixture was stirred for 15 min . at rt . After dilution with sat aq. $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{ml})$ the phases were separated and the aqueous phase was extracted one more time with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{ml})$. The combined organic fractions were washed with brine ( 50 ml ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo, affording $168 \mathrm{a}(6.70 \mathrm{~g}, 20.5 \mathrm{mmol}, 99 \%)$ as a colorless oil that was used in the next step without further purification. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta=0.06(\mathrm{~s}, 6 \mathrm{H})$, $0.91(\mathrm{~s}, 9 \mathrm{H}), 1.59(\mathrm{~s}, 3 \mathrm{H}), 1.71(\mathrm{~s}, 3 \mathrm{H}), 2.06(\mathrm{~s}, 3 \mathrm{H}), 2.09(\mathrm{~m}, 2 \mathrm{H}), 2.15(\mathrm{~m}, 2 \mathrm{H}), 4.00(\mathrm{~s}, 2 \mathrm{H}), 4,58(\mathrm{~d}, \mathrm{~J}=$ $7.13 \mathrm{~Hz}, 2 \mathrm{H}), 5.35-5.36(\mathrm{~m}, 2 \mathrm{H}) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.77(\mathrm{EtOAc} / \mathrm{PE}=1: 4)$. To a solution of $\mathbf{1 6 8 a}(6.69 \mathrm{~g}, 20.5$ $\mathrm{mmol})$ in $\mathrm{MeOH}(150 \mathrm{ml})$ was added $\mathrm{K}_{2} \mathrm{CO}_{3}(567 \mathrm{mg}, 4.10 \mathrm{mmol})$ and the mixture was stirred for 45 min . at rt . The volume was reduced in vacuo and the mixture was diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{ml})$ and brine
$(200 \mathrm{ml})$ and extracted with with $t \mathrm{BuOMe}(3 \times 150 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo to give $168(5.51 \mathrm{~g}, 19.4 \mathrm{mmol}, 94 \%)$ as a colorless oil that was used in the next step without further purification.

From 165: tert-Butyldimethylsilyl chloride ( $791 \mathrm{mg}, 5.25 \mathrm{mmol}$ ) was added in one portion at $0^{\circ} \mathrm{C}$ to a solution of 10-hydroxygeranyl THP ether ( $\mathbf{1 6 5}, 1.27 \mathrm{~g}, 5.00 \mathrm{mmol}$ ) and imidazole ( $374 \mathrm{mg}, 5.50 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{ml})$ and the mixture was stirred for 2 h at $0^{\circ} \mathrm{C}$. After dilution with $t \mathrm{BuOMe}(50 \mathrm{ml})$, the mixture was washed with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(25 \mathrm{ml})$, sat. aq. $\mathrm{NaHCO}_{3}(25 \mathrm{ml})$ and brine $(25 \mathrm{ml})$. The organic fraction was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo, affording $\mathbf{1 6 8 b}(1.65 \mathrm{~g}, 4.47 \mathrm{mmol}, 89 \%)$ as a colorless oil that was used in the next step without further purification. ${ }^{1} \mathrm{H}$ NMR $(\mathrm{MHz}): \delta=0.06(\mathrm{~s}, 6 \mathrm{H})$, $0.91(\mathrm{~s}, 9 \mathrm{H}), 1.51-1.58(\mathrm{~m}, 4 \mathrm{H}), 1.59(\mathrm{~s}, 3 \mathrm{H}), 1.68(\mathrm{~s}, 3 \mathrm{H}), 1.70-1.76(\mathrm{~m}, 1 \mathrm{H}), 1.81-1.86(\mathrm{~m}, 1 \mathrm{H}), 2.07(\mathrm{~m}$, $2 \mathrm{H}), 2.16(\mathrm{~m}, 2 \mathrm{H}), 3.49-3.53(\mathrm{~m}, 1 \mathrm{H}), 3.86-3.92(\mathrm{~m}, 1 \mathrm{H}), 4.00(\mathrm{~s}, 2 \mathrm{H}), 4.02(\mathrm{dd}, J=12.10,7.42 \mathrm{~Hz}, 1 \mathrm{H})$, $4.24(\mathrm{dd}, J=12.10,6.64 \mathrm{~Hz}, 1 \mathrm{H}), 4.62(\mathrm{~m}, 1 \mathrm{H}), 5.35-5.38(\mathrm{~m}, 2 \mathrm{H}) \mathrm{ppm}$. To a solution of THP ether $\mathbf{1 6 8 b}$ $(737 \mathrm{mg}, 2.00 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(40 \mathrm{ml})$ was added $\mathrm{MgBr}_{2} \cdot \mathrm{Et}_{2} \mathrm{O}(1.55 \mathrm{~g}, 6.00 \mathrm{mmol})$ and the mixture was stirred overnight at rt . The mixture was diluted with sat. aq. $\mathrm{NaHCO}_{3}(100 \mathrm{ml})$ and extracted with with $t \mathrm{BuOMe}(3 \times 75 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography (column dimensions: $25 \times 2.5 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=$ 1:4) to give $168(211 \mathrm{mg}, 0.741 \mathrm{mmol}, 37 \%)$ as a colorless oil, accompanied by the starting material (107 $\mathrm{mg}, 0.29 \mathrm{mmol}, 14 \%) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta=0.06(\mathrm{~s}, 6 \mathrm{H}), 0.91(\mathrm{~s}, 9 \mathrm{H}), 1.59(\mathrm{~s}, 3 \mathrm{H}), 1.68(\mathrm{~s}$, $3 \mathrm{H}), 2.06(\mathrm{~m}, 2 \mathrm{H}), 2.15(\mathrm{~m}, 2 \mathrm{H}), 4.00(\mathrm{~s}, 2 \mathrm{H}), 4.15(\mathrm{~d}, J=5.85 \mathrm{~Hz}, 2 \mathrm{H}), 5,36(\mathrm{t}, J=5.85 \mathrm{~Hz}), 5.42(\mathrm{t}, J=$ $7.03 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right): \delta=-5.1,13.6,16.3,18.5,25.8,26.0,39.2,59.4,68.5$, $123.4,123.7,134.5,139.4 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.37(\mathrm{EtOAc} / \mathrm{PE}=1: 4) . \mathrm{R}_{\mathrm{f}}=0.16(\mathrm{EtOAc} / n-$ hexane $=1: 6)$.

10-Chloroneryl acetate 169: To a solution of NCS ( $421 \mathrm{mg}, 3.15 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{ml})$ was added at $-10^{\circ} \mathrm{C} \mathrm{Me}_{2} \mathrm{~S}(251 \mu \mathrm{l}, 214 \mathrm{mg}, 3.44 \mathrm{mmol})$. The mixture was stirred for 10 min . at $-10^{\circ} \mathrm{C}$, and the resulting white suspension was cooled to $-78^{\circ} \mathrm{C} .10$-Hydroxygeranyl acetate ( $\mathbf{1 6 2}, 608 \mathrm{mg}, 2.87 \mathrm{mmol}$ ) was added and the mixture was stirred for 1 h at $-10^{\circ} \mathrm{C}$. After dilution with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{ml})$, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 50 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography (column dimensions: $25 \times 2 \mathrm{~cm}$, $\mathrm{EtOAc} / \mathrm{PE}=1: 10)$ to give $169(415 \mathrm{mg}, 1.80 \mathrm{mmol}, 63 \%)$ as a colorless oil., ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right)$ : $\delta=1.74(\mathrm{~d}, J=0.88 \mathrm{~Hz}, 3 \mathrm{H}), 1.77(\mathrm{~s}, 3 \mathrm{H}), 2.05(\mathrm{~s}, 3 \mathrm{H}), 2.15-2.16(\mathrm{~m}, 4 \mathrm{H}), 4.01(\mathrm{~s}, 2 \mathrm{H}), 4.55(\mathrm{~d}, J=7.04$ $\mathrm{Hz}, 2 \mathrm{H}), 5.39(\mathrm{td}, J=7.03,1.17 \mathrm{~Hz}, 1 \mathrm{H}), 5.50(\mathrm{~m}, 1 \mathrm{H}) \mathrm{ppm}$.
tert-Butyldimethylsilyl 10-chlorogeranyl ether 170: To a solution of NCS ( $588 \mathrm{mg}, 4.40 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(25 \mathrm{ml})$ was added at $-10^{\circ} \mathrm{C} \mathrm{Me}_{2} \mathrm{~S}(351 \mu \mathrm{l}, 298 \mathrm{mg}, 4.80 \mathrm{mmol})$. The mixture was stirred for 10 min . at $-10^{\circ} \mathrm{C}$, and the resulting white suspension was cooled to $-78^{\circ} \mathrm{C}$. tert-Butyldimethylsilyl

10 -hydroxygeranyl ether $(163,1.14 \mathrm{~g}, 4.00 \mathrm{mmol})$ was added and the mixture was stirred for 1 h at $-10^{\circ} \mathrm{C}$. After dilution with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(20 \mathrm{ml})$ and $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{ml})$, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \times 75$ $\mathrm{ml})$ and $\mathrm{Et}_{2} \mathrm{O}(2 \times 75 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography (column dimensions: $25 \times 2 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=$ 1:40) to give $170(760 \mathrm{mg}, 2.51 \mathrm{mmol}, 63 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.08$ (s, $6 \mathrm{H}), 0.91(\mathrm{~s}, 9 \mathrm{H}), 1.63(\mathrm{~s}, 3 \mathrm{H}), 1.74(\mathrm{~d}, J=0.78 \mathrm{~Hz}, 3 \mathrm{H}), 2.03-2.07(\mathrm{~m}, 2 \mathrm{H}), 2.14-2.19(\mathrm{~m}, 2 \mathrm{H}), 4.00(\mathrm{~s}$, $2 \mathrm{H}), 4.19(\mathrm{~d}, J=6.24 \mathrm{~Hz}, 2 \mathrm{H}), 5.30(\mathrm{tt}, J=6.24,1.17 \mathrm{~Hz}, 1 \mathrm{H}), 5.51(\mathrm{t}, J=7.03 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=-4.9,14.2,16.4,18.5,26.1,26.3,38.7,52.5,60.3,124.7,130.2,131.6,135.9 \mathrm{ppm}$. $\mathrm{R}_{\mathrm{f}}=0.76(\mathrm{EtOAc} / \mathrm{PE}=1: 20)$.

10-Chlorogeranyl acetate 171: To a solution of $\mathrm{NCS}(586 \mathrm{mg}, 4.40 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(25 \mathrm{ml})$ was added at $-10^{\circ} \mathrm{C} \mathrm{Me}_{2} \mathrm{~S}(351 \mu \mathrm{l}, 298 \mathrm{mg}, 4.80 \mathrm{mmol})$. The mixture was stirred for 10 min . at $-10^{\circ} \mathrm{C}$, and the resulting white suspension was cooled to $-78^{\circ} \mathrm{C} .10$-Hydroxygeranyl acetate $(164,849 \mathrm{mg}, 4.00 \mathrm{mmol})$ was added and the mixture was stirred for 1 h at $-10^{\circ} \mathrm{C}$. After dilution with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(150 \mathrm{ml})$, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 100 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography (column dimensions: $25 \times 2.5$ $\mathrm{cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 15)$ to give $171(714 \mathrm{mg}, 3.09 \mathrm{mmol}, 77 \%)$ as a colorless oil._ ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400\right.$ $\mathrm{MHz}): \delta=1.71(\mathrm{~s}, 3 \mathrm{H}), 1.74(\mathrm{~s}, 3 \mathrm{H}), 2.06(\mathrm{~s}, 3 \mathrm{H}), 2.10(\mathrm{~m}, 2 \mathrm{H}), 2.17(\mathrm{~m}, 2 \mathrm{H}), 4.01(\mathrm{~s}, 2 \mathrm{H}), 4.59(\mathrm{~d}, \mathrm{~J}=$ $7.14 \mathrm{~Hz}, 2 \mathrm{H}), 5.34(\mathrm{~m}, 1 \mathrm{H}), 5.50(\mathrm{~m}, 1 \mathrm{H}) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.37(\mathrm{EtOAc} / n-$ hexane $=1: 10)$.

10-Chlorogeranyl tetrahydropyran-2-yl ether 172: To a solution of NCS ( $734 \mathrm{mg}, 5.50 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(25 \mathrm{ml})$ was added at $-10^{\circ} \mathrm{C} \mathrm{Me}_{2} \mathrm{~S}(439 \mu \mathrm{l}, 373 \mathrm{mg}, 6.00 \mathrm{mmol})$. The mixture was stirred for 10 min . at $-10^{\circ} \mathrm{C}$, and the resulting white suspension was cooled to $-78^{\circ} \mathrm{C} .10$-Hydroxygeranyl tetrahydropyran-2-yl ether $(165,1.27 \mathrm{~g}, 5.00 \mathrm{mmol})$ was added and the mixture was stirred for 1 h at $-10^{\circ} \mathrm{C}$. After dilution with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{ml})$, the phases were separated and the aqueoues phase was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 50$ $\mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography (column dimensions: $25 \times 3 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 20$ ) to give 172 ( 510 $\mathrm{mg}, 1.87 \mathrm{mmol}, 37 \%)$ as a colorless oil._ ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta=1.50-1.88(\mathrm{~m}, 6 \mathrm{H}), 1.68(\mathrm{~s}, 3 \mathrm{H})$, $1.73(\mathrm{~d}, J=0.73 \mathrm{~Hz}, 1 \mathrm{H}), 2.05-2.11(\mathrm{~m}, 2 \mathrm{H}), 2.15-2.22(\mathrm{~m}, 2 \mathrm{H}), 3.48(\mathrm{~m}, 1 \mathrm{H}), 3.86(\mathrm{~m}, 1 \mathrm{H}), 4.01(\mathrm{~s}, 2 \mathrm{H})$, $4.02(\mathrm{dd}, J=11.89,7.50 \mathrm{~Hz}, 1 \mathrm{H}), 4.24(\mathrm{dd}, J=11.89,7.32 \mathrm{~Hz}, 1 \mathrm{H}), 4.62(\mathrm{dd}, J=4.02,2.93 \mathrm{~Hz}, 1 \mathrm{H}), 5,37$ (ddd, $J=7.32,6.40,1.10 \mathrm{~Hz}, 1 \mathrm{H}), 5.51(\mathrm{t}, J=6.40 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm}$.

10-(Tetrahydropyran-2-yl)oxygeranyl chloride 173: To a solution of NCS ( $706 \mathrm{mg}, 5.29 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(25 \mathrm{ml})$ was added at $-10^{\circ} \mathrm{C} \mathrm{Me}_{2} \mathrm{~S}(422 \mu \mathrm{l}, 359 \mathrm{mg}, 5.77 \mathrm{mmol})$. The mixture was stirred for 10 min .
at $-10^{\circ} \mathrm{C}$, and the resulting white suspension was cooled to $-78^{\circ} \mathrm{C} .10$-(Tetrahydropyran-2-yl)oxygeraniol $(166,1.22 \mathrm{~g}, 4.81 \mathrm{mmol})$ was added and the mixture was stirred for 1 h at $-10^{\circ} \mathrm{C}$. After dilution with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{ml})$, the phases were separated and the aqueoues phase was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 50 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo to give crude 173 (1.24 $\mathrm{g}, 4.54 \mathrm{mmol}, 94 \%$ ) as a yellow oil. The product was purified by flash chromatography (column dimensions: $25 \times 3 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 20)$ to give $173(682 \mathrm{mg}, 2.50 \mathrm{mmol}, 52 \%)$ as a colorless oil._ ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta=1.51-1.94(\mathrm{~m}, 6 \mathrm{H}), 1.66(\mathrm{~s}, 3 \mathrm{H}), 1.73(\mathrm{~d}, J=1.17 \mathrm{~Hz}, 3 \mathrm{H}), 2.07-2.21(\mathrm{~m}, 4 \mathrm{H})$, $3.50(\mathrm{~m}, 1 \mathrm{H}), 3.82-3.91(\mathrm{~m}, 2 \mathrm{H}), 4.08-4.11(\mathrm{~m}, 3 \mathrm{H}), 4.60(\mathrm{dd}, J=3.82,2.93 \mathrm{~Hz}, 1 \mathrm{H}), 5.40(\mathrm{td}, J=7.04$, $1.17 \mathrm{~Hz}, 1 \mathrm{H}), 5.45(\mathrm{td}, J=8.21,1.17 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right): \delta=14.0,16.0,19.5,25.4$, $30.6,38.9,40.9,62.0,72.6,97.2,120.3,126.5,132.2,142.03 \mathrm{ppm}$.

