Advanced Plant Habitat

An automated plant growth facility for conducting plant research supporting space biology and food production projects on the International Space Station (ISS).

Plants are grown in the Science Carrier (SC) of the APH, (0.2 m² instrumented) root module.

The SC is packed with media, seeded on Earth, and transferred dry to the APH facility on ISS. The plant experiments are initiated when the SC is installed in the APH growth chamber and it is fully wetted.

The planting and germination protocols for growing wheat (cv Apogee) and Arabidopsis (cv Columbia) were developed and tested at KSC in the APH Engineering Development Unit (EDU). Protocols were tested on orbit during the post-installation growth checkout of APH on ISS.

Hardware Validation – 1st plant growth test

APH Facility – Assembly / Functional Test

Astronaut Joe Acaba

- APH - transported to ISS on SpaceX 11 and OA-7.
- APH - assembled on the Kibo Module in 27Oct17.
- First power-up and 5-day functional test - 27Nov to 1Dec 2017 tested:
 - commanding, telemetry, and data retrieval from PHARMER.
 - T/RH control modules at 23 C/70% RH, 18 C/50% RH, 18 C/90% RH, 30 C/90% RH, and 30 C/50% RH.
 - Light levels
 - CO₂ scrubbing, CO₂ injection, Ethylene Scrubbing functions
 - Experiment Profile scripts (T, RH, CO₂, Pictures).
- An acoustic test was completed on 8Dec17.

