

# Metal Sulfides and their Relation to Atmospheric Sulfur on Venus

S.T. PORT, A.C. BRISCOE, V.F. CHEVRIER

ARKANSAS CENTER FOR SPACE AND PLANETARY SCIENCES

THIS STUDY WAS SUPPORTED BY NASA SOLAR SYSTEM WORKINGS GRANT #NNX15AL57G

# Introduction

- ▶ Sulfur is an important constituent in the atmosphere
  - ▶  $\text{SO}_2$
  - ▶  $\text{COS}$
  - ▶  $\text{H}_2\text{SO}_4$
- ▶ More abundant in atmosphere than on Earth
- ▶ Expect a complex Sulfur Cycle on Venus
- ▶ Little understanding of the surface composition
- ▶ Sources and sinks of sulfur?

Fegley, B., et al. (1995)

# Objective

- ▶ **Determine possible sources and sinks for sulfur:**
  - ▶ **Venusian temperature and pressure**
  - ▶ **CO<sub>2</sub>, SO<sub>2</sub>, and COS**

# Mineralogy

## ▶ Galena (PbS)

- ▶ **SO<sub>2</sub> can be released via the oxidation** Abdel-Rehim, A.M., 2006
- ▶ **Most common lead mineral on Earth** Nowak, P. et al., 2009
- ▶ **On list of metal frost candidates** Schaefer, L., et al., 2004

## ▶ Pyrrhotite (Fe<sub>7</sub>S<sub>8</sub>)

- ▶ **Speculated to be one of the most abundant sulfur minerals on Venus** Fegley, B., et al., 1992
- ▶ **Decomposition can release COS** Fegley, B., et al., 1995
- ▶ **On list of metal frost candidates** Fegley, B., et al., 1992

## ▶ Metacinnabar (HgS)

- ▶ **Stable form of cinnabar at high temperatures** Ballirano, P., et al., 2013
- ▶ **Temperature sensitive** Ballirano, P., et al., 2013
- ▶ **Found near volcanic activity** Rytuba J.J. et al., 1992

# Methods

5

- ▶ One gram of each mineral
- ▶ Two Scenarios:
  - ▶ 1. Oven
    - ▶ Lindberg Tube Oven
    - ▶ Temperature
      - ▶ 460°C (avg. lowland altitude)
      - ▶ 425°C (slightly above frost line)
      - ▶ 380°C (11 km)
    - ▶ Gases
      - ▶ CO<sub>2</sub>
      - ▶ CO<sub>2</sub> 100ppm SO<sub>2</sub>
      - ▶ CO<sub>2</sub> 100ppm COS

# Methods

6

## ▶ 2. Chamber

### ▶ UArk Cassiopeia Chamber

### ▶ Temperature/Pressure

▶ 460°C/95 bar

▶ 425°C/75 bar

▶ 380°C/45 bar

### ▶ Gases

▶ CO<sub>2</sub>

▶ CO<sub>2</sub> 100ppm SO<sub>2</sub>

▶ CO<sub>2</sub> 100ppm COS

▶ All experiments lasted 24 hours

▶ All samples were analyzed with the PANalytical X'Pert MRD

# Results

7

- ▶ Pyrrhotite: Untreated (left), 380°C in CO<sub>2</sub>, 425°C in CO<sub>2</sub>, 460°C in CO<sub>2</sub> (right)

# Pyrrhotite CO<sub>2</sub> Oven v. Chamber

	460°C/1 bar (lowlands)	425°C/1 bar (frost line)	380°C/1 bar (highlands)
Oven	<b>Hematite (Fe<sub>2</sub>O<sub>3</sub>)</b> Mikasaite (Fe <sub>2</sub> (SO <sub>4</sub> ) <sub>3</sub> )	Magnetite (Fe <sub>3</sub> O <sub>4</sub> ) Pyrrhotite (Fe <sub>7</sub> S <sub>8</sub> )	Pyrrhotite (Fe <sub>7</sub> S <sub>8</sub> ) Troilite (FeS)
	460°C/95 bar	425°C/75 bar	380°C/45 bar
Chamber	Pyrrhotite Troilite	-----	Pyrrhotite Troilite