10-Triethylsilyloxygeranyl chloride 174: To a solution of $\mathrm{NCS}(1.469 \mathrm{~g}, 11.0 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(100 \mathrm{ml})$ was added at $-10^{\circ} \mathrm{C} \mathrm{Me}_{2} \mathrm{~S}(877 \mu \mathrm{l}, 745 \mathrm{mg}, 12.0 \mathrm{mmol})$. The mixture was stirred for 10 min . at $-10^{\circ} \mathrm{C}$, and the resulting white suspension was cooled to $-78^{\circ} \mathrm{C} .10$-Triethylsilyloxygeraniol $(167,2.845 \mathrm{mg}, 10.0$ $\mathrm{mmol})$ was added and the mixture was stirred for 1 h at $-10^{\circ} \mathrm{C}$. After dilution with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(300 \mathrm{ml})$, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 200 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo to give crude $174(3.018 \mathrm{~g}, 9.96 \mathrm{mmol}, 100 \%)$ as a colorless oil. The product, which was estimated $\sim 90 \%$ pure by ${ }^{1} \mathrm{H}$ NMR, was used in the next step without further purification, since flash chromatography under various conditions resulted in significant loss of material. ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.61(\mathrm{q}, J=7.81 \mathrm{~Hz}, 6 \mathrm{H}), 0.96(\mathrm{t}, J=7.81 \mathrm{~Hz}, 9 \mathrm{H}), 1.61(\mathrm{~s}, 3 \mathrm{H}), 1.73(\mathrm{~s}$, $3 \mathrm{H}), 2.10(\mathrm{~m}, 2 \mathrm{H}), 2.16(\mathrm{~m}, 2 \mathrm{H}), 4.00(\mathrm{~s}, 2 \mathrm{H}), 4.10(\mathrm{~d}, \mathrm{~J}=7.80 \mathrm{~Hz}, 2 \mathrm{H}), 5.37(\mathrm{t}, \mathrm{J}=6.25 \mathrm{~Hz}, 1 \mathrm{H}), 5.45(\mathrm{t}$, $J=8.00 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=6.7,13.4,16.0,25.5,29.5,38.9,41.0,68.6,120.5$, $123.6,134.7,142.4 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.72(\mathrm{EtOAc} / n-$ hexane $=1: 6)$.

10-tert-Butyldimethylsilyloxygeranyl chloride 175: To a solution of NCS ( $105 \mathrm{mg}, 0.788 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{ml})$ was added at $-10^{\circ} \mathrm{C} \mathrm{Me}_{2} \mathrm{~S}(63 \mu \mathrm{l}, 53 \mathrm{mg}, 0.859 \mathrm{mmol})$. The mixture was stirred for 10 min . at $-10^{\circ} \mathrm{C}$, and the resulting white suspension was cooled to $-78^{\circ} \mathrm{C}$. 10-tert-Butyldimethylsilyloxygeraniol (168, $204 \mathrm{mg}, 0.716 \mathrm{mmol}$ ) was added and the mixture was stirred for 1 h at $-10^{\circ} \mathrm{C}$. After dilution with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(25 \mathrm{ml})$, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 25 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography (column dimensions: $25 \times 2 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 40$ ) to give $175(168 \mathrm{mg}, 0.555 \mathrm{mmol}, 77 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta=0.06(\mathrm{~s}, 6 \mathrm{H}), 0.91(\mathrm{~s}, 9 \mathrm{H}), 1.59(\mathrm{~s}, 3 \mathrm{H}), 1.73(\mathrm{~d}, J=1.28 \mathrm{~Hz}, 3 \mathrm{H})$, $2.09-2.17(\mathrm{~m}, 4 \mathrm{H}), 4.00(\mathrm{~s}, 2 \mathrm{H}), 4.10(\mathrm{~d}, J=8.05 \mathrm{~Hz}, 2 \mathrm{H}), 5.35(\mathrm{~m}, 1 \mathrm{H}), 5.45(\mathrm{td}, J=8.59,1.28 \mathrm{~Hz}, 1 \mathrm{H})$ ppm.

# Synthesis of the ratjadone analogue $C$ 

## fragment

## 4 Synthesis of the ratjadone analogue C fragment

### 4.1 Retrosynthesis

A suitable building block representing the C1-C6 fragment of ratjadone should be aldehyde 30, in which the sensitive lactone functionality is protected as an isopropyl acetal (Fig. 4.1). This is a known compound, employed in several total syntheses, including not only Kalesse's total synthesis of ratjadone, ${ }^{1,2}$ but also syntheses of callystatin $A^{3-6}$ and fostriecin ${ }^{7}$.

Figure 4.1. Ratjadone and its C ring building block 30.

The strategies employed to obtain compound $\mathbf{3 0}$ (or derivatives) are diverse, and include methods involving catalytic asymmetric hetero Diels-Alder reactions ${ }^{4}$, Brown asymmetric allylation and subsequent acrylation of the resulting alcohol followed by $\mathrm{RCM}^{8}$, and vinyl Grignard addition to a glycidol derivative followed by transacetalization and $\mathrm{RCM}^{3}$. Jacobsen and co-workers demonstrated that their chiral HDA catalyst can also be used to construct a similar compound. ${ }^{9}$ We chose to employ an eclectic approach, combining efficient literature procedures to achieve an optimal process.

### 4.2 Synthesis

Commercially available (tert-butyldimethylsilyloxy)acetaldehyde and 1-methoxy-1,3butadiene were subjected to a Jacobsen catalytic asymmetric HDA reaction, ${ }^{9}$ affording 183 in very good yield with only $0.5 \mathrm{~mol} \%$ of catalyst 83a, even in larger scale procedures. Subsequently, the equatorial methyl acetal was converted to the more stable axial isopropyl acetal. ${ }^{2}$ Interestingly, this axial isopropyl acetal is used as a protective group in nearly all syntheses of complex molecules carrying an $\alpha, \beta$-unsaturated $\delta$-lactone, even in cases where the lactone is formed. ${ }^{7}$ The reason for this is probably the sensitivity of this lactone moiety to both basic and acidic conditions, as well as its incompatibility with a variety of other reagents and conditions.

Scheme 4.1. (a) 83a ( $0.5 \mathrm{~mol} \%$ ), crushed $4 \AA$ mol. sieves, $88 \%$; (b) PPTS, $i$ PrOH; (c) TBAF, THF, $61 \%$ over two steps; (d) DMP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 96 \%$.

The inversion of the acetal was accompanied on some occasions with partial desilylation. This is not a problem, since the next reaction is the cleavage of the TBS ether under standard conditions (TBAF, THF). Because of concerns about possible partial epimerization at C5, the basic conditions of the Swern oxidation ${ }^{10}$ were deemed inappropriate for conversion to aldehyde 30. Instead, Dess-Martin oxidation ${ }^{11}$ was employed to obtain the required aldehyde $\mathbf{3 0}$ in excellent yield.

In preliminary studies, we attempted to use unprotected lactone 185. At this point in time, it was still unclear if this was a useful building block. Reports that avoid the use of the lactone and similar compounds as building blocks and use protected lactols instead are quite recent and were not available at the beginning of our study.

185
Figure 4.2. Unprotected C ring building block 185.

Commercially available (S)-glycidol was protected as a TBS ether. TBS ether 186 was treated with lithiated methyl propiolate at $-78^{\circ} \mathrm{C}$ in the presence of $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ to facilitate epoxide opening. It should be noted that in our hands none of the desired product was obtained when the literature procedure ${ }^{12}$ was followed (alkyne, then $n-\mathrm{BuLi}$, then $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$, then epoxide), whereas when the order of addition was changed to a more logical sequence (alkyne, then $n$ - BuLi , then epoxide, then $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ ), the desired product 187 was obtained in up to $88 \%$ yield (vs. $65 \%$ reported). Selective hydrogenation of the alkyne to the desired $Z$-alkene 188 was achieved with Lindlar catalyst in EtOAc. Ring closure to $\delta$ lactone 188 then proceeded smoothly by treatment with PPTS in refluxing benzene. Cleavage of the TBS ether was achieved by treatment with TBAF in the presence of AcOH.

Scheme 4.2. (a) TBSCl , imidazole, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 83 \%$; (b) methyl propiolate, $n$ - BuLi , $\mathrm{THF},-78^{\circ} \mathrm{C}$, then $\mathbf{1 8 6}$, then $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}, 84 \%$; (c) $\mathrm{H}_{2}$ (1 atm), Lindlar catalyst, EtOAc, $93 \%$; (d) PPTS, benzene, $\Delta, 85 \%$; (e) TBAF, $\mathrm{AcOH}, \mathrm{THF}, 57 \%$.

Thus, we were able to obtain (R)-6-hydroxymethyl-5,6-dihydro- $\alpha$-pyrone 190, but further conversion to aldehyde 185 was unsuccessful under various conditions (Swern, DessMartin). The apparent instability of this aldehyde is the probable reason that this compound is not used in any synthesis of a complex natural product. The only report of the use of this compound for a total synthesis is that of $(+)$-goniothalamin and $(-)$-argentilactone by Tsubuki et al., who generated the aldehyde in situ by Swern oxidation and used it immediately in the subsequent Wittig reaction. ${ }^{13}$ Even in this case, the yield did not exceed $37 \%$.

Boger and co-workers also attempted to use fragment 185 in their total synthesis of fostriecin. ${ }^{7}$ They were, however, not successful, and protected the lactone as an axial isopropyl acetal for further conversions. These findings indeed suggest that protection of such lactones is necessary for multistep syntheses, since the presence of the unprotected lactone is incompatible with a wide variety of conditions commonly used in organic synthesis. The only reported example of a synthesis where such a lactone is present in its unprotected form over a longer sequence of reactions is the elegant total synthesis of fostriecin by Chavez and Jacobsen. ${ }^{14}$ In syntheses of compounds of the leptomycin family, the main problem seems to be the combination of the unsaturated lactone and the tetraene chain.

### 4.3 Conclusion

The synthesis of (R)-6-hydroxymethyl-5,6-dihydro- $\alpha$-pyrone was achieved in four steps, including nucleophilic ring opening of a protected glycidol derivative, Lindlar hydrogenation, acid-catalyzed cyclization, and desilylation. Unfortunately, the corresponding aldehyde proved to be extremely unstable, rendering this route impractical if not useless for the synthesis of complex molecules. Various groups reported the use of isopropyl acetal 30 in the synthesis of 6 -substituted 5,6-dihydro- $\alpha$-pyrones. ${ }^{1-6}$ This compound was obtained via a new reaction sequence featuring a very efficient catalytic asymmetric HDA reaction using Jacobsen's HDA catalyst 83a. ${ }^{9}$ Subsequent transacetalization, desilylation, and Dess-Martin oxidation ${ }^{11}$ afforded the required building block 30. This four step sequence not only provides the desired fragment in good overall yield, but also does not require enantiomerically pure starting materials, and uses only a very small amount ( $0.5 \mathrm{~mol} \%$ ) of catalyst 83a.

