

# The current volatility in house prices hurts the whole economy – we need solutions that will provide stability and affordability for home owners

Blog Admin

*Britain's model of home ownership is under severe strain. House price volatility has become the constant – and delinquent - companion of the UK economy. It has affected economic policy at the highest level, most notably the decision not to join the Euro in 2003. With four boom and bust cycles since 1970 we have yet to learn the lessons from past recessions so that we can change the record and inject more stability into the UK housing system, argues **Professor Mark Stephens**, as [The Joseph Rowntree Foundation Housing Market Taskforce](#) set out to change the record and look for solutions that could smooth the housing market cycle*

## So why does volatility matter?

The uncertainty generated by house price volatility affects us all. For individuals there is a temptation to overextend borrowing, in a boom with 8.5 percent of mortgagors in negative equity. House building is disrupted by these cycles with the lowest rate of house building since 1923. For lenders the risk of creating an unsustainable house price bubble looms large, and for the Government, housing market recessions necessitate costly knee jerk policy reactions.

This volatility increases risks as the housing market interacts with the economic cycle. The spectre of redundancy still looms large in the UK economy with [100 families a day being repossessed](#) in the first quarter of 2011.

Volatility also inhibits labour mobility with around 2 million households unable to move at the end of 2008 due to having limited or no equity. People are priced out of growth areas in booms and locked them into properties in downturns. As Figure 1 shows, the last cycle disconnected some [local housing markets](#) so far from the national picture, distorting this picture still further.

**Figure 1: Regional house price increases: difference from UK average, 1969-2009**

Private renting has expanded and helped to meet the gap, but is itself subject to volatility with between 11,000 and 18,500 private tenant households subject to repossession each year simply because their tenancy has expired. Meanwhile buy-to-let repossession rates run at remarkably [similar levels to home-owners](#) (table 600). Lack of affordability in the market sectors places further pressure on the social sector, with 1.8 million households on council waiting lists.

## Home ownership is driving inequality

The changing profile of home owners has stretched the UK model of home ownership beyond its limits. Home-ownership is being turned into the engine of inequality between generations as the young – and now not so young – pay for the wealth accumulation of older people. The reliance on parental assistance entrenches the economic privilege of the children of the better off.

Whilst home ownership has fallen most among the youngest age cohorts, as Figure 2 shows, the fact that it now affects those in middle age gives us even more cause to worry. We cannot be sure that those who are buying later will 'catch up' potentially leaving us with an increase in pensioner poverty and a welfare headache. Currently the lack of housing costs reduces pensioner poverty from 20.4 per cent to 16 per cent.

### The role of housing policy

Housing policy shouldn't distort people's tenure choices or set targets for specific housing tenures. However it can focus on longer term solutions that will deliver:

- Enough housing of the right type in the right places. This allows people to choose different forms of tenure based on what is best suited to their circumstances.
- Greater fairness between households and generations. Achieving lower price inflation and greater stability in the housing market will better protect existing home-owners, help new households to access housing and provide a more certain outlook for developers and housing providers.
- An improved safety net based on shared responsibility between borrowers and lenders. Decisions should not be risk free, but the Government can establish a framework through which people receive better protection from risks that are exacerbated by the housing market cycle.

### Solutions to achieve stability: supply, taxation and safety nets

Supply is key to tackling both volatility and affordability across the market. However, at current building rates the ratio of lower quartile house prices to income will rise to 10.9 in 2026. It is essential therefore that the planning system facilitates appropriate new development. The planning system must provide sufficient incentives to increase supply. Measures such as land auctions and over-provisioning of permissions may play a role here. While most new development will come from the private sector, social rented housing still has an important role to play.

Since supply is a long-term solution, we must also look to more short run ways of managing volatility. As Spain and Ireland demonstrate, increasing housing supply on its own doesn't create immunity from boom/bust cycles. Credit controls could provide a useful tool. For example, time limited maximum loan-to-value ratios could prevent credit fuelling unsustainable house price booms. The reform of property taxation could also play an important role here. There is an overwhelming case for reforming the structure of [Stamp Duty](#) by replacing its current 'slab' structure with a 'slice' structure. By uprating thresholds automatically every year, it could also exert a counter-cyclical influence on the market.

[Council Tax](#) is also ripe for reform. It could better to reflect changes in property values, first through revaluation (as has [occurred in Wales](#)). 3.7 million households in England are worse off as a result of the failure to revalue bands. Second, moving to a 'point value' structure (as has been [adopted in Northern Ireland](#)). This would also improve fairness between places: Londoners pay only 0.36 per cent of property values in council tax despite London house prices being 144 per cent of the average house price. Finally, a national property tax requiring the restructuring of local authority funding could be created. This would require careful planning but the abolition of mortgage interest relief shows that taxation reform is possible.

Better safety nets also need to be developed to protect owners from the consequences of volatility. This should involve:

- measures to improve individuals' financial capability, for example by extending the work of the [Money Advice Service](#);
- responsible lending and we broadly support the FSA's proposals for basing lending on affordability assessments, though believe that the evidence needs to be more transparent; and
- an overhaul of the current unsatisfactory safety nets to protect owners when they experience loss of income, perhaps on the basis of a compulsory partnership insurance model. This would involve contributions from borrowers, lenders and government used to purchase block insurance to provide time-limited non means-tested support for capital and interest payments in the event of loss of income due to redundancy, failed self-employment or sickness. It would also fund means-tested assistance for non-designated risks and for longer-term need.

It is clear that volatility can be tackled only by looking across the system as a whole. While it is always easier to postpone difficult decisions, one thing is certain. If volatility is not tackled now, we shall enter yet another cycle of boom and bust.