# Pyrrhotite $\text{SO}_2$ v. $\text{COS}$ (Oven)

	460°C/1 bar (lowlands)	425°C/1 bar (frost line)	380°C/1 bar (highlands)
$\text{CO}_2/\text{SO}_2$	Pyrrhotite Troilite Hematite	----	Pyrite ( $\text{FeS}_2$ ) Pyrrhotite Hematite Troilite Magnetite
	460°C/1 bar	425°C/1 bar	380°C/1 bar
$\text{CO}_2/\text{COS}$	Hematite Mikasaite	Hematite Maghemite Mikasaite	Pyrrhotite Pyrite Hematite

# Galena CO<sub>2</sub> Oven v. Chamber

	460°C/1 bar (lowlands)	425°C/1 bar (frost line)	380°C/1 bar (highlands)
Oven	Galena (PbS) Anglesite (Pb(SO <sub>4</sub> )) Lanarkite (Pb <sub>2</sub> (SO <sub>4</sub> )O)	Galena (PbS) Anglesite (Pb(SO <sub>4</sub> )) Lanarkite (Pb <sub>2</sub> (SO <sub>4</sub> )O)	Galena (PbS) Anglesite (Pb(SO <sub>4</sub> ))
	460°C/95 bar	425°C/75 bar	380°C/45 bar
Chamber	Galena	-----	Galena PbO (Litharge)