### 4.4 Experimental section

General. All commercial reagents were purchased from Fluka, Merck or Aldrich and used without further purification, unless otherwise stated. All oxygen- and water-sensitive reactions were carried out in oven-
dried glassware under argon. THF was distilled from potassium/benzophenone ketyl, $\mathrm{Et}_{2} \mathrm{O}$ was distilled from sodium/potassium/benzophenone ketyl, and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was distilled from calcium hydride. Other dry solvents were purchased from Fluka. Flash chromatography was performed using silica gel 60 (230-400 mesh, Merck). Thin-layer chromatography (TLC) was performed using silica plates (Merck, silica gel 60 $\mathrm{F}_{254}$ ) and developed using Cer-MOP reagent [molybdatophosphoric acid ( 5.0 g ), cerium (IV) sulfate ( 2.0 g ), and concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}(16 \mathrm{ml})$ in water $(200 \mathrm{ml})$ ]. Optical rotations were measured using a 1 ml cell with 1 dm path length on a Jasco DIP-1000 digital polarimeter. IR spectra were recorded as $\mathrm{CHCl}_{3}$ solutions or as thin films between NaCl plates on a Bruker IFS 28. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded in $\mathrm{CDCl}_{3}$ on Varian Mercury VX 300 and VX 400 spectrometers using TMS as internal standard. Chemical shifts $\delta$ are reported in parts per million (ppm), coupling constants $J$ are given in Hertz ( Hz ). High resolution ESI mass spectra were obtained from a Bruker Apex 70e Fourier transform ion cyclotron resonance mass spectrometer equipped with a 7.0 Tesla superconducting magnet and an external electrospray ion source (Agilent, off axis spray).
(2S,6R)-6-tert-Butyldimethylsilyloxymethyl-2-methoxy-5,6-dihydropyran 183: To a mixture of tertbutyldimethylsilyloxyacetaldehyde $(9.10 \mathrm{~g}, 52.2 \mathrm{mmol})$, 1-methoxy-1,3-butadiene ( $4.06 \mathrm{~g}, 47.9 \mathrm{mmol}$ ), and crushed molecular sieves $4 \AA(1.30 \mathrm{~g})$ was added $(R, R)$-Jacobsen HDA catalyst ( $116 \mathrm{mg}, 0.24 \mathrm{mmol}$ ). The mixture was stirred for 24 h at rt , after which the starting material was fully consumed as judged by TLC. The product was purified by flash chromatography (column dimensions: $30 \times 5 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 10$ ) to give $183(10.90 \mathrm{~g}, 42.2 \mathrm{mmol}, 88 \%)$ as a slightly brown oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.07(\mathrm{~s}, 6 \mathrm{H})$, $0.90(\mathrm{~s}, 9 \mathrm{H}), 2.06-2.10(\mathrm{~m}, 2 \mathrm{H}), 3.47(\mathrm{~s}, 3 \mathrm{H}), 3.65(\mathrm{dd}, J=10.15,6.24 \mathrm{~Hz}, 1 \mathrm{H}), 3.75(\mathrm{dd}, J=10.15,5.85$ $\mathrm{Hz}, 1 \mathrm{H}), 3.85(\mathrm{~m}, 1 \mathrm{H}), 5.02(\mathrm{~m}, 1 \mathrm{H}), 5.64(\mathrm{dd}, J=10.15,1.56 \mathrm{~Hz}, 1 \mathrm{H}), 5.97(\mathrm{dtd}, J=10.15,6.25,1.56 \mathrm{~Hz}$, $1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=-5.2,-5.1,18.4,26.0,26.8,55.2,65.4,72.5,97.5,126.7,128.2$ $\mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.64(\mathrm{EtOAc} / n-$ hexane $=1: 6)$.
(2R,6R)-6-tert-Butyldimethylsilyloxymethyl-2-isopropoxy-5,6-dihydropyran 184: To a solution of 183 ( $4.58 \mathrm{~g}, 17.6 \mathrm{mmol}$ ) in $\mathrm{PrOH}(125 \mathrm{ml})$ was added PPTS ( $442 \mathrm{mg}, 1.76 \mathrm{mmol}$ ). The mixture was stirred at rt overnight, diluted with brine $(500 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 250 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography (column dimensions: $25 \times 4 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 10$ ) to give $184(4.76 \mathrm{~g}, 16.6 \mathrm{mmol}, 94 \%)$ as a colorless oil. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.07(\mathrm{~s}, 6 \mathrm{H}), 0.90(\mathrm{~s}, 9 \mathrm{H}), 1.17(\mathrm{~d}, \mathrm{~J}=6.25 \mathrm{~Hz}, 3 \mathrm{H})$, $1.25(\mathrm{~d}, J=6.25 \mathrm{~Hz}, 3 \mathrm{H}), 1.97(\mathrm{~m}, 2 \mathrm{H}), 3.62(\mathrm{dd}, J=10.54,4.68 \mathrm{~Hz}, 1 \mathrm{H}), 3.71(\mathrm{dd}, J=10.54,5.85 \mathrm{~Hz}$, $1 \mathrm{H}), 3.99-4.06(\mathrm{~m}, 2 \mathrm{H}), 5.09(\mathrm{~s}, 1 \mathrm{H}), 5.71(\mathrm{~m}, 1 \mathrm{H}), 6.00(\mathrm{~m}, 1 \mathrm{H}) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.61(\mathrm{EtOAc} / n /$ hexane $=1: 10)$.
(2R,6R)-6-Hydroxymethyl-2-isopropoxy-5,6-dihydropyran 44: To a solution of $\mathbf{1 8 4}$ (4.76 g, 16.6 mmol ) in anhydrous THF $(100 \mathrm{ml})$ was added TBAF $\cdot 3 \mathrm{H}_{2} \mathrm{O}(5.51 \mathrm{~g}, 17.5 \mathrm{mmol})$ and the mixture was stirred for 1.5 h at rt . After dilution with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(300 \mathrm{ml})$, the mixture was extracted with $t \mathrm{BuOMe}(3 \times 150 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography (column dimensions: $25 \times 4 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 3$ ) to give $44(1.85 \mathrm{~g}, 10.7$ $\mathrm{mmol}, 65 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=1.18(\mathrm{~d}, J=6.24 \mathrm{~Hz}, 3 \mathrm{H}), 1.25(\mathrm{~d}, J=6.25$ $\mathrm{Hz}, 3 \mathrm{H}), 1.89$ (dddd, $J=17.56,5.46,3.51,1.56 \mathrm{~Hz}, 1 \mathrm{H}), 2.14$ (dddt, $J=17.56,11.32,2.34,1.95 \mathrm{~Hz}, 1 \mathrm{H}$ ), $2.33(\mathrm{dd}, J=5.85,5.46 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{OH}), 3.61(\mathrm{~m}, 1 \mathrm{H}), 3.71(\mathrm{~m}, 1 \mathrm{H}), 4.00($ heptet, $J=6.25 \mathrm{~Hz}, 1 \mathrm{H}), 4.08(\mathrm{~m}$, $1 \mathrm{H}), 5.11(\mathrm{~s}, 1 \mathrm{H}), 5.72(\mathrm{dtd}, J=10.15,2.73,1.56 \mathrm{~Hz}, 1 \mathrm{H}), 6.00(\mathrm{dd}, J=10.15,5.85 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=21.97,23.83,26.04,65.14,66.64,69.41,92.64,125.56,127.94 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.21$ $(\mathrm{EtOAc} / n /$ hexane $=1: 4)$.
(2R,6R)-6-Formyl-2-isopropoxy-5,6-dihydropyran 30: To a solution of 44 ( $86 \mathrm{mg}, 0.50 \mathrm{mmol}$ ) in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \mathrm{ml})$ was added Dess-Martin periodinane ( $254 \mathrm{mg}, 0.60 \mathrm{mmol}$ ) and the mixture was stirred for 1 h at rt , after which the starting material was fully consumed as judged by TLC. The reaction mixture was transferred to a flash column (column dimensions) and eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{tBuOMe}$ (20:1), affording $30(81.4 \mathrm{mg}, 0.48 \mathrm{mmol}, 96 \%)$ as a colorless, somewhat volatile liquid. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 400\right.$ $\mathrm{MHz}): \delta=1.21(\mathrm{~d}, J=6.25 \mathrm{~Hz}, 3 \mathrm{H}), 1.25(\mathrm{~d}, J=6.25 \mathrm{~Hz}, 3 \mathrm{H}), 2.12-2.29(\mathrm{~m}, 2 \mathrm{H}), 4.07$ (heptet, $J=6.25$ $\mathrm{Hz}, 1 \mathrm{H}), 4.43(\mathrm{dd}, J=11.31,4.29 \mathrm{~Hz}, 1 \mathrm{H}), 5.21(\mathrm{~d}, J=1.17 \mathrm{~Hz}, 1 \mathrm{H}), 5.76(\mathrm{~m}, 1 \mathrm{H}), 6.02(\mathrm{~m}, 1 \mathrm{H}), 9.74(\mathrm{~s}$, 1H) ppm.
(S)-tert-Butyldimethylsilyl glycidyl ether 186: To a solution of imidazole ( $1.22 \mathrm{~g}, 18.0 \mathrm{mmol}$ ) and (S)glycidol ( $995 \mu \mathrm{l}, 1.11 \mathrm{~g}, 15.0 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(15 \mathrm{ml})$ was added at $0^{\circ} \mathrm{C}$ tert-butyldimethylsilyl chloride $(2.49 \mathrm{~g}, 16.5 \mathrm{mmol})$. The mixture was stirred for 2 h at rt and quenched by addition of sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}$. The mixture was extracted three times with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and the combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo, affording $186(2.35 \mathrm{~g}, 12.5 \mathrm{mmol}, 83 \%)$ as a colorless liquid. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right): \delta=0.06(\mathrm{~s}, 3 \mathrm{H}), 0.07(\mathrm{~s}, 3 \mathrm{H}), 0.89(\mathrm{~s}, 9 \mathrm{H}), 2.62(\mathrm{dd}, J=5.15,2.67 \mathrm{~Hz}, 1 \mathrm{H}), 2.76(\mathrm{dd}$, $J=5.08,4.11 \mathrm{~Hz}, 1 \mathrm{H}), 3.07(\mathrm{dddd}, J=4.76,4.111,3.19,2.76 \mathrm{~Hz}, 1 \mathrm{H}), 3.64(\mathrm{dd}, J=11.92,4.76 \mathrm{~Hz}, 1 \mathrm{H})$, $3.84(\mathrm{dd}, J=11.92,3.19 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm}$.

Methyl (R)-6-tert-butyldimethylsilyloxy-5-hydroxyhex-2-ynoate 187: To a solution of methyl propiolate $(6.23 \mathrm{ml}, 5.88 \mathrm{~g}, 70.0 \mathrm{mmol})$ in THF $(80 \mathrm{ml})$ was added slowly at $-78^{\circ} \mathrm{C} n-\mathrm{BuLi}(1.6 \mathrm{M}$ in hexane, 43.8 ml , 70.0 mmol ). (Caution! If the reaction temperature exceeds $\sim-55^{\circ} \mathrm{C}$, decomposition takes place!) The solution was stirred for 20 min . at $-78^{\circ} \mathrm{C}$ and a solution of tert-butyldimethylsilyl glycidyl ether $(\mathbf{1 8 6}, 8,74$
$\mathrm{g}, 46.4 \mathrm{mmol})$ in THF ( 30 ml ) was added at $-78^{\circ} \mathrm{C}$. The mixture was stirred for an additional 20 min . at $-78^{\circ} \mathrm{C}$ and $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}(8.87 \mathrm{ml}, 9.94 \mathrm{~g}, 70.0 \mathrm{mmol})$ was added dropwise. The mixture was stirred for 2 h at $-78^{\circ} \mathrm{C}$. The reaction was quenched by addition of sat.aq. $\mathrm{NH}_{4} \mathrm{Cl}(15 \mathrm{ml})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 50$ $\mathrm{ml})$. The combined organic fractions were washed with sat aq. $\mathrm{NaHCO}_{3}(2 \times 50 \mathrm{ml})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. Purification by flash chromatography (column dimension: $25 \times 4 \mathrm{~cm}$, $\mathrm{EtOAc} / \mathrm{PE}=1: 4)$ yielded $187(10.7 \mathrm{~g}, 39.2 \mathrm{mmol}, 84 \%)$ as a slightly yellow oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200\right.$ $\mathrm{MHz}): \delta=0.00(\mathrm{~s}, 6 \mathrm{H}), 0.81(\mathrm{~s}, 9 \mathrm{H}), 2.48(\mathrm{~d}, \mathrm{~J}=7.38 \mathrm{~Hz}, 2 \mathrm{H}), 3.49-3.66(\mathrm{~m}, 2 \mathrm{H}), 3.68(\mathrm{~s}, 3 \mathrm{H}), 3.72-3.79$ (m, 1H) ppm. ${ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 50 \mathrm{MHz}\right): \delta=<-5.0$ 18.0, 23.0, 25.6, 52.4, 65.2, 69.4, 74.1, 85.8, 153.8 ppm.

Methyl (R)-6-tert-butyldimethylsilyloxy-5-hydroxyhex-2Z-enoate 188: To a solution of alkyne 187 $(10.32 \mathrm{~g}, 37.9 \mathrm{mmol})$ in EtOAc ( 200 ml ) was added Lindlar catalyst $(1.2 \mathrm{~g})$. The mixture was stirred for 5 h under a 1 bar $\mathrm{H}_{2}$ atmosphere. The mixture was filtered over Celite and the filtrate was washed with sat. aq. $\mathrm{NaHCO}_{3}(100 \mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$ and concentrated in vacuo. The crude product contained the desired product $(E / Z>1: 20)$ in pure form as judged by ${ }^{1} \mathrm{H}$ NMR, but it was further purified (to remove traces of palladium) by flash chromatography (column dimensions: $25 \times 5 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 4$ ) to give $188(9.63 \mathrm{~g}$, $35.1 \mathrm{mmol}, 93 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right): \delta=0.00(\mathrm{~s}, 6 \mathrm{H}), 0.83(\mathrm{~s}, 9 \mathrm{H}), 2.64-2.89$ $(\mathrm{m}, 2 \mathrm{H}), 2.93(\mathrm{bs}, 1 \mathrm{H}, \mathrm{OH}), 3.43-3.61(\mathrm{~m}, 2 \mathrm{H}), 3.62(\mathrm{~s}, 3 \mathrm{H}), 3.64-3.72(\mathrm{~m}, 1 \mathrm{H}), 5.81(\mathrm{dt}, J=11.52,1.58$ $\mathrm{Hz}, 1 \mathrm{H}), 6.26(\mathrm{dt}, J=11.52,7.46 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 50 \mathrm{MHz}\right): \delta=18.0,25.6,32.4,66.7$, 71.0, 120.6, 146.2, 166.6 ppm .
(R)-6-(tert-butyldimethylsilyloxy)methyl-5,6-dihydro- $\alpha$-pyrone 189: To a solution of hydroxy ester 188 $(274 \mathrm{mg}, 1.00 \mathrm{mmol})$ in benzene $(5 \mathrm{ml})$ was added PPTS $(25 \mathrm{mg}, 0.10 \mathrm{mmol})$ and the mixture was heated to reflux for 5.5 h . The mixture was allowed to cool to room temperature, diluted with $\mathrm{Et}_{2} \mathrm{O}(50 \mathrm{ml})$ and washed with $\mathrm{H}_{2} \mathrm{O}(25 \mathrm{ml})$ and brine $(25 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, concentrated in vacuo, and purified by flash chromatography (column dimension: $25 \times 2 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=$ $1: 2)$ to give $189(206 \mathrm{mg}, 0.85 \mathrm{mmol}, 85 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right): \delta=0.08$ (s, $6 \mathrm{H}), 0.89(\mathrm{~s}, 9 \mathrm{H}), 2.32-2.63(\mathrm{~m}, 2 \mathrm{H}), 3.81(\mathrm{~d}, J=5.05 \mathrm{~Hz}, 1 \mathrm{H}), 4.46(\mathrm{~m}, 1 \mathrm{H}), 6.00(\mathrm{dt}, J=9.68,1.21 \mathrm{~Hz}$, $1 \mathrm{H}), 6.90$ (ddd, $J=9.58,5.55,2.95 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm}$.
(R)-6-hydroxymethyl-5,6-dihydro- $\alpha$-pyrone 190: To a solution of TBS ether $\mathbf{1 8 9}$ ( $1.21 \mathrm{~g}, 5.00 \mathrm{mmol}$ ) in THF ( 25 ml ) was added TBAF $\cdot 3 \mathrm{H}_{2} \mathrm{O}(1.74 \mathrm{~g}, 5.50 \mathrm{mmol})$. The mixture was stirred for 16 h at rt . The mixture was concentrated in vacuo, and purified by flash chromatography (column dimension: $25 \times 2.5 \mathrm{~cm}$, $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}=10: 1\right)$ to give $190(365 \mathrm{mg}, 2.85 \mathrm{mmol}, 57 \%)$ as a colorless oil that crystallized upon
storage. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta=2.32(\mathrm{~m}, 1 \mathrm{H}), 2.62(\mathrm{~m}, 1 \mathrm{H}), 3.75(\mathrm{dd}, J=12.31,4.69 \mathrm{~Hz}, 1 \mathrm{H})$, $3.90(\mathrm{dd}, J=12.31,3.23 \mathrm{~Hz}, 1 \mathrm{H}), 4.56(\mathrm{~m}, 1 \mathrm{H}), 6.04(\mathrm{dd}, J=9.67,2.05,1 \mathrm{H}), 6.94(\mathrm{ddd}, J=9.67,6.16$, $2.25 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=<-5.0,25.1,63.1,78.3,120.1,145.7,164.0 \mathrm{ppm}$.

## 5

Connection of the fragments

## 5 Connection of the fragments

### 5.1 Retrosynthesis

The connection of A, B, and C fragments was envisioned to be achieved through two Wittig reactions, the phosphonium salt being present on the terpenoid fragment in both occasions and the aldehyde moiety on the A and C fragments. There are, obviously, two approaches to construct the full skeleton: (i) $\mathrm{B}+\mathrm{C} \rightarrow \mathrm{BC} \rightarrow \mathrm{ABC}$ (right to left) and (ii) $\mathrm{A}+\mathrm{B} \rightarrow \mathrm{AB}$ $\rightarrow \mathrm{ABC}$ (left to right).

Since the synthesis of fragment A requires the highest number of steps, the former route can be considered more efficient in terms of convergence. The latter route, however, provides a viable alternative, because, at this stage of the synthesis, the available amount of A and C building blocks were comparable.

### 5.2 Right to left route

Aldehyde $\mathbf{3 0}$ was reacted with terpene-derived phosphonium salts $\mathbf{1 7 6}$ and $\mathbf{1 7 9}$ (using the procedure of the corresponding Wittig reaction in Kalesse's total synthesis of $(+)$ ratjadone ${ }^{1,2}$ ) to give coupling products 191 and 192 (differing in protective group and 12,13 double bond geometry (ratjadone numbering)) in reasonable to good yield. However, neutralization of the slightly acidic silica with $\mathrm{Et}_{3} \mathrm{~N}$ prior to flash chromatography proved essential, and neglecting this resulted in a loss of up to $75 \%$ of the product.