APH Facility – Validation Schedule

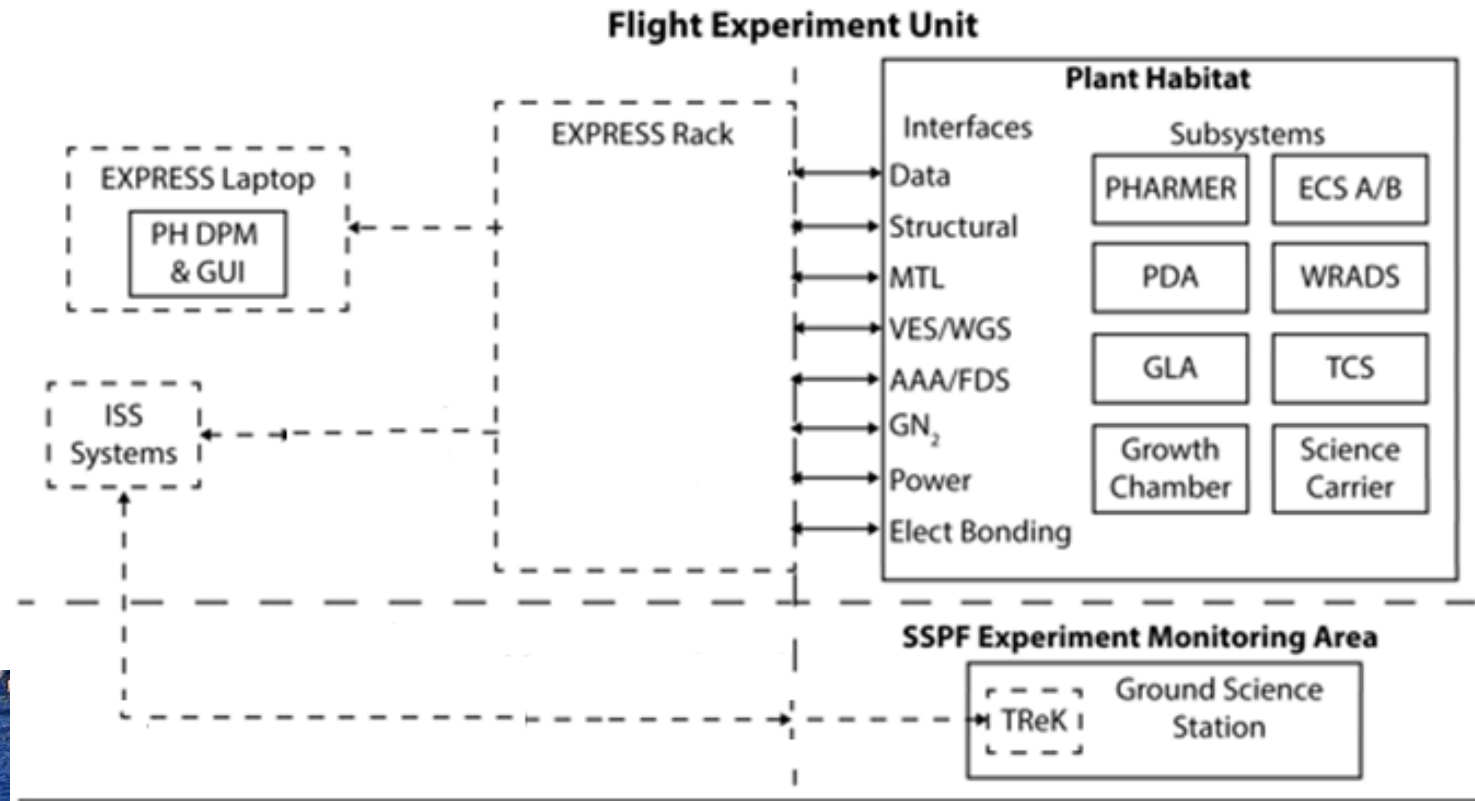

- Activated APH 19Jan18
- Initiated First Plant Test on 22Jan18 - verify that science is supported on APH hardware.
 - Install pre-planted SC: WT Arabidopsis and Apogee semi-dwarf wheat
 - Two week growth of WT Arabidopsis and 33 days of wheat conducted to demonstrate adequate plant growth for future science experiments.
 - Demonstrate and evaluate performance of on-orbit watering protocols.
- WT Arabidopsis – verify planting protocols of PH-01 Experiment.
- Wheat Plants – provide a biological ‘load’ on the system.
- Demonstrate on-orbit watering protocol.
- Demonstrate on-orbit germination / harvest protocols.
- Demonstrate experiment profile scripts

IR 0-50 $\mu\text{mol m}^{-2} \text{s}^{-1}$ at 735 nm ± 10 nm

W 0-600 $\mu\text{mol m}^{-2} \text{s}^{-1}$ at 400-700 nm

APH Science Carrier

- Four quadrants – independent moisture control
- Baseline – TRL-9 porous substrate / slow release fertilizer
- Pre-planted / Contains water and substrate

Planting and Germination

planting protocols (**launch vibration**):

- Preparing the planting media, foam – sift, autoclave
- **Packing (legacy to Mir, BPS)**
- Seeding the SC (immobilize seeds).