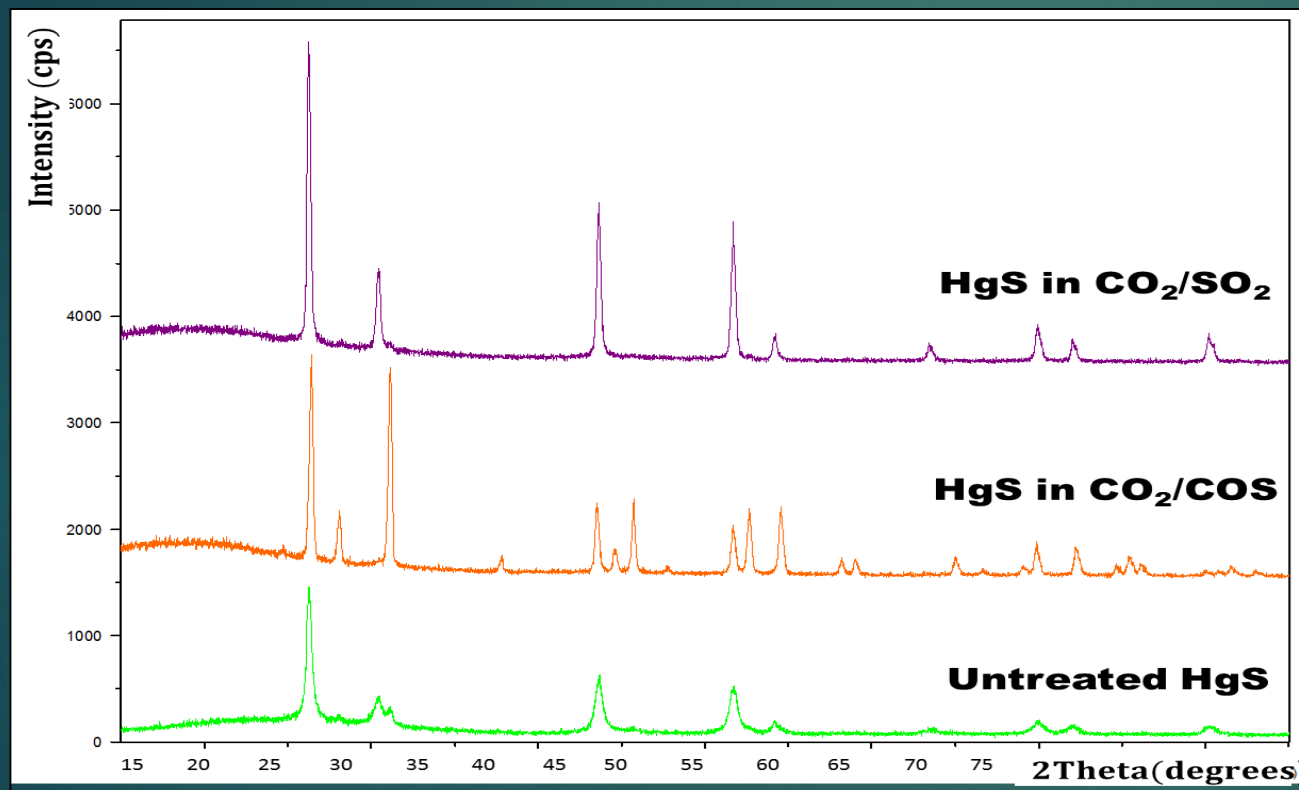

# Galena $\text{SO}_2$ v. $\text{COS}$ (Oven)

11

	460°C/1 bar (lowlands)	425°C/1 bar (frost line)	380°C/1 bar (highlands)
$\text{CO}_2/\text{SO}_2$	<b>Galena Anglesite Lanarkite</b>	<b>Galena Anglesite</b>	<b>Galena Anglesite</b>
	460°C/1 bar	425°C/1 bar	380°C/1 bar
$\text{CO}_2/\text{COS}$	<b>Galena Anglesite</b>	<b>Galena Anglesite</b>	<b>Galena Anglesite</b>

# Metacinnabar

12

	<b>380°C/1 bar (highlands)</b>
<b>CO<sub>2</sub>/SO<sub>2</sub></b>	<b>Metacinnabar</b>
	<b>380°C/1 bar</b>
<b>CO<sub>2</sub>/COS</b>	<b>Cinnabar</b>

# Pyrrhotite

13

- ▶ **Pyrrhotite** → **Magnetite** → **Maghemite** → **Hematite**

Fegley, B., et al., 1995

- ▶ **Troilite**: Vaporization of S increases the ratio of Fe to S

- ▶ **Quicker oxidization** in mixed gas experiments

- ▶ **Pyrite formation** in the low temperature, mixed gas experiments

- ▶ **Product of oxidation**

- ▶  $3\text{Fe}_7\text{S}_8 + 28\text{CO}_2 \leftrightarrow 7\text{Fe}_3\text{O}_4 + 12\text{S}_2 + 28\text{CO}$

Fegley, B., et al., 1995

- ▶ **Unable to verify**

Mycroft, J. R., et al. (1994)

# Galena

- ▶ Formation of Anglesite:

- ▶ Formation of Lanarkite:

- ▶ Formation of Lead Oxide (Litharge):

- ▶  $\text{SO}_2$  produced in all equations

- ▶ Currently unable to verify

# Metacinnabar

15

- ▶ **Instability in all CO<sub>2</sub> experiments in the oven**
- ▶ **Cinnabar is a low T/P version of metacinnabar**
- ▶ **Heating and cooling of metacinnabar can form cinnabar**  
Ballirano, P., et al., 2013
- ▶ **Stability in CO<sub>2</sub> in the chamber at lowland and highland conditions**

# Future Work

- ▶ **Gas Chromatograph**
- ▶ **Gas Mixture Experiments in the Chamber**
- ▶ **In situ Studies with RAMAN**
- ▶ **Longer Experiments (48-72h)**

# Conclusion

- ▶ **Pyrrhotite**
  - ▶ **Unstable in oven**
  - ▶ **Stable in chamber**
  - ▶ **More rapid oxidation in mixed gases**

# Conclusion

- ▶ **Pyrrhotite**
  - ▶ Unstable in oven
  - ▶ Stable in chamber
  - ▶ More rapid oxidation in mixed gases
- ▶ **Galena**
  - ▶ Minor instability in oven
  - ▶ Better stability in chamber
  - ▶ Mixed gases had no effect

# Conclusion

- ▶ **Pyrrhotite**
  - ▶ Unstable in oven
  - ▶ Stable in chamber
  - ▶ More rapid oxidation in mixed gases
- ▶ **Galena**
  - ▶ Minor instability in oven
  - ▶ Better stability in chamber
  - ▶ Mixed gases had no effect
- ▶ **Metacinnabar**
  - ▶ Unstable in high temperatures in oven
  - ▶ May show better stability in chamber

# Conclusion

- ▶ **Pyrrhotite**
  - ▶ Unstable in oven
  - ▶ Stable in chamber
  - ▶ More rapid oxidation in mixed gases
- ▶ **Galena**
  - ▶ Minor instability in oven
  - ▶ Better stability in chamber
  - ▶ Mixed gases had no effect
- ▶ **Metacinnabar**
  - ▶ Unstable in high temperatures in oven
  - ▶ May show better stability in chamber
- ▶ **Mixed gas experiments need to be completed in the chamber**
- ▶ **Currently cannot determine what gases are released during reactions**
  - ▶ **Source/Sink?**