Figure 5.1. Right to left and left to right strategies

The next task at hand was selective cleavage of the protective group on the terpenoid alcohol in the presence of the acetal function on the C ring. This proved impossible for 191, which is hardly surprising since a THP ether is also an acetal. The acetate in 192 was considered a more suitable protective group at this position. Indeed, formation of the desired alcohol was observed by TLC analysis upon treatment with $\mathrm{K}_{2} \mathrm{CO}_{3}$ in MeOH . TLC analysis of the product solution also indicated presence of the desired alcohol 193, uncontaminated with other compounds. After concentration of the product solution,
however, no product alcohol could be detected, and a mixture of products was formed. After three days, the product mixture converged to a single, unidentified product. A possible explanation for this observation is displacement of the isopropoxy group of the acetal by the newly formed allylic alcohol function. This instability may also be a reason why such intermediates are not found in either Kalesse's ${ }^{1,2}$ or Williams ${ }^{13}$ synthesis of ratjadone.
 176: $12,13-Z, \mathrm{PG}=\mathrm{Ac}$

192: $12,13-Z, \mathrm{PG}=\mathrm{Ac}$

Scheme 5.1. (a) KOtBu , toluene, $0^{\circ} \mathrm{C}, 89 \%$ for 191, $49 \%$ for 192; (b) $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{MeOH}$.

This problem was considered a major reason to abandon this route, since it was inherent to the synthesis planning and could hardly be circumvented. However, it still may be useful for the synthesis of derivatives lacking the acetal functionality at the C ring. Therefore, it was decided to construct a derivative with a 2,5-dihydroxyphenyl C ring. This moiety is easily available and has the advantage that it can be e.g. transformed to a quinone, which is expected to display a similar electrophilicity as the $\alpha, \beta$-unsaturated $\delta$-lactone of ratjadone. For this purpose, commercially available 2,5-dihydroxybenzaldehyde (194) was protected as a bis-TBS ether and subsequently reacted with terpene-derived phosphonium salt 178, giving Wittig product 196 in moderate yield. It is unclear why the yield in this case is much lower than in comparable reactions, where the yield is often excellent (90-100\%).

Scheme 5.2. (a) TBSCl, imidazole, DMF, $81 \%$; (b) 178, KOtBu , toluene, $0^{\circ} \mathrm{C}, 42 \%$; (c) $\mathrm{LiAlH}_{4}, \mathrm{THF}, 0^{\circ} \mathrm{C}$, $95 \%$; (d) NCS, $\mathrm{Me}_{2} \mathrm{~S}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-78 \rightarrow-10^{\circ} \mathrm{C}, 95 \%$; (e) $\mathrm{PBu}_{3}$; (f) 108, KOtBu , toluene, $0^{\circ} \mathrm{C}, 98 \%$ over two steps; (g) HF•py, py/THF 1:1, 65\%.

The acetate group of the Wittig product 196 was cleaved by reduction (treatment with $\mathrm{K}_{2} \mathrm{CO}_{3}$ in MeOH led to partial cleavage of the phenolic TBS ethers) and the resulting alcohol was converted to tributylphosphonium salt 199 in a two step sequence. Subsequently, a second Wittig reaction with A ring aldehyde 108 afforded tetrakis-TBS ether 200 in excellent yield. The final cleavage of the four TBS ethers was troublesome. Reaction with TBAF in THF led to rapid decomposition of the starting material. When 200 was reacted with TBAF in THF in the presence of AcOH , the phenolic TBS ethers were cleaved smoothly, but cleavage of the remaining two TBS ethers was extremely slow and led to partial decomposition. Fortunately, treatment with HF•py in a $1: 1$ mixture of pyridine and THF (under similar conditions as the final desilylation in Kalesse's total synthesis of $(+)$-ratjadone ${ }^{1,2}$ ) afforded ratjadone analogue 201 in $65 \%$ yield.
Attempts to oxidize hydroquinone 201 to the corresponding quinone using DDQ resulted in the formation of an unstable product, presumably the quinone. Possibly, the electrophilic quinone is susceptible to intramolecular attack by the adjacent electron-rich diene, leading to a bicylic structure. This could, however, not be confirmed, since the product was not obtained in pure form.

### 5.3 Left to right route

Due to the problems encountered in the right to left route, we decided to pursue the inverse approach. In order to avoid unnecessary wasting of valuable fully functionalized A ring fragment, we decided to carry out some preliminary studies to validate the viability of this approach. Since Kalesse and co-workers reported that ratjadone derivative 54 with a monosubstituted THP ring was still a very active compound $\left(\mathrm{IC}_{50}=5.0 \mathrm{ng} \mathrm{ml}{ }^{-1}\right),{ }^{4}$ we considered using a simplified A ring fragment of type 202.

Figure 5.2. Simplified A ring fragment.

Commercially available ( $\pm$ )-2-(hydroxymethyl)tetrahydropyran was converted to the corresponding volatile aldehyde 203 by Swern oxidation. ${ }^{5}$ Aldehyde 203 was then treated with 2-lithio-1,3-dithiane to give 204. The resulting alcohol function was then protected as a TBS ether (205) or an acetate (206). Hydrolysis of the thioacetal of 205 under various conditions $\left(\mathrm{PhI}\left(\mathrm{O}_{2} \mathrm{CCF}_{3}\right)_{2}, \mathrm{CH}_{3} \mathrm{CN} / \mathrm{H}_{2} \mathrm{O} ; \mathrm{MeI}, \mathrm{CaCO}_{3}, \mathrm{CH}_{3} \mathrm{CN} / \mathrm{H}_{2} \mathrm{O}\right)$ was apparently accompanied with cleavage of the silyl ether.

Scheme 5.3. (a) $\left(\mathrm{COCl}_{2}\right.$, DMSO, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-78 \rightarrow 0^{\circ} \mathrm{C}, 65 \%$; (b) 1,3-dithiane, $n \mathrm{BuLi}$, THF, $-78^{\circ} \mathrm{C}$, then 203, $-78 \rightarrow 25^{\circ} \mathrm{C}, 70 \%$; (c) TBSOTf, 2,6-lutidine, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78 \rightarrow 0^{\circ} \mathrm{C}, 91 \%$ (borsm); (d) AcCl, py, $43 \%$; (e) $\mathrm{PhI}\left(\mathrm{O}_{2} \mathrm{CCF}_{3}\right)_{2}, \mathrm{CH}_{3} \mathrm{CN} / \mathrm{H}_{2} \mathrm{O} 9: 1$; (f) 50 eq. MeI, $\mathrm{CaCO}_{3}, \mathrm{CH}_{3} \mathrm{CN}^{2} \mathrm{H}_{2} \mathrm{O} 2: 1,96 \%$ for 202b.

Whereas the Stork protocol ${ }^{6}\left(\mathrm{PhI}\left(\mathrm{O}_{2} \mathrm{CCF}_{3}\right)_{2}, \mathrm{CH}_{3} \mathrm{CN} / \mathrm{H}_{2} \mathrm{O}\right)$ was also unsuccessful with 206, treatment with excess MeI and $\mathrm{CaCO}_{3}$ in $\mathrm{CH}_{3} \mathrm{CN} / \mathrm{H}_{2} \mathrm{O}$ led to clean conversion to the desired aldehyde 202b.

Simplified A ring fragment 202b was then connected to terpenoid fragment 182 and the $\omega$-TBS ether was converted to the corresponding tributylphosphonium salt 210 in the familiar three step sequence.

Scheme 5.4. (a) 182, KOtBu , toluene, $0^{\circ} \mathrm{C}, 77 \%$; (b) $\mathrm{TBAF} \cdot 3 \mathrm{H}_{2} \mathrm{O}, \mathrm{AcOH}, \mathrm{THF}, 0^{\circ} \mathrm{C} \rightarrow \mathrm{rt}, 73 \%$; (c) NCS , $\mathrm{Me}_{2} \mathrm{~S}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-78 \rightarrow-10^{\circ} \mathrm{C}, 86 \%$; (d) $\mathrm{PBu}_{3}$; (e) 30, KOtBu , toluene, $0^{\circ} \mathrm{C}, 77 \%$ over two steps; (f) $\mathrm{K}_{2} \mathrm{CO}_{3}$, $\mathrm{MeOH}, 77 \%$; (g) PPTS, acetone/ $\mathrm{H}_{2} \mathrm{O}$ 6:1, quant. (h) various conditions, no reaction or decomposition.

Wittig reaction of phosphonium salt 210 and C ring fragment $\mathbf{3 0}$ then afforded 211. The final steps to a simplified ratjadone analogue were cleavage of the acetal and oxidation of the resulting lactol, followed eventually by cleavage of the acetate. It was shown that the acetate group could be selectively cleaved at the stage of $\mathbf{2 1 1}$. To proceed to the desired ratjadone analogue, the acetal of 211 was smoothly cleaved by treatment with PPTS in an acetone/water mixture. However, subsequent oxidation of hemiacetal 212 to the lactone was unsuccessful under various conditions, including $\mathrm{MnO}_{2}$ oxidation, TPAP oxidation, and Dess-Martin oxidation. ${ }^{7}$ However, the left to right connection strategy proved valid, and since all three fragments were available in sufficient amounts, we decided to move on to the next stage.

With a reliable procedure for the elaboration of the three fragments to the target ratjadone analogues at hand, we started to construct an analogue with a fully functionalized A ring. For this purpose, A ring aldehyde $\mathbf{1 0 8}$ was reacted with terpene-derived phosphonium salts 182 and 181 to give Wittig products 214 and 215, respectively. Whereas it proved difficult
to cleave the primary TBS ether of $\mathbf{2 1 4}$ selectively, the primary TES ether of $\mathbf{2 1 5}$ was readily cleaved under slightly acidic conditions in MeOH .

Scheme 5.5. (a) 182 or $181, \mathrm{KOtBu}$, toluene, $0^{\circ} \mathrm{C}, 65 \%$ with $182,100 \%$ with $\mathbf{1 8 1}$; (b) PPTS, $\mathrm{MeOH}, 66 \%$.

Thus, for the described strategies, the $\omega$-functionalized terpene fragment with acetate protection at the $\alpha$-position (178) and the $\alpha$-functionalized terpene fragment with TES protection at the $\omega$-position (181) proved the best building blocks with respect to synthesis efficiency and orthogonality. The fact that both fragments are derived from the same synthesis route (both are derived from 164) is an additional advantage.
Alcohol 216 was smoothly converted to tributylphosphonium salt 218 by Corey-Kim reaction ${ }^{8}$ and subsequent treatment with $\mathrm{PBu}_{3}$. Wittig reaction with C ring aldehyde 30 then afforded coupling product 219 in very good yield.

Scheme 5.6. (a) $\mathrm{NCS}, \mathrm{Me}_{2} \mathrm{~S}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-78 \rightarrow-10^{\circ} \mathrm{C}$; (b) $\mathrm{PBu}_{3}$; (c) $\mathbf{3 0}, \mathrm{KOtBu}$, toluene, $0^{\circ} \mathrm{C}, 84 \%$ over three steps; (d) PPTS, acetone/ $\mathrm{H}_{2} \mathrm{O}$ 6:1, $99 \%$.

Although hydrolysis of isopropyl acetal 219 was successful, the resulting lactol 220 (mixture of anomers) proved to be unstable. It was therefore not fully characterized, but only used as an intermediate. The subsequent oxidation to the corresponding lactone 221 proved a great challenge. In our hands, a variety of oxidation methods (including DessMartin, TPAP, and $\mathrm{MnO}_{2}$ oxidations) failed, and the desired lactone could not be obtained. In some cases, the starting material decomposed completely within minutes, whereas in other cases, no reaction seemed to take place at all. On some occasions, conversion to a slighty less polar product (TLC analysis) was observed, but mild aqueous workup resulted in a complex mixture of products.

### 5.4 Conclusion

In summary, the left to right connection strategy provides a reliable way of connecting the three fragments to give the full carbon skeleton of the desired ratjadone analogues. Both a simplified A ring and a fully functionalized one were used. Although the final products could not be obtained, connection of the fragments was very efficient, providing the coupling products in excellent yields. This demonstrates the general validity of the employed strategy.

The right to left strategy could not be used for the synthesis of these compounds because of incompatibility of the free allylic alcohol and the acetal functionality. However, this method proved successful in the synthesis of analogues lacking the acetal function in the C ring. As an example, hydroquinone-containing derivative 201 was synthesized.

### 5.5 Outlook

Although the connection of the ratjadone analogue fragments proceeded very efficiently, the essential oxidation to the lactone failed in our hands, even using literature procedures for similar conversions. This troublesome oxidation might, however, be circumvented by using aldehyde 185, with the lactone functionality already installed. Although this option
was discarded because of the severe instability of aldehyde 185, it might be useful when the aldehyde is generated in situ by Swern oxidation ${ }^{5}$ and the subsequent Wittig reaction is performed at low temperature in a one-pot procedure as described by Tsubuki et al. ${ }^{9}$

By using excess of the lactone fragment 185, a reasonable yield might be achieved. Furthermore, the many alternative A and B fragments that are available, may be employed in the construction of a small library of ratjadone analogues.

### 5.6 Experimental section

General. All commercial reagents were purchased from Fluka, Merck or Aldrich and used without further purification, unless otherwise stated. All oxygen- and water-sensitive reactions were carried out in ovendried glassware under argon. THF was distilled from potassium/benzophenone ketyl, $\mathrm{Et}_{2} \mathrm{O}$ was distilled from sodium/potassium benzophenone ketyl, and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was distilled from calcium hydride. Other dry solvents were purchased from Fluka. Flash chromatography was performed using silica gel 60 (230-400 mesh, Merck). Thin-layer chromatography (TLC) was performed using silica plates (Merck, silica gel 60 $\mathrm{F}_{254}$ ) and developed using Cer-MOP reagent [molybdatophosphoric acid ( 5.0 g ), cerium (IV) sulfate ( 2.0 g ), and concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}(16 \mathrm{ml})$ in water $(200 \mathrm{ml})$ ]. Optical rotations were measured using a 1 ml cell with 1 dm path length on a Jasco DIP-1000 digital polarimeter. IR spectra were recorded as $\mathrm{CHCl}_{3}$ solutions or as thin films between NaCl plates on a Bruker IFS 28. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded in $\mathrm{CDCl}_{3}$ on Varian Mercury VX 300 and VX 400 spectrometers using TMS as internal standard. Chemical shifts $\delta$ are reported in parts per million (ppm), coupling constants $J$ are given in Hertz (Hz). High resolution ESI mass
spectra were obtained from a Bruker Apex 70e Fourier transform ion cyclotron resonance mass spectrometer equipped with a 7.0 Tesla superconducting magnet and an external electrospray ion source (Agilent, off axis spray).