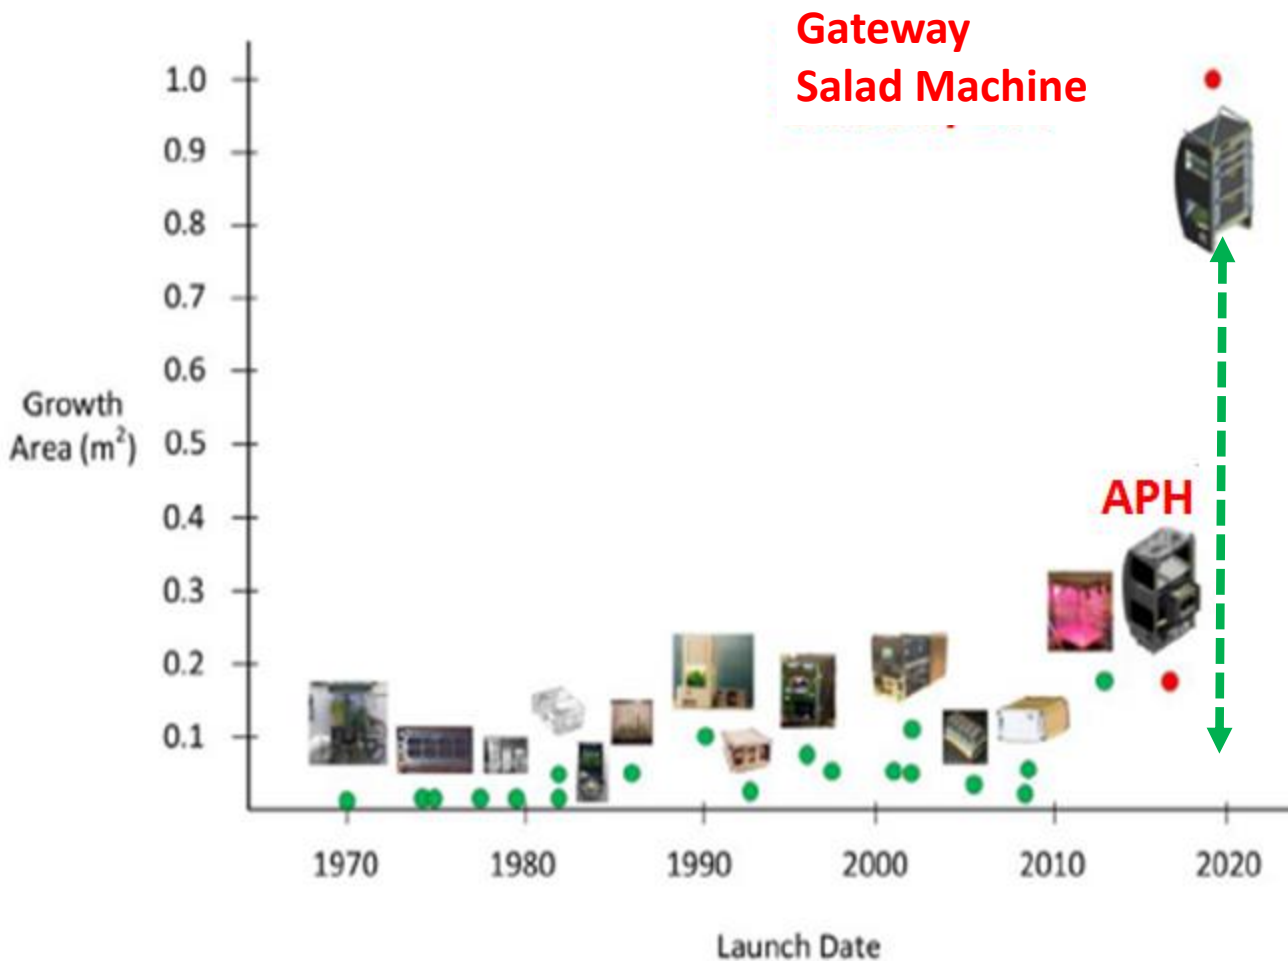

germination protocols:

- Seed sterilization
- **Determining the wicking system used to germinate seeds**
- **Determine environmental conditions to ensure germination**
- Thinning as needed

Context: Spaceflight Plant Growth Systems

APH – current capabilities

- Automated substrate-based watering system – 0.2 m² - Active
- Cultural Conditions
 - LED lighting: 0 to 1000 $\mu\text{mol}/\text{m}^2\text{s}$, photoperiod
 - Spectral bands: white, blue, green, red, far red
 - Environmental control: CO₂, T_{air}, RH, soil moisture, ventilation
 - Teleoperation via commanding: manual mode, scripts, real time GUI
 - Crew tended functions: planting, harvest, sensors, maintenance
 - Imagery: aerial growth rates, health, watering, food safety - hyperspectral

Future Studies – deep space

- Watering system:
 - microgravity independent, reusable, modular, light weight, no substrate
- Autonomous:
 - firmware, troubleshooting, scheduler, robotic farmer arms, AI
- Crew/Inputs:
 - installation, sample return, consumer, fertilizer, seeds, water
- Enable Science:
 - Platform for molecular tests, fundamental biology
 - radiation exposure, crop production rates, food quality

APH commanding logs are data for designing a 'fully' automated plant chamber

Space farming is multidisciplinary – science, engineers, robotics

APH Facility – First Plant Test

Arabidopsis (Quadrants 2 & 3) initiated on 1/22/18.

Apogee wheat (Quadrants 1 & 4) Initiated on 2/7-8/18.

Feb 22, 26, harvest Mar 6, 9, 12 2018 - Arabidopsis harvested on Mar 6 – observed debris containment. Apogee wheat (Quadrants 1 & 4) was 32 days old on Mar12.

Nondestructive data – Gas exchange

- APH measures nondestructive growth data – C fluxes.
- Example: CO₂ Response Curves from 20 day old wheat

CO₂ Drawdown Technique:

- Change the light level, disable CO₂ control, and photosynthesis consumes chamber CO₂ - drawdown.
- Allows Light response curves to be measured as well.
- Daily Growth – Lights come on.

ISS 2002 - BPS – Biomass Production System

PESTO - Photosynthesis Experiment Subsystem Testing and Operations - PI_G. Stutte

Daily CO₂ DrawDown Data

Monje et al. Planta (2005)

Measuring CO₂ and light response curves of wheat plants in microgravity

- Wheat harvest was conducted by removing the SC - Astronaut Norishige “Nemo” Kanai

Conclusions

- APH Facility was installed, assembled and validated for conducting plant research on ISS.
- Two species – Wheat and Arabidopsis plants were successfully grown from seed and harvested after 30 days of growth on ISS.
- Validated planting, germination and watering protocols.
- Collected environmental data and nondestructive plant growth data.
- Hardware supports science.

Go APH!

Acknowledgements

APH was sponsored by NASA's ISS Program and Space Life and Physical Sciences Research and Applications Division (SLPSRA) and co-developed by NASA and Sierra Nevada Corp. (formerly ORBITEC) of Madison, Wisconsin.

APH is available to support SLPSRA selected fundamental biology plus U.S. National Laboratory investigations sponsored by the Center for the Advancement of Science in Space.