THP ether 191: To 10-chlorogeranyl THP ether (172, $136 \mathrm{mg}, 0.50 \mathrm{mmol}$ ) was added tri-n-butylphosphine $(123 \mu \mathrm{l}, 101 \mathrm{mg}, 0.50 \mathrm{mmol})$ and the mixture was stirred for 3 h at $70^{\circ} \mathrm{C}$. The resulting phosphonium salt 179 was dissolved in toluene ( 4 ml ) and the mixture was cooled to $0^{\circ} \mathrm{C}$. Aldehyde $30(61 \mathrm{mg}, 0.361 \mathrm{mmol})$ was added, followed by KOtBu ( 1 M solution in THF, $650 \mu \mathrm{l}, 0.650 \mathrm{mmol}$ ). The mixture was stirred for 15 $\min$. at $0^{\circ} \mathrm{C}$, then diluted with $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 30 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography on a $\mathrm{Et}_{3} \mathrm{~N}$-neutralized column (column dimensions: $25 \times 2 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 8$ ) to give $191(126 \mathrm{mg}, 0.321 \mathrm{mmol}, 89 \%)$ as a colorless oil. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=1.18(\mathrm{~d}, J=6.25 \mathrm{~Hz}$, $3 \mathrm{H}), 1.24(\mathrm{~d}, J=6.25 \mathrm{~Hz}, 3 \mathrm{H}), 1.51-1.83(\mathrm{~m}, 6 \mathrm{H}), 1.68(\mathrm{~s}, 3 \mathrm{H}), 1.75(\mathrm{~s}, 3 \mathrm{H}), 2.05-2.12(\mathrm{~m}, 4 \mathrm{H}), 2.27(\mathrm{dt}$, $J=7.80,7.42 \mathrm{~Hz}, 2 \mathrm{H}), 3.49-3.52(\mathrm{~m}, 1 \mathrm{H}), 3.86-3.89(\mathrm{~m}, 1 \mathrm{H}), 4.01(\mathrm{~m}, 1 \mathrm{H}), 4.01(\mathrm{dd}, J=11.71,6.64 \mathrm{~Hz}$, $1 \mathrm{H}), 4.24(\mathrm{dd}, J=11.71,6.25 \mathrm{~Hz}, 1 \mathrm{H}), 4.47(\mathrm{~m}, 1 \mathrm{H}), 4.62(\mathrm{dd}, J=3.90,2.73 \mathrm{~Hz}, 1 \mathrm{H}), 5.11(\mathrm{~s}, 1 \mathrm{H}), 5.37$ $(\mathrm{td}, J=6.24,1.17 \mathrm{~Hz}, 1 \mathrm{H}), 5.48(\mathrm{t}, J=6.24 \mathrm{~Hz}, 1 \mathrm{H}), 5.59(\mathrm{dd}, J=15.61,6.24 \mathrm{~Hz}, 1 \mathrm{H}), 5.72(\mathrm{dd}, J=10.15$, $1.56 \mathrm{~Hz}, 1 \mathrm{H}), 5.99(\mathrm{~m}, 1 \mathrm{H}), 6.27 \mathrm{~d}, J=15.61 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=12.5,16.5$, $19.7,22.1,24.0,25.6,26.6,30.8,31.0,39.2,62.3,63.6,66.9,69.3,93.0,97.7,120.8,125.9,126.2,128.4$, 132.6, 133.0, 135.8, 139.5 ppm .

Acetate 192: To 10 -chloroneryl acetate $(\mathbf{1 6 9}, 415 \mathrm{mg}, 1.80 \mathrm{mmol})$ was added tri-n-butylphosphine ( $444 \mu \mathrm{l}$, $364 \mathrm{mg}, 1.80 \mathrm{mmol}$ ) and the mixture was stirred for 3 h at $70^{\circ} \mathrm{C}$. The resulting phosphonium salt 176 was dissolved in toluene ( 15 ml ) and the mixture was cooled to $0^{\circ} \mathrm{C}$. Aldehyde $30(340 \mathrm{mg}, 2.00 \mathrm{mmol})$ was added, followed by $\mathrm{KOtBu}(1 \mathrm{M}$ solution in THF, $2.34 \mathrm{ml}, 2.34 \mathrm{mmol}$ ). The mixture was stirred for 15 min . at $0^{\circ} \mathrm{C}$, then diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 50 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography on a $\mathrm{Et}_{3} \mathrm{~N}$-neutralized column (column dimensions: $25 \times 2 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 10$ ) to give $192(305 \mathrm{mg}, 0.875 \mathrm{mmol}, 49 \%)$ as a colorless oil. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta=1.18(\mathrm{~d}, J=6.04$ $\mathrm{Hz}, 3 \mathrm{H}), 1.24(\mathrm{~d}, J=6.23 \mathrm{~Hz}, 3 \mathrm{H}), 1.76(\mathrm{~s}, 3 \mathrm{H}), 1.77(\mathrm{~s}, 3 \mathrm{H}), 2.05(\mathrm{~s}, 3 \mathrm{H}), 2.06-2.26(\mathrm{~m}, 6 \mathrm{H}), 4.02$ (heptet, $J=6.22 \mathrm{~Hz}, 1 \mathrm{H}), 4.48(\mathrm{~m}, 1 \mathrm{H}), 4.55(\mathrm{~d}, J=7.32 \mathrm{~Hz}, 1 \mathrm{H}), 5.47(\mathrm{~m}, 1 \mathrm{H}), 5.61(\mathrm{dd}, J=15.74,6.41 \mathrm{~Hz}, 1 \mathrm{H})$, 5.70-5.75 (m, 1H), $5.99(\mathrm{~m}, 1 \mathrm{H}), 6.27(\mathrm{~d}, J=15.74 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=12.4$, $21.2,22.1,23.5,24.0,26.9,31.0,31.8,60.9,66.9,69.4,93.0,107.5,119.3,125.9,126.6,128.4,131.8$, $133.5,135 \cdot 6,142.0,170.8 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.67(\mathrm{EtOAc} / n-$ hexane $=1: 4)$.

2,5-Bis(tert-butyldimethylsilyloxy)benzaldehyde 195: To a solution of 2,5-dihydroxy-benzaldehyde (276 $\mathrm{mg}, 2.00 \mathrm{mmol})$ and imidazole $(408 \mathrm{mg}, 6.00 \mathrm{mmol})$ in DMF $(10 \mathrm{ml})$ was added in one portion at $0^{\circ} \mathrm{C}$ tertbutyldimethylsilyl chloride ( $724 \mathrm{mg}, 4.80 \mathrm{mmol}$ ). The mixture was stirred for 2 h at rt , diluted with $\mathrm{H}_{2} \mathrm{O}(25$ $\mathrm{ml})$ and extracted with PE $(3 \times 50 \mathrm{ml})$. The combined organic fractions were washed with $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{ml})$ and brine $(50 \mathrm{ml})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography on a $\mathrm{Et}_{3} \mathrm{~N}$-neutralized column (column dimensions: $25 \times 2.5 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 20$ ) to give $195(591 \mathrm{mg}, 1.61 \mathrm{mmol}, 81 \%)$ as a colorless oil._ ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.18(\mathrm{~s}, 6 \mathrm{H}), 0.25(\mathrm{~s}$, $6 \mathrm{H}), 0.97(\mathrm{~s}, 9 \mathrm{H}), 1.01(\mathrm{~s}, 9 \mathrm{H}), 6.76(\mathrm{~d}, J=8.98 \mathrm{~Hz}, 1 \mathrm{H}), 6.97(\mathrm{dd}, J=8.98,3.12 \mathrm{~Hz}, 1 \mathrm{H}), 7.23(\mathrm{~d}, J=3.12$ $\mathrm{Hz}, 1 \mathrm{H}), 10.39(\mathrm{~s}, 1 \mathrm{H}) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.79(\mathrm{EtOAc} / n$-hexane $=1: 10)$.

1-Acetoxy-9-(2,5-bis(tert-butyldimethylsilyloxy)phenyl)-3,7-dimethyl-2,6,8-nonatriene 196: To 10chlorogeranyl acetate ( $171,577 \mathrm{mg}, 2.50 \mathrm{mmol}$ ) was added tri-n-butylphosphine ( $595 \mu \mathrm{l}, 506 \mathrm{mg}, 2.50$ mmol ) and the mixture was stirred for 3 h at $70^{\circ} \mathrm{C}$. The resulting phosphonium salt $\mathbf{1 7 8}$ was dissolved in toluene ( 25 ml ) and the mixture was cooled to $0^{\circ} \mathrm{C}$. Aldehyde $195(591 \mathrm{mg}, 1.61 \mathrm{mmol})$ was added, followed by $\mathrm{KOtBu}\left(1 \mathrm{M}\right.$ solution in THF, $2.50 \mathrm{ml}, 2.50 \mathrm{mmol}$ ). The mixture was stirred for 15 min . at $0^{\circ} \mathrm{C}$, then diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 100 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography on a $\mathrm{Et}_{3} \mathrm{~N}$-neutralized column (column dimensions: $30 \times 2.5 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 40$ ) to give $196(367 \mathrm{mg}, 0.674 \mathrm{mmol}, 42 \%)$ as a colorless oil. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.17(\mathrm{~s}, 6 \mathrm{H}), 0.18(\mathrm{~s}$, $6 \mathrm{H}), 0.98(\mathrm{~s}, 9 \mathrm{H}), 1.02(\mathrm{~s}, 9 \mathrm{H}), 1.73(\mathrm{~s}, 3 \mathrm{H}), 1.85(\mathrm{~s}, 3 \mathrm{H}), 2.06(\mathrm{~s}, 3 \mathrm{H}), 2.15(\mathrm{~m}, 2 \mathrm{H}), 2.32(\mathrm{~m}, 2 \mathrm{H}), 4.60(\mathrm{~d}$, $J=6.95 \mathrm{~Hz}, 2 \mathrm{H}), 5.38(\mathrm{~m}, 1 \mathrm{H}), 5.59(\mathrm{~m}, 1 \mathrm{H}), 6.56(\mathrm{dd}, J=8.60,2.74 \mathrm{~Hz}, 1 \mathrm{H}), 6.61-6.67(\mathrm{~m}, 2 \mathrm{H}), 6.76(\mathrm{~d}$, $J=16.28 \mathrm{~Hz}, 1 \mathrm{H}), 6.96(\mathrm{~d}, J=2.74 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=-4.3,-4.2,12.6,16.6$, $18.3,18.3,21.1,25.8,25.9,26.8,39.2,61.3,116.2,118.5,119.1,112.0,120.9,129.6,132.3,133.2,134.5$, 141.6, 147.1, 149.6, $170.9 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.64$ ( $\mathrm{EtOAc} / n$-hexane $=1: 4$ ). 9-(2,5-Bis(tert-butyldimethylsilyloxy)phenyl)-3,7-dimethyl-1-hydroxy-2,6,8-nonatriene 197: To a solution of $196(324 \mathrm{mg}, 0.595 \mathrm{mmol})$ in THF $(15 \mathrm{ml})$ was added at $0^{\circ}{ }^{\circ} \mathrm{LiAlH}_{4}(23 \mathrm{mg}, 0.595 \mathrm{mmol})$ and the mixture was stirred for 10 min . at rt . The mixture was diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(25 \mathrm{ml})$ and brine ( 25 $\mathrm{ml})$ and extracted with with $t \mathrm{BuOMe}(3 \times 75 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography on a $\mathrm{Et}_{3} \mathrm{~N}$ neutralized (column dimensions: $25 \times 2.5 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 4$ ) to give $197(284 \mathrm{mg}, 0.564 \mathrm{mmol}, 95 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.17(\mathrm{~s}, 6 \mathrm{H}), 0.18(\mathrm{~s}, 6 \mathrm{H}), 0.98(\mathrm{~s}, 9 \mathrm{H}), 1.03(\mathrm{~s}, 9 \mathrm{H}), 1.70$ $(\mathrm{s}, 3 \mathrm{H}), 1.85(\mathrm{~s}, 3 \mathrm{H}), 2.13(\mathrm{~m}, 2 \mathrm{H}), 2.33(\mathrm{~m}, 2 \mathrm{H}), 4.16(\mathrm{~d}, J=6.63 \mathrm{~Hz}, 2 \mathrm{H}), 5.45(\mathrm{td}, J=6.63,1.17 \mathrm{~Hz}, 1 \mathrm{H})$, $5.60(\mathrm{t}, 7.03 \mathrm{~Hz}, 1 \mathrm{H}), 6.56(\mathrm{dd}, J=8.59,2.73 \mathrm{~Hz}, 1 \mathrm{H}), 6.59-6.67(\mathrm{~m}, 2 \mathrm{H}), 6.76(\mathrm{~d}, J=16.39 \mathrm{~Hz}, 1 \mathrm{H}), 6.96$
$(\mathrm{d}, J=3.12 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=-4.5,-4.4,12.4,16.3,18.1,18.2,25.7,25.8$, $26.8,39.1,59.3,116.3,119.1,120.0,120.9,123.7,129.7,132.7,133.3,134.5,139.1,147.2,149.7 \mathrm{ppm}$. $\mathrm{R}_{\mathrm{f}}=0.32(\mathrm{EtOAc} / n$-hexane $=1: 4)$. HRMS :calcd. for $\mathrm{C}_{29} \mathrm{H}_{50} \mathrm{O}_{3} \mathrm{Si}_{4}(\mathrm{M}+\mathrm{Na})^{+} 525.3191$ found 525.3192.

9-(2,5-Bis(tert-butyldimethylsilyloxy)phenyl)-1-chloro-3,7-dimethyl-2,6,8-nonatriene 198: To a solution of NCS $(90 \mathrm{mg}, 0.673 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{ml})$ was added at $-10^{\circ} \mathrm{C} \mathrm{Me}_{2} \mathrm{~S}(53 \mu \mathrm{l}, 45 \mathrm{mg}, 0.729 \mathrm{mmol})$. The mixture was stirred for 10 min . at $-10^{\circ} \mathrm{C}$, and the resulting white suspension was cooled to $-78^{\circ} \mathrm{C}$. Alcohol $197(282 \mathrm{mg}, 0.561 \mathrm{mmol})$ was added and the mixture was stirred for 1 h at $-10^{\circ} \mathrm{C}$. After dilution with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{ml})$, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 50 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography (column dimensions: $25 \times 2.5 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 20$ ) to give 198 ( $281 \mathrm{mg}, 0.534 \mathrm{mmol}$, $95 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.17(\mathrm{~s}, 6 \mathrm{H}), 0.18,(\mathrm{~s}, 6 \mathrm{H}), 0.98(\mathrm{~s}, 9 \mathrm{H}), 1.02(\mathrm{~s}$, $9 \mathrm{H}), 1.75(\mathrm{~s}, 3 \mathrm{H}), 1.85(\mathrm{~s}, 3 \mathrm{H}), 2.16(\mathrm{~m}, 2 \mathrm{H}), 2.33(\mathrm{~m}, 2 \mathrm{H}), 4.11(\mathrm{~d}, J=8.20 \mathrm{~Hz}, 2 \mathrm{H}), 5.49(\mathrm{~m}, 1 \mathrm{H}), 5.58$ $(\mathrm{m}, 1 \mathrm{H}), 6.56(\mathrm{dd}, J=8.59,2.73 \mathrm{~Hz}, 1 \mathrm{H}), 6.61-6.69(\mathrm{~m}, 2 \mathrm{H}), 6.76(\mathrm{~d}, J=16.39 \mathrm{~Hz}, 1 \mathrm{H}), 6.96(\mathrm{~d}, J=2.73$ $\mathrm{Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=-4.5,-4.3,12.5,16.1,18.1,18.2,25.7,25.8,26.6,39.1$, $41.0,116.3,119.2,120.1,120.6,121.1,129.7,132.2,133.3,134.7,142.2,147.2,149.7 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.82$ $(\mathrm{EtOAc} / n$-hexane $=1: 4)$.

Tetrakis TBS ether 200: To chloride $198(278 \mathrm{mg}, 0.529 \mathrm{mmol})$ was added tri-n-butylphosphine ( $139 \mu \mathrm{l}$, $118 \mathrm{mg}, 0.582 \mathrm{mmol}$ ) and the mixture was stirred for 3 h at $70^{\circ} \mathrm{C}$. The resulting phosphonium salt 199 was dissolved in toluene $(10 \mathrm{ml})$ and the mixture was cooled to $0^{\circ} \mathrm{C}$. Aldehyde $\mathbf{1 0 8}(219 \mathrm{mg}, 0.495 \mathrm{mmol})$ was added, followed by KOtBu ( 1 M solution in THF, $600 \mu \mathrm{l}, 0.600 \mathrm{mmol}$ ). The mixture was stirred for 15 min . at $0^{\circ} \mathrm{C}$, then diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(50 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 50 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography on a $\mathrm{Et}_{3} \mathrm{~N}$-neutralized column (column dimensions: $25 \times 2 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 40$ ) to give $200(442 \mathrm{mg}, 0.483 \mathrm{mmol}, 98 \%)$ as a colorless oil. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.04(\mathrm{~s}, 6 \mathrm{H}), 0.05$ $(\mathrm{s}, 3 \mathrm{H}), 0.09(\mathrm{~s}, 3 \mathrm{H}), 0.14(\mathrm{~s}, 3 \mathrm{H}), 0.17(\mathrm{~s}, 3 \mathrm{H}), 0.19(\mathrm{~s}, 6 \mathrm{H}), 0.86(\mathrm{~d}, J=7.80 \mathrm{~Hz}, 3 \mathrm{H}), 0.88(\mathrm{~s}, 9 \mathrm{H}), 0.93(\mathrm{~s}$, $9 \mathrm{H}), 0.98(\mathrm{~s}, 9 \mathrm{H}), 1.02(\mathrm{~s}, 9 \mathrm{H}), 1.54-1.60(\mathrm{~m}, 2 \mathrm{H}), 1.70(\mathrm{~d}, J=6.64 \mathrm{~Hz}, 3 \mathrm{H}), 1.77(\mathrm{~s}, 3 \mathrm{H}), 1.85(\mathrm{~s}, 3 \mathrm{H}), 2.15$ $(\mathrm{m}, 3 \mathrm{H}), 2.33(\mathrm{~m}, 2 \mathrm{H}) ; 3.23(\mathrm{~m}, 1 \mathrm{H}), 3.81-3.86(\mathrm{~m}, 2 \mathrm{H}), 4.27(\mathrm{~m}, 1 \mathrm{H}), 5.44(\mathrm{ddq}, J=15.22,5.08,1.57 \mathrm{~Hz}$, $1 \mathrm{H}), 5.60-5.67(\mathrm{~m}, 3 \mathrm{H}), 5.89(\mathrm{~d}, J=11.32 \mathrm{~Hz}, 1 \mathrm{H}), 6.48(\mathrm{ddd}, J=15.22,10.93,1.17 \mathrm{~Hz}, 1 \mathrm{H}), 6.56(\mathrm{dd}, J=$ $8.59,3.12 \mathrm{~Hz}, 1 \mathrm{H}), 6.59-6.70(\mathrm{~m}, 2 \mathrm{H}), 6.76(\mathrm{~d}, J=16.39 \mathrm{~Hz}, 1 \mathrm{H}), 6.96(\mathrm{~d}, J=2.73 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=-4.7,-4.61,-4.55,-4.4(2 \mathrm{C}),-4.3(2 \mathrm{C}),-4.2,5.5,12.5,16.7,17.9,18.11,18.17$, $18.23,18.27,25.7(3 \mathrm{C}), 25.8$ (6C), 25.9 (3C), 27.1, $29.8,39.6,40.5,71.8,75.1,79.2,79.8,116.3,119.1$, $120.1,120.9,124.4,125.8,126.6,129.8,130.4,131.7,132.9,133.4,134.5,137.9,147.2,149.7 \mathrm{ppm}$. $\mathrm{R}_{\mathrm{f}}=0.73(\mathrm{EtOAc} / n$-hexane $=1: 10)$. HRMS: calcd. for $\mathrm{C}_{52} \mathrm{H}_{94} \mathrm{O}_{5} \mathrm{Si}_{4}(\mathrm{M}+\mathrm{Na})^{+} 933.6071$ found 933.6077.

Hydroquinone 201: To a solution of tetrakis-TBS ether $200(46.0 \mathrm{mg}, 0.0502 \mathrm{mmol})$ in pyridine ( 1.5 ml ) and THF ( 1.5 ml ) was added HF•py $(1.0 \mathrm{ml})$ and the mixture was stirred for 4 h at rt . The reaction was quenched by addition of sat. aq. $\mathrm{NaHCO}_{3}(25 \mathrm{ml})$, the mixture was brought to pH 4 with $1 \mathrm{Naq} . \mathrm{HCl}$ and extracted with $t \mathrm{BuOMe}(3 \times 25 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was eluted on a small silica column $\left(\mathrm{CHCl}_{3} \rightarrow \mathrm{CHCl}_{3} / \mathrm{MeOH}=10: 1\right)$ to give $201(14.7 \mathrm{mg}, 0.0323 \mathrm{mmol}, 65 \%)$ as a yellow solid. ${ }^{1} \mathrm{H}$ NMR (acetone- $\left.d_{6}, 400 \mathrm{MHz}\right): \delta=0.82(\mathrm{~d}, \mathrm{~J}=$ $7.02 \mathrm{~Hz}, 3 \mathrm{H}), 1.64(\mathrm{~m}, 1 \mathrm{H}), 1.67(\mathrm{~d}, J=6.24 \mathrm{~Hz}, 3 \mathrm{H}), 1.80(\mathrm{~s}, 3 \mathrm{H}), 1.83(\mathrm{~m}, 1 \mathrm{H}), 1.87(\mathrm{~s}, 3 \mathrm{H}), 2.18(\mathrm{~m}$, $2 \mathrm{H}), 2.37(\mathrm{q}, J=7.41 \mathrm{~Hz}, 2 \mathrm{H}), 2.86(\mathrm{~s}, 1 \mathrm{H}) 3.34(\mathrm{ddd}, J=11.32,4.30,2.34 \mathrm{~Hz}, 1 \mathrm{H}), 3.81(\mathrm{t}, J=7.03 \mathrm{~Hz}$, $1 \mathrm{H}), 3.87-3.92(\mathrm{~m}, 2 \mathrm{H}), 4.15(\mathrm{~m}, 1 \mathrm{H}), 5.45(\mathrm{ddq}, J=15.22,5.07,1.56 \mathrm{~Hz}, 1 \mathrm{H}), 5.61-5.73(\mathrm{~m}, 3 \mathrm{H}), 5.92(\mathrm{~d}$, $J=10.93 \mathrm{~Hz}, 1 \mathrm{H}), 6.52(\mathrm{~m}, 2 \mathrm{H}), 6.70(\mathrm{~d}, J=8.58 \mathrm{~Hz}, 1 \mathrm{H}), 6.80(\mathrm{~s}, 1 \mathrm{H}), 6.97(\mathrm{~d}, J=2.73 \mathrm{~Hz}, 1 \mathrm{H}), 7.69(\mathrm{~s}$, $1 \mathrm{H}), 7.90(\mathrm{~s}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR (acetone- $\left.\mathrm{d}_{6}, 100 \mathrm{MHz}\right): \delta=5.8,12.6,16.6,18.0,27.6,30.6,40.2,40.7$, $71.0,74.9,79.7,80.1,112.5,115.7,117.2,121.6,125.72,126.0,126.3,127.7,131.8,132.4,133.2,134.0$, $135.4,138.1,148.6,151.4 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.41\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}=9: 1\right)$.

2-Formyltetrahydropyran 203: To a solution of oxalyl chloride ( $3.84 \mathrm{ml}, 5.59 \mathrm{~g}, 44.0 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(400 \mathrm{ml})$ was added at $-78^{\circ} \mathrm{C}$ DMSO $(6.25 \mathrm{ml}, 6.88 \mathrm{~g}, 88.0 \mathrm{mmol})$. The mixture was stirred for 10 min . at $78^{\circ} \mathrm{C}$ and 2-(hydroxymethyl)tetrahydropyran ( $4.65 \mathrm{~g}, 40.0 \mathrm{mmol}$ ) was added. The mixture was stirred for an additional 20 min at $-78^{\circ} \mathrm{C}, \mathrm{Et}_{3} \mathrm{~N}(27.7 \mathrm{ml}, 20.2 \mathrm{~g}, 200 \mathrm{mmol})$ was added and the mixture was allowed to warm to room temperature. After dilution with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(500 \mathrm{ml})$, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 250 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. Purification by flash chromatography (column dimensions: $30 \times 3 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 3$ ) afforded $203(2.97 \mathrm{~g}, 26.0 \mathrm{mmol}, 65 \%)$ as a volatile colorless liquid. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=1.48-1.66(\mathrm{~m}$, $4 \mathrm{H}), 1.88-1.97(\mathrm{~m}, 2 \mathrm{H}), 3.58(\mathrm{ddd}, J=11.32,10.54,2.73 \mathrm{~Hz}, 1 \mathrm{H}), 3.87(\mathrm{dd}, J=11.32,2.34 \mathrm{~Hz}, 1 \mathrm{H}), 4.11$ $(\mathrm{m}, 1 \mathrm{H}) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.50(\mathrm{EtOAc} / n-$ hexane $=1: 2)$.
(1,3-Dithian-2-yl)-(tetrahydropyran-2-yl)methanol 204: $n$ - $\mathrm{BuLi}(1.6 \mathrm{M}$ in hexane, $9.38 \mathrm{ml}, 15 \mathrm{mmol})$ was added at $-78^{\circ} \mathrm{C}$ to a solution of 1,3 -dithiane $(1.80 \mathrm{~g}, 15.0 \mathrm{mmol})$ in THF $(100 \mathrm{ml})$. The mixture was stirred for 30 min . at $-30^{\circ} \mathrm{C}$, recooled to $-50^{\circ} \mathrm{C}$ and 2 -formyltetrahydropyran $(203,1.14 \mathrm{~g}, 10.0 \mathrm{mmol})$ was added. The mixture was stirred overnight at $0^{\circ} \mathrm{C}$. The reaction was quenched by addition of sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}$ $(100 \mathrm{ml})$ and the mixture was extracted with $t \mathrm{BuOMe}(3 \times 100 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. Purification by flash chromatography (column dimensions: $25 \times 3 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 4 \rightarrow 1: 2)$ afforded $204(1.64 \mathrm{~g}, 7.01 \mathrm{mmol}, 70 \%)$ as a colorless solid. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right.$, minor isomer signals in brackets): $\delta=1.24-1.76(\mathrm{~m}, 4 \mathrm{H}), 1.88-2.11(\mathrm{~m}, 2 \mathrm{H})$,
2.71-2.95 (m, 4H), 3.21-3.84 (m, 3H), $4.22(4.14)(\mathrm{d}, \mathrm{J}=5.86(6.63) \mathrm{Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100\right.$ MHz, minor isomer signals in brackets): $\delta=23.2$ (22.9), 25.8 (25.8), 25.9 (25.9), 28.1 (28.2), 28.5 (28.8), 48.6 (48.3), 68.5 (68.7), 74.8 (75.2), 76.2 (76.9) ppm. $\mathrm{R}_{\mathrm{f}}=0.24(\mathrm{EtOAc} / n$-hexane $=1: 4)$.
tert-Butyldimethylsilyl (1,3-dithian-2-yl)-(tetrahydropyran-2-yl)methyl ether 205: To a solution of alcohol $204(1.64 \mathrm{~g}, 7.00 \mathrm{mmol})$ and 2,6-lutidine $(975 \mu \mathrm{l}, 900 \mathrm{mg}, 8.40 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{ml})$ was added dropwise at $-78^{\circ} \mathrm{C}$ TBSOTf $(1.77 \mathrm{ml}, 2.04 \mathrm{~g}, 7.70 \mathrm{mmol})$. The mixture was allowed to warm to room temperature and then quenched by addition of sat.aq. $\mathrm{NH}_{4} \mathrm{Cl}(25 \mathrm{ml})$. The phases were separated and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 25 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. Purification by flash chromatography (column dimensions: $25 \times 3 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 15)$ afforded $205(1.46 \mathrm{~g}, 4.17 \mathrm{mmol}, 60 \%)$ and unreacted alcohol $204(566 \mathrm{mg}$, $2.41 \mathrm{mmol}, 34 \%$ ) as a colorless oil. The yield based on recovered starting material was therefore $91 \%$. ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.07(\mathrm{~s}, 3 \mathrm{H}), 0.15(\mathrm{~s}, 3 \mathrm{H}), 0.91(\mathrm{~s}, 9 \mathrm{H}), 1.34-1.58(\mathrm{~m}, 4 \mathrm{H}), 1.68(\mathrm{~m}, 1 \mathrm{H}), 1.86$ $(\mathrm{m}, 2 \mathrm{H}), 2.06(\mathrm{~m}, 1 \mathrm{H}), 2.78-3.00(\mathrm{~m}, 4 \mathrm{H}), 3.33-3.38(\mathrm{~m}, 2 \mathrm{H}), 3.70(\mathrm{dd}, J=6.25,2.73 \mathrm{~Hz}, 1 \mathrm{H}), 3.96(\mathrm{~m}$, $1 \mathrm{H}), 4.26(\mathrm{~d}, J=2.74 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm}$.
(1,3-Dithian-2-yl)-(tetrahydropyran-2-yl)methyl acetate 206: To a solution of alcohol 204 ( $2.34 \mathrm{~g}, 10.0$ $\mathrm{mmol})$ in pyridine $(2.0 \mathrm{ml})$ was added at $0^{\circ} \mathrm{C}$ acetyl chloride $(1.07 \mathrm{ml}, 1.18 \mathrm{~g}, 15.0 \mathrm{mmol})$. The mixture was stirred at $0^{\circ} \mathrm{C}$ for 2 h . The mixture was diluted with 1 N aq. $\mathrm{HCl}(250 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times$ $150 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. Purification by flash chromatography (column dimensions: $30 \times 3 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 4$ ) afforded 206 (1.26 $\mathrm{g}, 4.31 \mathrm{mmol}, 43 \%)$ as a colorless oil. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right.$, signals for minor isomer in brackets): $\delta$ $=1.30-1.63(\mathrm{~m}, 4 \mathrm{H}), 1.80-2.10(\mathrm{~m}, 2 \mathrm{H}), 2.17(2.13)(\mathrm{s}, 3 \mathrm{H}), 2.51-2.99(\mathrm{~m}, 4 \mathrm{H}), 3.38-4.26(\mathrm{~m}, 3 \mathrm{H}), 5.25-$ $5.30(\mathrm{~m}, 1 \mathrm{H}) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.63(\mathrm{EtOAc} / n-$ hexane $=1: 2)$.

2-Acetoxy-2-(tetrahydropyran-2-yl)acetaldehyde 202b: To a mixture of dithiane 206 (947 mg, $3.24 \mathrm{mmol}), \mathrm{CaCO}_{3}(1.22 \mathrm{~g}, 12.2 \mathrm{mmol}), \mathrm{CH}_{3} \mathrm{CN}(14 \mathrm{ml})$ and $\mathrm{H}_{2} \mathrm{O}(7 \mathrm{ml})$ was added MeI $(10.1 \mathrm{ml}, 23.0 \mathrm{~g}$, 162 mmol ). The mixture was stirred overnight at rt . The mixture was concentrated in vacuo. The residue was diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{ml})$ and the mixture was extracted with $t \mathrm{BuOMe}(3 \times 100 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. Purification by flash chromatography (column dimensions: $25 \times 2 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 2$ ) afforded $\mathbf{2 0 2 b}(582 \mathrm{mg}, 3.12 \mathrm{mmol}$, $96 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right.$, signals for minor isomer in brackets): $\delta=1.47-1.67$ $(\mathrm{m}, 6 \mathrm{H}), 2.24(2.20)(\mathrm{s}, 3 \mathrm{H}), 3.43(\mathrm{t}, J=11.32 \mathrm{~Hz}, 1 \mathrm{H}),(3.74(\mathrm{td}, J=9.76,3.90 \mathrm{~Hz}, 1 \mathrm{H})), 3.93-4.02(\mathrm{~m}$, 2H), $5.00(4.93)(\mathrm{d}, J=3.13(4.30) \mathrm{Hz}, 1 \mathrm{H}), 9.55(9.60)(\mathrm{s}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right.$, signals
for minor isomer in brackets): $\delta=20.7,23.0$ (22.9), 25.4 (25.6), 27.0 (27.6), 69.1 (68.7), 76.3 (77.1), 79.9 (80.0), 170.3, $197.3(196.8) \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.41(\mathrm{EtOAc} / n-$ hexane $=1: 2)$.

## 1-Acetoxy-10-(tert-butyldimethylsilyl)oxy-5,9-dimethyl-1-(tetrahydropyran-2-yl)deca-2,4,8-triene 207:

To chloride $175(1.21 \mathrm{~g}, 4.00 \mathrm{mmol})$ was added tri-n-butylphosphine ( $987 \mu \mathrm{l}, 809 \mathrm{mg}, 4.00 \mathrm{mmol}$ ) and the mixture was stirred for 3 h at $70^{\circ} \mathrm{C}$. The resulting phosphonium salt 182 was dissolved in toluene ( 30 ml ) and the mixture was cooled to $0^{\circ} \mathrm{C}$. A solution of aldehyde $\mathbf{2 0 2 b}(634 \mathrm{mg}, 3.40 \mathrm{mmol})$ in toluene $(10 \mathrm{ml})$ was added, followed by $\mathrm{KOtBu}(1 \mathrm{M}$ solution in THF, $4.00 \mathrm{ml}, 4.00 \mathrm{mmol}$ ). The mixture was stirred for 15 $\min$. at $0^{\circ} \mathrm{C}$, then diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(100 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 100 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The mixture was stirred for 15 min . at $0^{\circ} \mathrm{C}$, then diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(200 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 150 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography on a $\mathrm{Et}_{3} \mathrm{~N}$-neutralized column (column dimensions: $30 \times 4 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 40$ ) to give $215(2.830 \mathrm{~g}, 4.08 \mathrm{mmol}, 100 \%)$ as a colorless oil. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.04(\mathrm{~s}, 6+3 \mathrm{H}), 0.09(\mathrm{~s}$, $3 \mathrm{H}), 0.61(\mathrm{q}, J=7.81 \mathrm{~Hz}, 6 \mathrm{H}), 0.84(\mathrm{~d}, J=6.64 \mathrm{~Hz}, 3 \mathrm{H}), 0.88(\mathrm{~s}, 9 \mathrm{H}), 0.92(\mathrm{~s}, 9 \mathrm{H}), 0.96(\mathrm{t}, J=7.81 \mathrm{~Hz}$, $9 \mathrm{H}), 1.57(\mathrm{~m}, 2 \mathrm{H}), 1.61(\mathrm{~s}, 3 \mathrm{H}) 1.70(\mathrm{~d}, J=6.25 \mathrm{~Hz}, 3 \mathrm{H}), 1.75(\mathrm{~s}, 3 \mathrm{H}), 2.03(\mathrm{~m}, 1 \mathrm{H}), 2.09(\mathrm{~m}, 2 \mathrm{H}), 2.15(\mathrm{~m}$, $2 \mathrm{H}), 3.23(\mathrm{ddd}, J=10.54,4.29,3.51 \mathrm{~Hz}, 1 \mathrm{H}), 3.81-3.86(\mathrm{~m}, 2 \mathrm{H}), 4.00(\mathrm{~s}, 2 \mathrm{H}), 4.26(\mathrm{~m}, 1 \mathrm{H}), 5.32-5.47(\mathrm{~m}$, $2 \mathrm{H}), 5.56-5.70(\mathrm{~m}, 2 \mathrm{H}), 5.84(\mathrm{~d}, \mathrm{~J}=10.93 \mathrm{~Hz}, 1 \mathrm{H}), 6.47(\mathrm{ddd}, J=15.22,10.93,1.56 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=-4.7,-4.63,-4.57,-4.46,4.45,5.5,13.5,16.6,17.9,18.1,18.3,25.8,25.9$, $26.0,29.7,39.5,40.5,68.3,71.8,75.1,79.2,79.9,124.2,124.3,125.7,126.7,130.4,131.4,134.5$, $138.1 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.47(\mathrm{EtOAc} / n$-hexane $=1: 20)$.

Alcohol 216: To a solution of TES ether $215(2.409 \mathrm{~g}, 3.47 \mathrm{mmol})$ in $\mathrm{MeOH}(40 \mathrm{ml})$ was added PPTS ( $437 \mathrm{mg}, 1.74 \mathrm{mmol}$ ) and the mixture was stirred for 4 h at rt . The mixture was diluted with sat. aq. $\mathrm{NaHCO}_{3}(100 \mathrm{ml})$ and brine $(200 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 200 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography on a $\mathrm{Et}_{3} \mathrm{~N}$-neutralized column (column dimensions: $30 \times 4 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 6$ ) to give $216(1.375 \mathrm{~g}, 2.37 \mathrm{mmol}, 68 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.04(\mathrm{~s}, 6+3 \mathrm{H}), 0.09(\mathrm{~s}$, $3 \mathrm{H}), 0.84(\mathrm{~d}, J=7.03 \mathrm{~Hz}, 3 \mathrm{H}), 0.88(\mathrm{~s}, 9 \mathrm{H}), 0.92(\mathrm{~s}, 9 \mathrm{H}), 1.54-1.64(\mathrm{~m}, 2 \mathrm{H}), 1.67(\mathrm{~s}, 3 \mathrm{H}) 1.70(\mathrm{~d}, J=6.64$
$\mathrm{Hz}, 3 \mathrm{H}), 1.75(\mathrm{~s}, 3 \mathrm{H}), 2.01(\mathrm{~m}, 1 \mathrm{H}), 2.10(\mathrm{~m}, 2 \mathrm{H}), 2.17(\mathrm{~m}, 2 \mathrm{H}), 3.23(\mathrm{~m}, 1 \mathrm{H}), 3.81-3.86(\mathrm{~m}, 2 \mathrm{H}), 3.99(\mathrm{~s}$, $2 \mathrm{H}), 4.26(\mathrm{t}, \mathrm{J}=4.69 \mathrm{~Hz}, 1 \mathrm{H}), 5.38-5.47(\mathrm{~m}, 2 \mathrm{H}), 5.57-5.70(\mathrm{~m}, 2 \mathrm{H}), 5.84(\mathrm{~d}, J=10.92 \mathrm{~Hz}, 1 \mathrm{H}), 6.47(\mathrm{ddd}$, $J=15.22,10.93,1.57 \mathrm{~Hz}, 1 \mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=-4.8,-4.7,-4.6,-4.5,5.7,6.6,13.6$, $16.5,17.8,18.1,18.2,25.76,25.83,26.0,26.9,29.7,39.4,40.4,68.7,71.8,75.0,79.2,79.8,124.4,125.5$, $125.7,126.6,130.4,131.5,135.0,137.8 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.33(\mathrm{EtOAc} / n$-hexane $=1: 4)$.

Chloride 217: To a solution of NCS ( $413 \mathrm{mg}, 3.09 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{ml})$ was added at $-10^{\circ} \mathrm{C} \mathrm{Me}_{2} \mathrm{~S}$ $(246 \mu \mathrm{l}, 210 \mathrm{mg}, 3.38 \mathrm{mmol})$. The mixture was stirred for 10 min . at $-10^{\circ} \mathrm{C}$, and the resulting white suspension was cooled to $-78^{\circ} \mathrm{C}$. Alcohol $216(1.084 \mathrm{~g}, 1.87 \mathrm{mmol})$ was added and the mixture was stirred for 1 h at $-10^{\circ} \mathrm{C}$. After dilution with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(150 \mathrm{ml})$, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times$ $100 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product, which was estimated $>90 \%$ pure by ${ }^{1} \mathrm{H}$ NMR, was used in the next step without further purification, since flash chromatography under various conditions resulted in significant loss of material. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.04(\mathrm{~s}, 6+3 \mathrm{H}), 0.09(\mathrm{~s}, 3 \mathrm{H}), 0.84(\mathrm{~d}, J=7.03 \mathrm{~Hz}, 3 \mathrm{H}), 0.88(\mathrm{~s}, 9 \mathrm{H}), 0.92(\mathrm{~s}$, $9 \mathrm{H}), 1.56(\mathrm{~m}, 2 \mathrm{H}), 1.70(\mathrm{~d}, J=6.64 \mathrm{~Hz}, 3 \mathrm{H}), 1.74(\mathrm{bs}, 3+3 \mathrm{H}), 2.10(\mathrm{~m}, 2 \mathrm{H}), 2.17(\mathrm{~m}, 2 \mathrm{H}), 3.22(\mathrm{~m}, 1 \mathrm{H})$, $3.81-3.86(\mathrm{~m}, 2 \mathrm{H}), 4.01(\mathrm{~s}, 2 \mathrm{H}), 4.26(\mathrm{t}, J=4.69 \mathrm{~Hz}, 1 \mathrm{H}), 5.43(\mathrm{ddq}, J=15.22,5.46,1.57 \mathrm{~Hz}, 1 \mathrm{H}), 5.51(\mathrm{t}$, $J=7.03 \mathrm{~Hz}, 1 \mathrm{H}), 5.58-5.69(\mathrm{~m}, 2 \mathrm{H}), 5.83(\mathrm{~d}, J=10.93 \mathrm{~Hz}, 1 \mathrm{H}), 6.46(\mathrm{ddd}, J=15.22,10.93,1.57 \mathrm{~Hz}, 1 \mathrm{H})$ ppm. $\mathrm{R}_{\mathrm{f}}=0.77(\mathrm{EtOAc} / n$-hexane $=1: 4)$.

Tetraene 219: To chloride 217 (max. 1.87 mmol ) was added tri- $n$-butylphosphine ( $508 \mu \mathrm{l}, 417 \mathrm{mg}$, 2.06 mmol ) and the mixture was stirred for 3 h at $70^{\circ} \mathrm{C}$. The resulting phosphonium salt 218 was dissolved in toluene $(20 \mathrm{ml})$ and the mixture was cooled to $0^{\circ} \mathrm{C}$. Aldehyde $30(426 \mathrm{mg}, 2.50 \mathrm{mmol})$ was added, followed by $\mathrm{KOtBu}\left(1 \mathrm{M}\right.$ solution in THF, $5.00 \mathrm{ml}, 5.00 \mathrm{mmol}$ ). The mixture was stirred for 15 min. at $0^{\circ} \mathrm{C}$, then diluted with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}(150 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 100 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo. The product was purified by flash chromatography on a $\mathrm{Et}_{3} \mathrm{~N}$-neutralized column (column dimensions: $30 \times 3 \mathrm{~cm}, \mathrm{EtOAc} / \mathrm{PE}=1: 10$ ) to give $219\left(1.127 \mathrm{~g}, 1.58 \mathrm{mmol}, 84 \%\right.$ over three steps) as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=0.04$ (s, $6+3 \mathrm{H}), 0.09(\mathrm{~s}, 3 \mathrm{H}), 0.84(\mathrm{~d}, J=6.64 \mathrm{~Hz}, 3 \mathrm{H}), 0.88(\mathrm{~s}, 9 \mathrm{H}), 0.92(\mathrm{~s}, 9 \mathrm{H}), 1.18(\mathrm{~d}, J=5.86 \mathrm{~Hz}, 3 \mathrm{H}), 1.24(\mathrm{~d}$, $J=6.25 \mathrm{~Hz}, 3 \mathrm{H}), 1.56(\mathrm{~m}, 2 \mathrm{H}), 1.70(\mathrm{~d}, J=6.25 \mathrm{~Hz}, 3 \mathrm{H}), 1.75(\mathrm{bs}, 3+3 \mathrm{H}), 2.00-2.31(\mathrm{~m}, 6 \mathrm{H}), 3.22(\mathrm{~m}$, $1 \mathrm{H}), 3.81-3.86(\mathrm{~m}, 2 \mathrm{H}), 4.01(\mathrm{~m}, 1 \mathrm{H}), 4.26(\mathrm{dd}, J=5.08,4.68 \mathrm{~Hz}, 1 \mathrm{H}), 4.48(\mathrm{~m}, 1 \mathrm{H}), 5.12(\mathrm{~s}, 1 \mathrm{H}), 5.41-$ $5.53(\mathrm{~m}, 2 \mathrm{H}), 5.57-5.74(\mathrm{~m}, 4 \mathrm{H}), 5.84(\mathrm{~m}, 1 \mathrm{H}), 6.00(\mathrm{~m}, 1 \mathrm{H}), 6.28(\mathrm{~d}, J=15.61 \mathrm{~Hz}, 1 \mathrm{H}), 6.47(\mathrm{~m}, 1 \mathrm{H}) \mathrm{ppm}$. ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=-4.73,-4.65,-4.59,-4.46,5.4,12.3,16.6,17.9,18.1,18.2,22.0,23.9$, $25.8,25.9,26.7,29.7,30.9,39.4,40.4,66.9,69.3,71.8,75.0,79.2,79.8,93.0,124.4,125.7,126.0,126.4$, $126.6,128.5,130.4,131.6,132.7,133.2,135.9,137.7 \mathrm{ppm} . \mathrm{R}_{\mathrm{f}}=0.65(\mathrm{EtOAc} / n-$ hexane $=1: 4)$.

Hemiacetal 220: To a solution of isopropyl acetal $219(143 \mathrm{mg}, 0.20 \mathrm{mmol})$ in acetone $(18 \mathrm{ml})$ was added a solution of PPTS $(50 \mathrm{mg}, 0.20 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(3 \mathrm{ml})$. The mixture was stirred overnight at rt . The mixture was diluted with sat. aq. $\mathrm{NaHCO}_{3}(50 \mathrm{ml})$ and brine $(100 \mathrm{ml})$ and extracted with $t \mathrm{BuOMe}(3 \times 100 \mathrm{ml})$. The combined organic fractions were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered, and concentrated in vacuo to give crude 220 (133 $\mathrm{mg}, 0.197 \mathrm{mmol}, 99 \%$ ) as a colorless oil, that was used immediately in subsequent oxidation experiments without further purification. $\mathrm{R}_{\mathrm{f}}=0.30(\mathrm{EtOAc} / n$-hexane $=1: 4)$.

## Summary

This thesis describes the development of a flexible synthesis of analogues of the cytotoxic polyketide natural product ratjadone (I). The synthesis features combination of three building blocks of comparable size. The retrosynthetic analysis is shown in Scheme I. Ratjadone analogues II are to be formed by Wittig connection of two aldehyde fragments (tetrahydropyran fragment III and protected lactone fragment $\mathbf{V}$ ) to a central terpenederived fragment IV.

Scheme I. Retrosynthetic analysis of ratjadone analogues.

Fragments III were synthesized by a newly developed diene-controlled asymmetric hetero Diels-Alder reaction. Aldehyde VI (derived from the sugar mannitol) is the sole source of chirality in the synthesis of these compounds. It is used to construct silyloxydienes VII, which reacted efficiently with $\alpha, \beta$-unsaturated aldehydes to give, after desilylation, tetrahydropyran-4-ones VIII (Scheme II). Typically, only the two isomers with all-cis configuration on the ring were formed. The yields of the latter two steps varied from 69$85 \%$, and the diastereoselectivities varied from 1.6:1 to 10:1.

Scheme II. Synthesis of compounds VIII via hetero Diels-Alder reaction.

Ketone VIIIa was then converted in five steps to the adequately protected aldehyde X, which was to be used in further steps (Scheme III). The absolute stereochemistry is different from that in the natural product, but this was considered of minor importance with respect to the effiency in rapid diversity generation.

Scheme III. Synthesis of building block X.
$\alpha, \omega$-Bifunctionalized terpene derivatives IV were synthesized from protected geraniol or nerol by catalytic $\mathrm{SeO}_{2}$ oxidation. The resulting free alcohol could be activated by conversion to the chloride by Corey-Kim reaction. Alternatively, by protective group manipulations, C1 could be activated (Scheme IV).

Scheme IV. Synthesis of bifunctionalized terpenoid building blocks.

Lactone fragment $\mathbf{V}$ was synthesized by making use of Jacobsen's catalytic asymmetric hetero Diels-Alder methodology. Protective group manipulations followed by oxidation afforded desired aldehyde $\mathbf{V}$ (Scheme V).

Scheme V. Synthesis of fragment V.

The fragments were successfully combined using a standard reaction sequence (deprotection - activation - phosphonium salt formation - Wittig reaction). Although the acetal function at C 1 could be hydrolyzed, oxidation to the desired lactone was unsuccessful under a variety of conditions (Scheme VI).

Scheme VI. Connection of fragments X, XIVa, and V.

A (hydro)quinone was considered a reasonable alternative to the lactone ring, and hydroquinone-containing ratjadone analogue $\mathbf{X X}$ was obtained using a similar strategy as above (Scheme VII).

Scheme VII. Synthesis of compound XX.

## Samenvatting

## (Ontwerp en Synthese van Ratjadon-Analoga)

Dit proefschrift beschrijft de ontwikkeling van een flexibele synthese van analoga van de cytotoxische polyketide natuurstof ratjadon (I). Uitgangspunt van de synthese is de combinatie van drie bouwstenen van vergelijkbare grootte. De retrosynthetische analyse is weergegeven in Schema I. Ratjadon-analoga II zullen worden gevormd door Wittig reactie van twee aldehyde fragmenten (tetrahydropyran-fragment III en beschermd lactonfragment $\mathbf{V}$ ) met een centraal terpenoïde fragment IV.

Schema I. Retrosynthetische analyse van ratjadon-analoga.

Fragmenten III werden gesynthetiseerd door middel van een nieuw ontwikkelde diëengecontrolleerde asymmetrische hetero-Diels-Alder reactie. Aldehyde VI (afgeleid van de suiker mannitol) is de enige bron van chiraliteit in de synthese van deze verbindingen. Het werd gebruikt voor de bereiding van silyloxydiënen VII, die efficiënt reageerden met $\alpha, \beta$ onverzadigde aldehydes, leidend tot tetrahydropyran-4-onen VIII (Schema II). In het algemeen werden alleen de twee isomeren met de allen-cis configuratie op de ring
gevormd. De opbrengst van de laatste twee stappen varieerde van $69-85 \%$ en de diastereoselectiviteit varieerde van 1.6:1 tot 10:1.

Schema II. Synthese van verbindingen VIII d.m.v. hetero-Diels-Alder reactie.

Keton VIIIa werd toen in vijf stappen omgezet naar het geschikt beschermde aldehyde X, dat verder in de synthese gebruikt zou worden (Schema III). De absolute stereochemie verschilt van die in de natuurstof, maar dit werd van ondergeschikt belang geacht met betrekking tot de efficiëntie van de snelle diversiteitsontwikkeling.

Schema III. Synthese van bouwsteen X.
$\alpha, \omega$-Gebifunctionaliseerde terpeen-derivaten IV werden gesynthetiseerd vanuit beschermd geraniol of nerol door catalytische $\mathrm{SeO}_{2}$-oxidatie. De daaruit verkregen vrije alcohol kon worden geactiveerd door omzetting in het chloride door Corey-Kim-reactie. Tevens kon door beschermgroepmanipulaties C 1 worden geactiveerd (Schema IV).

Lacton-fragment $\mathbf{V}$ werd gesynthetiseerd door gebruik te maken van Jacobsen's catalytische asymmetrische hetero-Diels-Alder methodologie. Beschermgroepmanipulaties gevolgd door oxidatie leverden het gewenste aldehyde $\mathbf{V}$ op (Schema $V$ ).

Schema IV. Synthese van gebifunctionaliseerde terpenoïde bouwstenen.

Schema V. Synthese van fragment V.

De fragmenten werden op succesvolle wijze aan elkaar bevestigd door middel van een standaard reactie-sequentie (ontscherming - activering - fosfoniumzoutvorming - Wittig reactie). Hoewel de acetaal-functie op C1 kon worden gehydrolyseerd, was oxidatie tot het gewenste lacton onder verschillende omstandigheden niet succesvol (Schema VI).

Schema VI. Verbinding van fragmenten X, XIVa en V.

Een (hydro)quinon werd beschouwd als een redelijk alternatief voor de lactonring en hydroquinon-bevattend ratjadon-analogon $\mathbf{X X}$ werd verkregen via een soortgelijke strategie als hierboven (Schema VII).

Schema VII. Synthese van verbinding XX.

## Zusammenfassung <br> (Entwurf und Synthese von Ratjadon-Analoga)

Die vorliegende Dissertationsschrift beschreibt die Entwicklung einer flexiblen Synthese von Analoga des cytotoxischen Polyketid-Naturstoffs Ratjadon (I). Ausgangspunkt der Synthese ist die Kombination von drie Bausteine vergleichbarer Größe. Die retrosynthetische Analyse ist in Schema I dargestellt. Ratjadon-Analoga II sind hierbei durch eine Wittig Reaktion von zwei Aldehyd-Fragmente (Tetrahydropyran-Fragment III und geschützes Lacton-Fragment $\mathbf{V}$ ) mit einem zentralen Terpenoid-Fragment IV zugänglich.

Schema I. Retrosynthetische Analyse von Ratjadon-Analoga.

Fragmente III wurden mittels eine neu entwickelte Dien-kontrollierten asymmetrischen hetero-Diels-Alder-Reaktion hergestellt. Aldehyd VI (abgeleitet von D-Mannit) ist die einzige chiral-Pool-Quelle in der vorgestellten Synthese von Ratjadon-Analoga. Er dient als Ausgangsstoff für die Darstellung der Silyloxydiene VII, die ausgezeichnet mit $\alpha, \beta$ ungesättigten Aldehyden zu Tetrahydropyran-4-onen VIII (Schema II) reagieren. Als

Produkte wurden ausschließlich die Isomere mit cis-Konfiguration am Ring gebildet. Die Ausbeuten der letzten beiden Schritte variierten von 69-85\% und die Diastereoselektivität zeigte Verhältnisse von 1.6:1 bis 10:1.

Schema II. Synthese von Verbindungen VIII mittels hetero-Diels-Alder-Reaktion.

Keton VIIIa wurde in fünf Schritten in den geschützten Aldehyd X überführt, welcher im weiteren Syntheseverlauf eingesetzt wurde (Schema III). Die absolute Stereochemie unterscheidet sich zwar von der des Naturstoffs, dieser Aspekt kann jedoch im Hinblick auf die Effiziens und Variabilität der Synthese vernachlässigt werden.

Schema III. Synthese von Baustein X.

Mittels $\mathrm{SeO}_{2}$-Oxidation gelangt man ausgehend von Nerol oder Geraniol zum $\alpha, \omega$ bifunktionalisierten Terpen-Derivat IV. Der daraus erhaltene freie Alkohol wurde in einer Corey-Kim-Reaktion in das entsprechende Chlorid überführt. Zusätzlich konnte C 1 durch Schutzgruppenmanipulationen aktiviert werden (Schema IV).

Das Lacton-Fragment $\mathbf{V}$ wurde durch Anwendung der Jacobsen's asymmetrischen hetero-Diels-Alder-Methodologie synthetisiert. Schutzgruppenoperationen und anschließende Oxidation liefern den gewünschten Aldehyd $\mathbf{V}$ (Schema V).

Schema IV. Synthese von bifunktionalisierten Terpenoid-Bausteinen.

Schema V. Synthese von Fragment V.

Die erhaltenen Fragmente wurden abschließend erfolgreich mittels einer StandardReaktionssequenz (Entschützung - Aktivierung - Phosphoniumsalzbildung - WittigReaktion) verknüpft. Obwohl die Acetal-Funktion an C1 hydrolysiert werden konnte, war die Oxidation zum gewünschten Lacton unter verschiedene Bedingungen nicht erfolgreich (Schema VI).

Schema VI. Verknüpfung von Fragmenten X, XIVa und V.
(Hydro-)Chinone können weitläufig als Strukturanaloga des Lactonringes betrachtet werden. Ein Ratjadon-Analogon (XX) mit einem Chinon anstelle des Lactonringes konnte ebenfalls durch eine ähnliche Strategie wie oben (Schema VII) erfolgreich synthetisiert werden.

Schema VII. Synthese von Verbindung XX.

# Acknowledgements, Dankwoord, Danksagung 

, Wissenschaft und Kunst gehören der Welt an, und vor ihnen verschwinden die Schranken der Nationalität"

- Johann Wolfgang von Goethe -

De wetenschap is grenzenloos - dat is mij wel duidelijk geworden tijdens het grote avontuur dat mijn promotie-onderzoek is geworden. Hier heb ik dan de gelegenheid om de mensen die mij op deze reis hebben begeleid te bedanken.

Allereerst ben ik natuurlijk mijn promotor dank verschuldigd. Ludger, mein Doktorvater (so ein schönes deutsches Wort), ich möchte Dir recht herzlich danken, daß Du mir die Möglichkeit gegeben hast an so einem anregenden Thema zu arbeiten. Ich danke Dir auch für das Vertrauen und die Verantwortlichkeit die Du mir gegeben hast.
Ook zou ik natuurlijk mijn co-promotor willen bedanken. Romano, al hebben we niet lang nauw samengewerkt, ik heb het contact met jou altijd als zeer aangenaam ervaren. Ik heb jou, net als je groep, de afgelopen jaren zien groeien en ik geloof zeker dat het in de toekomst alleen maar beter zal gaan. Ook heel veel dank voor al je hulp bij de laatste (zware) loodjes.

Tevens zou ik de leden van de leescommisie willen danken voor het kritisch lezen van mijn manuscript.

Ook op het praktische vlak had ik het niet alleen gered, al is het bij één medestrijder gebleven. Heike, Du hast wirklich sehr gute Arbeit geleistet, und eine Menge von deinen Ergebnissen sind in dieser Doktorarbeit (und in einer schönen Publikation) zu lesen. Es
wundert mich nicht daß Du so schnell einen schönen Job gefunden hast. Ich hoffe, es gefällt Dir immer noch, und wünsche Dir alles Gute für die Zukunft.

Op elke werkvloer, zo ook in het lab, zijn het de collega's die de sfeer maken. De eerste 15 maanden van mijn promotie heb ik het genoegen gehad samen te werken met de zeer gewaardeerde collegae uit het beruchte "bier-is-geen-cola"-tijdperk. André, Kimberly, "Milles", Jeroen, "Wok": een oergezellige groep studenten. De meesten van jullie zijn ook AIO geworden, ik wens jullie heel veel succes. Ook dank aan de collega-AIO's van het eerste uur: Günther (ik ben je erg gaan waarderen en heb meer over chemie van jou geleerd dan van wie dan ook), Udo, Mieke, Michael, Marco, Henri en twee kleurrijke post-docs: Dr. J. Fred Stevens ("Mens'nkinder'n!") and Dr. Einar Bakstad ("Now I have found the right conditions: reflux in DMF over the weekend!") en de altijd gezellige secretaresse Judith. Ik wens jullie allemaal het beste!

Dann ging es natürlich nach Halle. Ich möchte die viele netten Kollegen der Abteilung NWC des IPB herzlich danken. Ich habe mich immer zu Hause gefühlt im Labor. Besonderer Dank gilt den Kollegen die die Zeit nach der Arbeit angenemher gemacht haben („Eeehh!! Biertje??"). Folgenden Kollegen möchte ich besonders danken für ihre praktische Beiträge: Angela Schaks für die Hilfe im Labor; Dr. Jürgen Schmidt und Martina Lerbs für die Massenspektroskopie; Maritta Süsse für die IR-Messungen; Dr. Andrea Porzel für die 2D-NMR-Messungen und natürlich Elisabeth Kaydamov für die Hilfe bei verschiedensten Sachen. Of course, I would also like to thank all english-speaking fellow PhD students and guests in Halle.

Ook dank aan mijn ouders, Koos en Suzanna. Jullie hebben me zoveel dingen meegegeven zonder welke ik nooit zover was gekomen. Jullie hebben altijd mijn keuzes gerespecteerd en mij gesteund in mijn beslissingen en me altijd een veilige thuishaven geboden.

Lieve Henrique, als laatste natuurlijk al mijn dank aan jou. In elk dankwoord is te lezen dat het niet makkelijk is om een relatie met promovendus te hebben, maar zelden geldt dat als in ons geval. Meer dan tweeënhalf jaar heb je me moeten missen tijdens mijn tijd in Duitsland. Ik ben zo dankbaar dat jij er steeds voor me geweest bent. Zonder jouw begrip en liefde was het me allemaal niet gelukt. Dank je.

## Curriculum vitae

Eelco Ruijter was born on September $15^{\text {th }} 1977$ in Barsingerhorn, the Netherlands. He graduated from high school („VWO") at the Openbare Schoolgemeenschap Schagen in 1995. In March 2000, he obtained his M.Sc. from the Department of Organic and Inorganic Chemistry at the Vrije Universiteit Amsterdam in the group of prof. dr. L.A. Wessjohann on the project "Towards a novel synthesis of the epothilone B northern half". He started his Ph.D. project "Design and synthesis of ratjadone analogues" in the same group in March 2000, soon joining the Wessjohann group to the Department of Bioorganic Chemistry at the Institute of Plant Biochemistry in Halle (Saale), Germany. Since August 2004, he is working as a post-doctoral fellow at the Department of Medicinal Chemistry at Utrecht University.

[^0]:    * Based on an analysis of orally available drugs, Lipinski and co-workers postulated the now famous "rule of five". The rule states that, in order to be orally available, drug-like compounds should have: (a) not more than 5 hydrogen bond donors ( -OH and -NH groups); (b) not more than 10 hydrogen bond acceptors (notably O and N ); (c) a molecular weight under 500, and (d) a $\log \mathrm{P}$ value under 5.

[^1]:    ${ }^{\dagger}$ This part of the work was performed in Dr. Micskei's laboratory at Debrecen University. This short research visit was financed by a DAAD/PPP Ungarn program.
    $\ddagger$ Typical procedure: A mixture of $\mathrm{H}_{2} \mathrm{O}(15 \mathrm{ml})$ and DMF $(15 \mathrm{ml})$ was degassed by bubbling Ar through the solution for at least $30 \mathrm{~min} . \mathrm{Cr}(\mathrm{OAc})_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ (10 eq. with respect to the ketone) was added, followed by an amino acid (10 (IDA, NTA, EDTA) or 20 (L-Val, L-His) eq.) and an appropriate amount of $2 \mathrm{Naq} . \mathrm{NaOH}$. Ar was bubbled through the mixture continuously. When all $\mathrm{Cr}(\mathrm{II})$ was in solution, the ketone ( $\sim 50 \mathrm{mg}$ ) was added. The reaction vessel was closed under Ar overpressure and the mixture was stirred overnight. The mixture was diluted with $\mathrm{Et}_{2} \mathrm{O}$ and washed five times with $\mathrm{H}_{2} \mathrm{O}$ and once with brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The crude product was analyzed by ${ }^{1} \mathrm{H}$ NMR to determine the ax./eq. ratio.

[^2]:    § All silyl enol ethers described here show the $\mathrm{M}+\mathrm{Na}+\mathrm{O}$ peak in exact mass measurements; this peak is probably caused by formation of an oxidation side product, which also seems to be the main decomposition product of these compounds.
